Record the gamma-ray spectrum using a suitable instrument calibrated with the aid of standardised cobalt-58, cobalt-57 and cobalt-60 solutions. The spectrum does not differ significantly from that of the standardised cobalt-58 solution. Standardised cobalt-58, cobalt-57 and cobalt-60 solutions are available from laboratories recognised by the competent authority. Determine the relative amounts of cobalt-58, cobalt-57 and cobalt-60 present. Cobalt-57 has a half-life of 272 days and its presence is shown by gamma photons of energy 0.122 MeV. Cobalt-60 has a half-life of 5.27 years and its presence is shown by gamma photons of energies 1.173 MeV and 1.333 MeV. Not more than 1 per cent of the total radioactivity is due to cobalt-60 and not more than 2 per cent of the total radioactivity is due to cobalt-57, cobalt-60 and other radionuclidic impurities.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve the contents of a capsule in 1.0 ml of *water R* and allow to stand for 10 min. Centrifuge at 2000 r/min for 10 min. Use the supernatant.

Reference solution. Dissolve 10 mg of *cyanocobalamin CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 2 ml of the solution to 100 ml with the mobile phase. Use within 1 h of preparation.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: mix 26.5 volumes of *methanol R* and 73.5 volumes of a 10 g/l solution of *disodium hydrogen phosphate R*, adjusted to pH 3.5 with *phosphoric acid R* and use within 2 days,
- a radioactivity detector adjusted for cobalt-58,
- as detector a spectrophotometer set at 361 nm,
- a loop injector.

Inject 100 µl of the test solution and record the chromatogram for three times the retention time of cyanocobalamin. Determine the peak areas and calculate the percentage of cobalt-58 present as cyanocobalamin. Inject 100 µl of the reference solution and record the chromatogram for 30 min.

RADIOACTIVITY

The average radioactivity determined in the test for uniformity of content is not less than 90.0 per cent and not more than 110.0 per cent of the declared cobalt-58 radioactivity, at the date stated on the label.

STORAGE

Store in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

01/2005:0270

CYANOCOBALAMIN (^{58}Co) SOLUTION**Cyanocobalamini (^{58}Co) solutio****DEFINITION**

Cyanocobalamin (^{58}Co) solution is a solution of [^{58}Co]- α -(5,6-dimethylbenzimidazol-1-yl)cobamide cyanide and may contain a stabiliser and an antimicrobial preservative. Cobalt-58 is a radioactive isotope of cobalt and may be produced by neutron irradiation of nickel. Cyanocobalamin (^{58}Co) may be prepared by the growth of suitable micro-organisms on a medium containing (^{58}Co) cobaltous ion. The solution contains not less than 90.0 per cent and not more than 110.0 per cent of the declared cobalt-58 radioactivity at the date stated on the label. Not less than 90 per cent of the cobalt-58 is in the form of cyanocobalamin.

CHARACTERS

A clear, colourless or slightly pink solution.

Cobalt-58 has a half-life of 70.8 days and emits beta (β^+) radiation and gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised cobalt-58 solution. Standardised cobalt-58, cobalt-57 and cobalt-60 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons of cobalt-58 have energies of 0.511 MeV (annihilation radiation) and 0.811 MeV.
- B. Examine the chromatograms obtained in the test for radiochemical purity. The principal peak in the radiochromatogram obtained with the solution to be examined has a retention time similar to that of the peak in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3). The pH of the solution is 4.0 to 6.0.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument having adequate resolution and calibrated with the aid of standardised cobalt-58, cobalt-57 and cobalt-60 solutions. The spectrum does not differ significantly from that of the standardised cobalt-58 solution. Determine the relative amounts of cobalt-58, cobalt-57 and cobalt-60 present. Cobalt-57 has a half-life of 271 days and its presence is shown by gamma photons of energy 0.122 MeV. Cobalt-60 has a half-life of 5.27 years and its presence is shown by gamma photons of energies 1.173 MeV and 1.332 MeV. Not more than 1 per cent of the total radioactivity is due to cobalt-60 and not more than 2 per cent of the total radioactivity is due to cobalt-57, cobalt-60 and other radionuclidic impurities.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (2.2.29).

Reference solution. Dissolve 10 mg of *cyanocobalamin CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 2 ml of the solution to 100 ml with the mobile phase. Use within 1 h.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 μm),

- as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: mix 26.5 volumes of *methanol R* and 73.5 volumes of a 10 g/l solution of *disodium hydrogen phosphate R* adjusted to pH 3.5 using *phosphoric acid R* and use within 2 days,
- a radioactivity detector adjusted for cobalt-58,
- as detector a spectrophotometer set at 361 nm,
- a loop injector.

Inject 100 μl of the solution to be examined and record the chromatogram for three times the retention time of cyanocobalamin. Determine the peak areas and calculate the percentage of cobalt-58 present as cyanocobalamin. Inject 100 μl of the reference solution and record the chromatogram for 30 min.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised cobalt-58 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light at a temperature of 2 °C to 8 °C.

01/2005:1325

FLUDEOXYGLUCOSE (^{18}F) INJECTION**Fludeoxyglucosi (^{18}F) solutio iniectionis****DEFINITION**

Fludeoxyglucose (^{18}F) injection is a sterile solution of 2- ^{18}F]fluoro-2-deoxy-D-glucopyranose (2- ^{18}F]fluoro-2-deoxy-D-glucose) for diagnostic use. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label. Not less than 95 per cent of the radioactivity corresponds to fluorine-18 in the form of 2- ^{18}F]fluoro-2-deoxy-D-glucose and 2- ^{18}F]fluoro-2-deoxy-D-mannose, with the 2- ^{18}F]fluoro-2-deoxy-D-mannose fraction not exceeding 10 per cent of the total radioactivity. Not less than 99.0 per cent of the radioactivity corresponds to fluorine-18. The content of 2-fluoro-2-deoxy-D-glucose is not more than 10 mg per maximum recommended dose of injection.

PRODUCTION**RADIONUCLIDE PRODUCTION**

Fluorine-18 is a radioactive isotope of fluorine which may be produced by various nuclear reactions induced by proton irradiation of oxygen-18, deuteron irradiation of neon-20, helium-3 or helium-4 irradiation of oxygen-16.

RADIOCHEMICAL SYNTHESIS

2- ^{18}F]Fluoro-2-deoxy-D-glucose may be prepared by various chemical synthetic pathways, which lead to different products in terms of specific radioactivity, by-products and possible impurities.

Most widely used is the method of phase transfer catalysed nucleophilic substitution of 1,3,4,6-tetra-*O*-acetyl-2-*O*-trifluoromethanesulphonyl- β -D-mannopyranose with [^{18}F]fluoride. Generally, [^{18}F]fluoride is adsorbed on an anion-exchange resin and eluted with a solution of potassium carbonate which is then evaporated to dryness. Addition of a phase transfer catalyst such as an aminopolyether in dry acetonitrile may be used to enhance the nucleophilicity of the [^{18}F]fluoride so that it reacts easily with the tetra-acetylated mannosyltriflate at elevated temperature. Hydrolysis under either alkaline or acidic conditions yields 2-[^{18}F]fluoro-2-deoxy-D-glucose. Hydrolysis using hydrochloric acid may lead to the formation of 2-chloro-2-deoxy-D-glucose. Hydrolysis under alkaline conditions may lead to the formation of 2-[^{18}F]fluoro-2-deoxy-D-mannose as a by-product.

Variations of the method substitute the aminopolyether by a tetra-alkyl ammonium salt, or use solid phase catalysed nucleophilic substitution on derivatised anion-exchange resin, e.g. derivatised with 4-(4-methylpiperidino)pyridine.

Electrophilic pathways for production of 2-[^{18}F]fluoro-2-deoxy-D-glucose proceed by the reaction of molecular [^{18}F]fluorine or [^{18}F]acetylhypofluorite with 3,4,6-tri-*O*-acetyl-D-glucal. [^{18}F]Acetylhypofluorite is obtained by conversion of molecular [^{18}F]fluorine on a solid complex of acetic acid and potassium acetate. The production of molecular [^{18}F]fluorine requires the addition of small amounts of fluorine to the neon target gas, usually from 0.1 per cent to 1 per cent, resulting in the reduction of the specific radioactivity of the end-product. Hydrolysis of the *O*-acetyl protected [^{18}F]fluorinated sugar yields 2-[^{18}F]fluoro-2-deoxy-D-glucose and usually small amounts of 2-[^{18}F]fluoro-2-deoxy-D-mannose.

The preparation can be purified by serial chromatography on combinations of ion-retardation resin, ion-exchange resin, alumina and octadecyl derivatised silica gel. Removal of the phase transfer catalyst can be achieved by different methods, all using combinations of separation cartridges.

Production systems and their performance comply with the requirements set by the competent authority.

STARTING MATERIALS

1. Target materials

Each batch of target material must be tested in special production runs before its use in routine fluorine-18 production and manufacture of the preparation, to ensure that under specified conditions, the target yields fluorine-18 in the desired quantity and quality.

2. Precursors for organic synthesis

It is recommended to test the precursors in production runs before their use for the manufacture of the preparation, to ensure that under specified production conditions, the precursors yield the preparation in the desired quantity and quality.

1,3,4,6-Tetra-*O*-acetyl-2-*O*-trifluoromethanesulphonyl- β -D-mannopyranose. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur.* reference spectrum of 1,3,4,6-tetra-*O*-acetyl-2-*O*-trifluoromethanesulphonyl- β -D-mannopyranose.

Melting point (2.2.14): 119 °C to 122 °C.

3,4,6-Tri-*O*-acetyl-D-glucal. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur.* reference spectrum of 3,4,6-tri-*O*-acetyl-D-glucal.

Melting point (2.2.14): 53 °C to 55 °C.

CHARACTERS

A clear, colourless or slightly yellow solution.

Fluorine-18 has a half-life of 109.8 min and emits positrons with a maximum energy of 0.633 MeV, followed by annihilation gamma radiation of 0.511 MeV.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The only gamma photons have an energy of 0.511 MeV; and depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.
- It complies with the test for radionuclidic purity (see Tests).
- Examine the chromatograms obtained in test (a) for radiochemical purity. The principal peak in the radiochromatogram obtained with the test solution has approximately the same retention time as the principal peak in the chromatogram obtained with reference solution (b).

TESTS

pH (2.2.3). The pH of the injection is 4.5 to 8.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175/V IU/ml, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

CHEMICAL PURITY

Particular tests for chemical purity may be omitted if the substances mentioned are not used or cannot be formed in the production process

(a) 2-Fluoro-2-deoxy-D-glucose and 2-chloro-2-deoxy-D-glucose. Examine by liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

Reference solution (a). Dissolve 10 mg of glucose R in water R and dilute to 100 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of 2-fluoro-2-deoxy-D-glucose R in water R and dilute to V with the same solvent, V being the maximum recommended dose in millilitres.

Reference solution (c). Dissolve 1.0 mg of 2-chloro-2-deoxy-D-glucose R in water R and dilute to 2.0 ml with the same solvent. Dilute 1 ml of this solution to V with the same solvent, V being the maximum recommended dose in millilitres.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.0 mm in internal diameter packed with *strongly basic anion-exchange resin for chromatography R* (10 μm),
- as mobile phase at a flow rate of 1 ml/min 0.1 M sodium hydroxide protected against contamination by carbon dioxide,
- a suitable radioactivity detector for radiochemical purity testing,
- a detector suitable for carbohydrates in the required concentration range,
- a loop injector,

maintaining the column at a constant temperature between 20 °C and 30 °C.

Equilibrate the column with the mobile phase until a stable baseline is achieved.

Inject separately reference solutions (a), (b) and (c).

If the validation studies exclude the formation of 2-chloro-2-deoxy-D-glucose inject separately reference

solutions (a) and (b). Continue the chromatography for twice the retention time of D-glucose, 2-fluoro-2-deoxy-D-glucose and when required, 2-chloro-2-deoxy-D-glucose respectively.

Inject the test solution. The chromatogram obtained with the detector for carbohydrates shows a principal peak corresponding to D-glucose (test solutions from nucleophilic pathways) or 2-fluoro-2-deoxy-D-glucose (test solutions from electrophilic pathways). When the chromatograms are recorded in the prescribed conditions, 2-chloro-2-deoxy-D-glucose elutes after 2-fluoro-2-deoxy-D-glucose, but their corresponding peaks may not be completely resolved. In the chromatogram obtained with the test solution, the areas of the peaks corresponding to 2-fluoro-2-deoxy-D-glucose and 2-chloro-2-deoxy-D-glucose are not greater than the areas of the peaks in the chromatograms obtained with reference solution (b) and/or reference solution (c) (10 mg of 2-fluoro-2-deoxy-D-glucose per V and 0.5 mg of 2-chloro-2-deoxy-D-glucose per V respectively).

(b) Aminopolyether. This test is performed only on the bulk solution before addition of sodium chloride by the producer and it is not intended for the final preparation to be injected. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. The preparation to be examined.

Reference solution. Dissolve 0.110 g of *aminopolyether R* in *water R* and dilute to 10.0 ml with the same solvent. Dilute 0.2 ml of this solution to V with the same solvent, V being the maximum recommended dose in millilitres.

Apply separately to the plate 2 μl of the test solution and 2 μl of the reference solution. Develop over a path of about 8 cm using a mixture of 1 volume of *ammonia R* and 9 volumes of *methanol R*. Allow the plate to dry in air for 15 min. Expose the plate to iodine vapour for at least 10 min. In the chromatogram obtained with the test solution the spot corresponding to aminopolyether is not more intense than the spot in the chromatogram obtained with the reference solution (2.2 mg per V).

(c) Tetra-alkyl ammonium salts. Examine by liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

Reference solution. Dilute 2.1 ml of 0.1 *M* *tetrabutylammonium hydroxide* to 20 ml with *water R*. Dilute 1 ml of this solution to V with the same solvent, V being the maximum recommended dose in millilitres.

The chromatographic procedure may be carried out using:

- a column 0.125 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μm),
 - as mobile phase at a flow rate of 0.6 ml/min a mixture of 25 volumes of a 0.95 g/l solution of *toluenesulphonic acid R* and 75 volumes of *acetonitrile R*,
 - as detector a spectrophotometer set at 254 nm,
 - a loop injector,
- maintaining the column at a constant temperature between 20 °C and 30 °C.

Equilibrate the column with the mobile phase until a stable baseline is obtained.

Inject the reference solution. Continue the chromatography for twice the retention time of tetrabutylammonium ions.

Inject the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to tetrabutylammonium ions is not greater than the area of the peak in the chromatogram obtained with the reference solution (2.75 mg per V).

(d) Solid phase derivatisation agent 4-(4-methylpiperidino)pyridine. Examine by ultraviolet spectrophotometry (2.2.25).

Test solution. The preparation to be examined.

Reference solution. Dissolve 20 mg of 4-(4-methylpiperidino)pyridine *R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 0.1 ml of this solution to V with the same solvent, V being the maximum recommended dose in millilitres.

Measure the absorbance of the test solution and the reference solution at the maximum of 263 nm. The absorbance of the test solution is not greater than that of the reference solution (0.02 mg per V).

(e) Residual solvents (2.4.24). The concentration of acetonitrile does not exceed 4.1 mg per V , V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The half-life is between 105 min and 115 min. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

A. Examine by liquid chromatography (2.2.29) as described in test (a) for chemical purity.

When the chromatograms obtained with the radioactivity detector are recorded in the prescribed conditions, the principal peak in the chromatogram obtained with the test solution has the same retention time as the peak obtained with reference solution (b) using the carbohydrate detector. The retention times of 2- ^{18}F fluoro-2-deoxy-D-mannose and ^{18}F fluoride are approximately 90 per cent and approximately 50 per cent of that of 2- ^{18}F fluoro-2-deoxy-D-glucose respectively. Other peaks in the chromatogram may be due to partially acetylated 2- ^{18}F fluoro-2-deoxy-D-glucose derivatives.

Calculate the percentage content of ^{18}F fluorinated substances from the areas of the peaks in the chromatogram obtained with the test solution. The sum of the percentages of radioactivity corresponding to 2- ^{18}F fluoro-2-deoxy-D-glucose and 2- ^{18}F fluoro-2-deoxy-D-mannose is not less than 95 per cent of the total radioactivity with the 2- ^{18}F fluoro-2-deoxy-D-mannose fraction not exceeding 10 per cent of the total radioactivity.

The method may underestimate or miss unhydrolysed or partially hydrolysed 2- ^{18}F fluoro-2-deoxytetra-acetyl-D-glucose, since these intermediate reaction products may further hydrolyse to the desired end-product under the chromatographic conditions.

B. Examine by thin-layer chromatography (2.2.27) using a *TLC silica gel plate R*.

Test solution. The preparation to be examined.

Apply 2 μl to 10 μl to the plate. Develop over a path of 8 cm using a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R*. Allow the plate to dry in air for 15 min. Determine the distribution of radioactivity using a suitable detector. Not less than 95 per cent of the total radioactivity is found in the spot corresponding to 2-fluoro-2-deoxy-D-glucose (R_f about 0.45).

Possible contaminants are ^{18}F fluoride (R_f 0.0); partially acetylated 2- ^{18}F fluoro-2-deoxy-D-glucose derivatives (R_f about 0.8-0.95).

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised fluorine-18 solution or using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions are available from laboratories recognised by the competent authority.

LABELLING

The accompanying information specifies the particular synthetic pathway of production. The label on the actual container states the maximum recommended dose in millilitres.

01/2005:1917

FLUMAZENIL (*N*-[¹¹C]METHYL) INJECTION

Flumazenil (*N*-[¹¹C]methyl)
solutio iniectionis

DEFINITION

Sterile solution of ethyl 8-fluoro-5-[¹¹C]methyl-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylate which may contain a stabiliser such as ascorbic acid.

Content: 90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

Content of flumazenil: maximum 50 µg in the maximum recommended dose in millilitres.

PRODUCTION

RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon which is most commonly produced by proton irradiation of nitrogen. Depending on the addition of either trace amounts of oxygen or small amounts of hydrogen, the radioactivity is obtained as [¹¹C]carbon dioxide or [¹¹C]methane, respectively.

RADIOCHEMICAL SYNTHESIS

[5-Methyl-¹¹C]flumazenil may be prepared by *N*-alkylation of ethyl 8-fluoro-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylate (demethylflumazenil) with iodo[¹¹C]methane or [¹¹C]methyl trifluoromethanesulphonate.

Synthesis of iodo[¹¹C]methane

Iodo[¹¹C]methane may be produced from [¹¹C]carbon dioxide or from [¹¹C]methane. The most frequently used method is reduction of [¹¹C]carbon dioxide with lithium aluminium hydride. The [¹¹C]methanolate formed is reacted with hydriodic acid. Alternatively [¹¹C]methane, either obtained directly in the target or by on-line processes from [¹¹C]carbon dioxide, is reacted with iodine.

Synthesis of [¹¹C]methyl trifluoromethanesulphonate

[¹¹C]methyl trifluoromethanesulphonate may be prepared from iodo[¹¹C]methane using a solid support such as graphitised carbon, impregnated with silver trifluoromethanesulphonate.

Synthesis of [5-methyl-¹¹C]flumazenil

The most widely used method to obtain [5-methyl-¹¹C]flumazenil is the *N*-alkylation of demethylflumazenil with iodo[¹¹C]methane in alkaline conditions in a solvent such as dimethylformamide or acetone. The resulting [5-methyl-¹¹C]flumazenil can be purified by semi-preparative liquid chromatography. For example, a column packed with octadecylsilyl silica gel for chromatography eluted with a mixture of ethanol and water is suitable.

PRECURSOR FOR SYNTHESIS

Demethylflumazenil

Melting point (2.2.14): 286 °C to 289 °C.

Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of demethylflumazenil.

CHARACTERS

Appearance: clear, colourless solution.

Half-life and nature of radiation of carbon-11: see Table of physical characteristics of radionuclides (5.7).

IDENTIFICATION

A. Gamma-ray spectrometry.

Results: the only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results: the principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

pH (2.2.3): 6.0 to 8.0.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175/V IU/ml, *V* being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

Flumazenil and impurity A. Liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

Reference solution (a). Dissolve 2.5 mg of flumazenil *R* in 5 ml of methanol *R*.

Reference solution (b). Dissolve 2.5 mg of demethylflumazenil *R* in 50 ml of methanol *R*.

Reference solution (c). To 0.1 ml of reference solution (a) add 0.1 ml of reference solution (b) and dilute to *V* with a 0.9 g/l solution of sodium chloride *R*, *V* being the maximum recommended dose in millilitres.

Reference solution (d). Dilute 0.1 ml of reference solution (a) to 50 ml with methanol *R*. Dilute 1.0 ml of this solution to *V* with a 0.9 g/l solution of sodium chloride *R*, *V* being the maximum recommended dose in millilitres.

Column:

- *size*: *l* = 0.15 m, Ø = 3.9 mm,
- *stationary phase*: spherical octadecylsilyl silica gel for chromatography *R* (5 µm) with a specific surface area of 440 m²/g, a pore size of 100 nm and a carbon loading of 19 per cent,

- *temperature*: maintain at a constant temperature between 20–30 °C.

Mobile phase: methanol R, water R (45:55 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 260 nm and radioactivity detector connected in series.

Injection: 100 µl.

Run time: 10 min.

Relative retention with reference to flumazenil: impurity A = about 0.74.

System suitability: reference solution (c):

- *resolution*: minimum 2.5 between the peaks due to flumazenil and impurity A.

Limits: examine the chromatogram obtained with the spectrophotometer:

- *flumazenil*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (50 µg/V),
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (5 µg/V),
- *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1 µg/V).

Residual solvents are limited according to the principles defined in the general chapter (5.4), using the general method (2.4.24). The preparation may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Carbon-11: minimum 99 per cent of the total radioactivity.

The preparation may be released for use before completion of the test.

A. Gamma-ray spectrometry.

Results: the spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 19.9 min to 20.9 min.

RADIOCHEMICAL PURITY

Liquid chromatography (2.2.29) as described in the test for flumazenil and impurity A, with the following modifications.

Injection: test solution and reference solution (a); if necessary, dilute the test solution to a radioactivity concentration suitable for the detector.

Limit: examine the chromatogram obtained with the radioactivity detector:

- [*5-methyl-¹¹C*]flumazenil: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states the maximum recommended dose in millilitres.

IMPURITIES

- A. R = H: ethyl 8-fluoro-6-oxo-5,6-dihydro-4H-imidazo[1,5-a][1,4]benzodiazepine-3-carboxylate (demethylflumazenil),
- B. R = CH₂-CO-CH₃: ethyl 8-fluoro-6-oxo-9-(2-oxopropyl)-5,6-dihydro-4H-imidazo[1,5-a][1,4]benzodiazepine-3-carboxylate (acetone addition compound of demethylflumazenil).

01/2005:0555

GALLIUM (⁶⁷Ga) CITRATE INJECTION

Gallii (⁶⁷Ga) citratis solutio iniectionis

DEFINITION

Gallium (⁶⁷Ga) citrate injection is a sterile solution of gallium-67 in the form of gallium citrate. It may be made isotonic by the addition of sodium chloride and sodium citrate and may contain a suitable antimicrobial preservative such as benzyl alcohol. Gallium-67 is a radioactive isotope of gallium and may be obtained by the irradiation, with protons of suitable energy, of zinc which may be enriched in zinc-68. Gallium-67 may be separated from zinc by solvent extraction or column chromatography. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared gallium-67 radioactivity at the date and hour stated on the label. Not more than 0.2 per cent of the total radioactivity is due to gallium-66.

CHARACTERS

A clear, colourless solution.

Gallium-67 has a half-life of 3.26 days and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised gallium-67 solution when measured either by direct comparison or by use of an instrument calibrated with the aid of such a solution. Standardised gallium-67 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons have energies of 0.093 MeV, 0.185 MeV and 0.300 MeV.
- B. To 0.2 ml of the injection to be examined add 0.2 ml of a solution containing 1 g/l of *ferric chloride R* and 0.1 per cent V/V of *hydrochloric acid R* and mix. Compare the colour with that of a solution containing 9 g/l of *benzyl alcohol R* and 7 g/l of *sodium chloride R* treated in the same manner. A yellow colour develops in the test solution only.

TESTS

pH (2.2.3). The pH of the injection is 5.0 to 8.0.

Zinc. To 0.1 ml of the injection to be examined add 0.9 ml of *water R*, 5 ml of *acetate buffer solution pH 4.7 R*, 1 ml of a 250 g/l solution of *sodium thiosulphate R* and 5.0 ml of a dithizone solution prepared as follows: dissolve 10 mg

of *dithizone R* in 100 ml of *methyl ethyl ketone R* allow to stand for 5 min, filter and immediately before use dilute the solution to ten times its volume with *methyl ethyl ketone R*. Shake vigorously for 2 min and separate the organic layer. Measure the absorbance (2.2.25) of the organic layer at 530 nm, using the organic layer of a blank solution as the compensation liquid. The absorbance is not greater than that of the organic layer obtained with 0.1 ml of *zinc standard solution (5 ppm Zn) R* treated in the same manner.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised gallium-67 solution, apart from any differences attributable to the presence of gallium-66. Gallium-66 has a half-life of 9.4 h and its most prominent gamma photon has an energy of 1.039 MeV. Not more than 0.2 per cent of the total radioactivity is due to gallium-66.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised gallium-67 solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:1922

HUMAN ALBUMIN INJECTION, IODINATED (¹²⁵I)

Iodinati (¹²⁵I) humani albumini solutio iniectabilis

DEFINITION

Sterile, endotoxin-free solution of human albumin labelled with iodine-125. It may contain a suitable buffer and an antimicrobial preservative. The human albumin used complies with the requirements of the monograph on *Human albumin solution (0255)*.

Content: 90 per cent to 110 per cent of the declared iodine-125 radioactivity at the date stated on the label.

Purity:

- minimum of 99.0 per cent of the total radioactivity corresponds to iodine-125,
- minimum of 80 per cent of the total radioactivity is associated with the albumin fractions II to V,
- maximum of 5 per cent of the total radioactivity corresponds to unbound iodide.

Content of albumin: 95 per cent to 105 per cent of the declared albumin content stated on the label.

CHARACTERS

Appearance: clear, colourless to yellowish solution.

Half-life and nature of radiation of iodine-125: see Table of physical characteristics of radionuclides (5.7).

IDENTIFICATION

A. Gamma-ray and X-ray spectrometry.

Comparison: standardised iodine-125 solution, or by using a calibrated instrument. Standardised iodine-125 solutions and/or standardisation services are available from the competent authority.

Results: the spectrum obtained with the preparation to be examined does not differ significantly from that obtained with a standardised iodine-125 solution, apart from any differences attributable to the presence of iodine-126. The most prominent photon has an energy of 0.027 MeV, corresponding to the characteristic X-ray of tellurium, gamma photons of an energy of 0.035 MeV are also present. Iodine-126 has a half-life of 13.11 days and its most prominent gamma photons have energies of 0.388 MeV and 0.666 MeV.

B. Examine by a suitable immunoelectrophoresis technique (2.7.1). Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted if necessary. The main component of the preparation to be examined corresponds to the main component of the normal human serum. The diluted solution may show the presence of small quantities of other plasma proteins.

TESTS

pH (2.2.3): 5.0 to 9.0.

Albumin

Reference solution. Dilute *human albumin solution R* with a 9 g/l solution of *sodium chloride R* to a concentration of 5 mg of albumin per millilitre.

To 1.0 ml of the preparation to be examined and to 1.0 ml of the reference solution add 4.0 ml of *biuret reagent R* and mix. After exactly 30 min, measure the absorbance (2.2.25) of each solution at 540 nm, using as the compensation liquid a 9 g/l solution of *sodium chloride R* treated in the same manner. From the absorbances measured, calculate the content of albumin in the injection to be examined in milligrams per millilitre.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*.

Bacterial endotoxins (2.6.14): less than 175/V IU/ml, V being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Iodine-125: minimum 99.0 per cent of the total radioactivity. Gamma-ray and X-ray spectroscopy.

Comparison: standardised solution of iodine-125.

Determine the relative amounts of iodine-125 and iodine-126 present.

RADIOCHEMICAL PURITY

Iodine-125 in albumin fractions II to V, iodine-125 corresponding to unbound iodide. Size-exclusion chromatography (2.2.30).

Test solution. Mix 0.25 ml of the preparation to be examined with 0.25 ml of the mobile phase. Use immediately after mixing.

Reference solution. *Human albumin solution R* or another appropriate human albumin standard diluted with the mobile phase to a suitable albumin concentration.

Column:

- size: $l = 0.6$ m, $\varnothing = 7.5$ mm,
- stationary phase: silica gel for size-exclusion chromatography R,
- temperature: 25 °C.

Mobile phase: dissolve 11.24 g of *potassium dihydrogen phosphate R*, 42.0 g of *disodium hydrogen phosphate R*, 11.70 g of *sodium chloride R* in 2000 ml of *water R*.

Flow rate: 0.6 ml/min.

Detection: spectrophotometer at 280 nm and radioactivity detector set for iodine-125 connected in series.

Injection: loop injector.

Run time: 85 min.

Retention times:

Peak No.	Fraction	Description of the compound	Retention time (min)
1	I	High molecular mass compound	18 - 20
2	II	Poly III albumin	23 - 24
3	III	Poly II albumin	25 - 26
4	IV	Poly I albumin	28
5	V	Human serum albumin	29 - 31
6	VI	Iodide	43 - 45

The main peak in the chromatogram obtained with the reference solution corresponds to fraction V.

Limits:

- *radioactivity in fractions II to V:* minimum 80 per cent of the total radioactivity applied to the column,
- *iodine-125 in fraction VI:* maximum 5 per cent of the total radioactivity.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised iodine-125 solution or by measurement with a calibrated instrument.

LABELLING

The label states:

- the amount of albumin,
- the maximum volume to be injected.

01/2005:1227

INDIUM (¹¹¹In) CHLORIDE SOLUTION

Indii (¹¹¹In) chloridi solutio

DEFINITION

Indium (¹¹¹In) chloride solution is a sterile solution of indium-111 as the chloride in aqueous hydrochloric acid containing no additives. Indium-111 is a radioactive isotope of indium and may be produced by the irradiation of cadmium with protons of suitable energy. The solution contains not less than 90.0 per cent and not more than 110.0 per cent of the declared indium-111 radioactivity at the date and hour stated on the label. Not more than 0.25 per cent of the total radioactivity is due to radionuclides other than indium-111. Not less than 95 per cent of the radioactivity corresponds to indium-111 in the form of ionic indium(III). The method of preparation is such that no carrier is added and the specific radioactivity is not less than 1.85 GBq of indium-111 per microgram of indium.

CHARACTERS

A clear, colourless solution.

Indium-111 has a half-life of 2.8 days and emits gamma radiation and X-rays.

IDENTIFICATION

- Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised indium-111 solution apart from any differences due to the presence of indium-114m, when measured either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons of indium-111 have energies of 0.171 MeV and 0.245 MeV.
- To 100 µl of *silver nitrate solution R2* add 50 µl of the solution. A white precipitate is formed.
- It complies with the test for pH (see Tests).
- Examine the chromatogram obtained in the test for radiochemical purity. The principal peak has an *R_f* value of 0.5 to 0.8.

TESTS

pH (2.2.3). The pH of the solution is 1.0 to 2.0.

Cadmium. Not more than 0.40 µg/ml, determined by electrothermal atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dilute 0.05 ml of the solution to be examined to a suitable volume with a suitable concentration of *hydrochloric acid R*.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R*, diluted as necessary with the same concentration of *hydrochloric acid R* as in the solution to be examined.

Measure the absorbance at 228.8 nm using a cadmium hollow-cathode lamp as source of radiation.

Copper. Not more than 0.15 µg/ml, determined by electrothermal atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dilute 0.1 ml the solution to be examined to a suitable volume with a suitable concentration of *hydrochloric acid R*.

Reference solutions. Prepare the reference solutions using *copper standard solution (0.1 per cent) R* diluted as necessary with the same concentration of *hydrochloric acid R* as the solution to be examined.

Measure the absorbance at 324.8 nm using a copper hollow-cathode lamp as source of radiation.

Iron. Not more than 0.60 µg/ml, determined by electrothermal atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dilute 0.1 ml of the solution to be examined to a suitable volume with a suitable concentration of *hydrochloric acid R*.

Reference solutions. Prepare the reference solutions using *iron standard solution (0.1 per cent Fe) R* diluted as necessary with the same concentration of *hydrochloric acid R* as the solution to be examined.

Measure the absorbance at 248.3 nm using an iron hollow-cathode lamp as source of radiation.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The solution may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised solution of indium-111 apart from any differences due to the presence of indium-114m.

Indium-114m. Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay. Take a volume equivalent to 30 MBq and record the gamma-ray spectrum using a suitable detector with a shield of lead, 6 mm thick, placed between the sample and the detector. The response in the region corresponding to the 0.558 MeV photon and the 0.725 MeV photon of indium-114m does not exceed that obtained using 75 kBq of a standardised solution of indium-114m (0.25 per cent) measured under the same conditions, when all measurements are calculated with reference to the date and hour of administration. Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Apply to the plate 5 μl of the solution to be examined. Develop immediately over a path of 15 cm using a 9.0 g/l solution of *sodium chloride R* adjusted to $\text{pH } 2.3 \pm 0.05$ with *dilute hydrochloric acid R*. Allow the plate to dry in a current of cold air. Determine the distribution of radioactivity using a suitable detector. Indium-111 chloride migrates with an R_f value of 0.5 to 0.8. Not less than 95 per cent of the total radioactivity of the chromatogram corresponds to indium-111 chloride.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised indium-111 solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:1109

INDIUM (^{111}In) OXINE SOLUTIONIndii (^{111}In) oxini solutio $\text{C}_{27}\text{H}_{18}[^{111}\text{In}]\text{N}_3\text{O}_3$ M_r 547.2**DEFINITION**

Indium (^{111}In) oxine solution is a sterile solution of indium-111 in the form of a complex with 8-hydroxyquinoline. It may contain suitable surface active agents and may be made iso-tonic by the addition of sodium chloride and a suitable buffer. Indium-111 is a radioactive isotope of indium and may be produced by the irradiation of cadmium with protons of suitable energy. The solution contains not less than 90.0 per cent and not more than 110.0 per cent of the declared indium-111 radioactivity at the date and hour stated on the

label. Not more than 0.25 per cent of the total radioactivity is due to radionuclides other than indium-111. Not less than 90 per cent of the radioactivity corresponds to indium-111 complexed with oxine. The method of preparation is such that no carrier is added and the specific radioactivity is not less than 1.85 GBq of indium-111 per microgram of indium.

CHARACTERS

A clear, colourless solution.

Indium-111 has a half-life of 2.8 days and emits gamma radiation and X-rays.

IDENTIFICATION

- Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised indium-111 solution apart from any differences due to the presence of indium-114m, when measured either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons of indium-111 have energies of 0.171 MeV and 0.245 MeV.
- Place 5 mg to 10 mg of *magnesium oxide R* in a glass container of approximately 20 mm in internal diameter. Add 20 μl of the solution to be examined. Examine in ultraviolet light at 365 nm. Bright yellow fluorescence is produced.
- The distribution of radioactivity between the organic and aqueous phases in the test for radiochemical purity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the solution is 6.0 to 7.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The solution may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised solution of indium-111, apart from any differences due to the presence of indium-114m.

Indium-114m. Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay. Take a volume equivalent to 30 MBq and record the gamma-ray spectrum using a suitable detector with a shield of lead, 6 mm thick, placed between the sample and the detector. The response in the region corresponding to the 0.558 MeV photon and the 0.725 MeV photon of indium-114m does not exceed that obtained using 75 kBq of a standardised solution of indium-114m (0.25 per cent) measured under the same conditions, when all measurements are calculated with reference to the date and hour of administration. (It should be noted that indium (^{111}In) oxine solution is a precursor used in the *in vitro* labelling of white blood cells or platelets prior to their re-injection into the patient. It is not intended for direct administration). Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority.

RADIOCHEMICAL PURITY

To a silanised separating funnel containing 3 ml of a 9 g/l solution of *sodium chloride R* add 100 μl of the solution to be examined and mix. Add 6 ml of *octanol R* and shake

vigorously. Allow the phases to separate and then run the lower layer into a suitable vial for counting. Allow the upper layer to drain completely into a similar vial. Add 1 ml of *octanol R* to the funnel, shake vigorously and drain into the vial containing the organic fraction. Add 5 ml of *dilute hydrochloric acid R* to the funnel, shake vigorously and drain these rinsings into a third vial. Seal each vial and, using a suitable instrument, measure the radioactivity in each. Calculate the radiochemical purity by expressing the radioactivity of the indium-111 oxine complex, found in the organic phase, as a percentage of the radioactivity measured in the three solutions. Not less than 90 per cent of the radioactivity corresponds to indium-111 complexed with oxine.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised indium-111 solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:0670

INDIUM (¹¹¹In) PENTETATE INJECTION

Indii (¹¹¹In) pentetatis solutio iniectionabilis

DEFINITION

Indium (¹¹¹In) pentetate injection is a sterile and apyrogenic solution containing indium-111 in the form of indium diethylenetriaminepenta-acetate. It may contain calcium and may be made isotonic by the addition of sodium chloride and a suitable buffer. Indium-111 is a radioactive isotope of indium which may be obtained by proton irradiation, of appropriate energy, of cadmium which may be enriched with cadmium-111 or cadmium-112. The injection contains not less than 90 per cent and not more than 110 per cent of the declared indium-111 radioactivity at the date and hour stated on the label. The radioactivity due to indium-114m is not greater than 0.2 per cent of the total radioactivity at the date and hour of administration. Not less than 95 per cent of the radioactivity corresponds to indium-111 complexed with pentetate.

CHARACTERS

A clear, colourless solution.

Indium-111 has a half-life of 2.8 days and emits gamma radiation and X-rays.

IDENTIFICATION

- Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised indium-111 solution apart from any differences due to the presence of indium-114m, when measured either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised indium-111 and indium-114m solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons of indium-111 have energies of 0.171 MeV and 0.245 MeV.
- Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the injection is 7.0 to 8.0.

Cadmium. Not more than 5 µg of Cd per millilitre, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Mix 0.1 ml of the injection to be examined with 0.9 ml of a mixture of 1 volume of *hydrochloric acid R* and 99 volumes of *water R*.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R* and diluting with a mixture of 1 volume of *hydrochloric acid R* and 99 volumes of *water R*.

Measure the absorbance at 228.8 nm using a cadmium hollow-cathode lamp as source of radiation and an air-acetylene flame.

Uncomplexed diethylenetriaminepenta-acetic acid.

In a micro test-tube, mix 100 µl of the injection to be examined with 100 µl of a freshly prepared 1 g/l solution of *hydroxynaphthol blue, sodium salt R* in 1 M *sodium hydroxide*. Add 50 µl of a 0.15 g/l solution of *calcium chloride R*. The solution remains pinkish-violet or changes from blue to pinkish-violet (0.4 mg/ml).

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 14/V IU/ml, V being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised solution of indium-111 apart from any differences due to the presence of indium-114m.

Indium-114m. Retain a sample of the injection to be examined for a sufficient time to allow the indium-111 radioactivity to decay to a sufficiently low level to permit the detection of radionuclidic impurities. Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated with the aid of a standardised indium-114m solution. Indium-114m has a half-life of 49.5 days and its most prominent gamma photon has an energy of 0.190 MeV. The radioactivity due to indium-114m is not greater than 0.2 per cent of the total radioactivity at the date and hour of administration.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection to be examined and allow to dry. Develop over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R*. Allow the plate to dry in air. Determine the distribution of radioactivity using a suitable detector. Indium pentetate complex migrates near to the solvent front. The radioactivity of the spot corresponding to indium pentetate complex represents not less than 95 per cent of the total radioactivity of the chromatogram.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised indium-111 solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:1113
corrected**IOBENGUANE (^{123}I) INJECTION****Iobenguani (^{123}I) solutio iniectionis****DEFINITION**

Iobenguane (^{123}I) injection is a sterile, bacterial-endotoxin free solution of 1-(3- ^{123}I iodobenzyl)guanidine or its salts. It may contain a suitable buffer, a suitable labelling catalyst such as ionic copper, a suitable labelling stabiliser such as ascorbic acid and antimicrobial preservatives. Iodine-123 is a radioactive isotope of iodine and may be obtained by proton irradiation of xenon enriched in xenon-124 (not less than 98 per cent) followed by the decay of caesium-123 formed via xenon-123. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-123 radioactivity at the date and hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to iodine-123 in the form of iobenguane. The specific radioactivity is not less than 10 GBq of iodine-123 per gram of iobenguane base. Not more than 0.35 per cent of the total radioactivity is due to radionuclides other than iodine-123.

CHARACTERS

A clear, colourless or slightly yellow solution.

Iodine-123 has a half-life of 13.2 h and emits gamma radiation and X-rays.

IDENTIFICATION

- A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-123 solution apart from any differences attributable to the presence of iodine-125, tellurium-121 and other radionuclidic impurities. The most prominent gamma photon of iodine-123 has an energy of 0.159 MeV. Iodine-125 has a half-life of 59.4 days and emits an X-ray of 0.027 MeV and a photon of 0.035 MeV. Tellurium-121 has a half-life of 19.2 days and the most prominent photons have energies of 0.507 MeV and 0.573 MeV. Standardised iodine-123, iodine-125 and tellurium-121 solutions are available from laboratories recognised by the competent authority.
- B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the solution is 3.5 to 8.0.

Specific radioactivity. The specific radioactivity is calculated from the results obtained in the test for radiochemical purity. Determine the content of iobenguane sulphate from the areas of the peaks corresponding to iobenguane in the

chromatograms obtained with the test solution and reference solution (b). Calculate the concentration as iobenguane base by multiplying the result obtained in the assay by 0.85.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175/ V IU/ml, V being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. Determine the relative amounts of iodine-125, tellurium-121 and other radionuclidic impurities present. No radionuclides with longer half-lives than iodine-125 are detected. For the determination of iodine-125, tellurium-121 and other radionuclidic impurities, retain the solution to be examined for a sufficient time to allow the radioactivity of iodine-123 to decrease to a level which permits the detection of radionuclidic impurities. Record the gamma-ray spectrum and the X-ray spectrum of the decayed material using a suitable instrument. Not more than 0.35 per cent of the total radioactivity is due to radionuclides other than iodine-123. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (2.2.29).

Test solution. The injection to be examined.

Reference solution (a). Dissolve 0.100 g of *sodium iodide R* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b). Dissolve 20.0 mg of *iobenguane sulphate CRS* in 50 ml of the mobile phase and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *silica gel for chromatography R* (5 μm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 1 volume of an 80 g/l solution of *ammonium nitrate R*, 2 volumes of *dilute ammonia R2* and 27 volumes of *methanol R*,
- a suitable radioactivity detector,
- a spectrophotometer set at 254 nm and provided with a flow-cell,
- a 10 μl loop injector.

Inject the test solution and the reference solutions. Not less than 95 per cent of the radioactivity of the chromatogram is found in the peak corresponding to iobenguane. Not more than 4 per cent of the radioactivity is found in the peak corresponding to iodide and not more than 1 per cent of the radioactivity is found in other peaks.

RADIOACTIVITY

Measure the radioactivity using a suitable counting apparatus by comparison with a standardised iodine-123 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

LABELLING

The label states the specific radioactivity expressed in GBq of iodine-123 per gram of iobenguane base.

01/2005:1111

IOBENGUANE (^{131}I) INJECTION FOR DIAGNOSTIC USE

Iobenguani (^{131}I) solutio iniectionis
ad usum diagnosticum

 $\text{C}_8\text{H}_{10}[\text{}^{131}\text{I}]\text{N}_3$

DEFINITION

Iobenguane (^{131}I) injection for diagnostic use is a sterile, bacterial endotoxin-free solution of 1-(3- $[\text{}^{131}\text{I}]$ iodobenzyl)guanidine or its salts. It may contain a suitable buffer. It may also contain a suitable labelling catalyst such as ionic copper and a suitable labelling stabiliser such as ascorbic acid. It may contain antimicrobial preservatives. Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction of uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label. Not less than 94 per cent of the radioactivity corresponds to iodine-131 in the form of iobenguane. The specific radioactivity is not less than 20 GBq of iodine-131 per gram of iobenguane base.

CHARACTERS

A clear, colourless or slightly yellow solution.

Iodine-131 has a half-life of 8.04 days and emits beta and gamma radiation.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution by direct comparison with such a solution. Standardised iodine-131 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.
- Examine the chromatogram obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the solution is 3.5 to 8.0.

Specific radioactivity. The specific radioactivity is calculated from the results obtained in the test for radiochemical purity. Determine the content of iobenguane sulphate from the areas of the peaks corresponding to iobenguane in the chromatograms obtained with the test solution and reference solution (b). Calculate the concentration as iobenguane base by multiplying the result obtained in the assay by 0.85.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175/V IU/ml, V being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution. Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present. Iodine-133 has a half-life of 20.8 h and its most prominent gamma photons have energies of 0.530 MeV and 0.875 MeV. Iodine-135 has a half-life of 6.55 h and its most prominent gamma photons have energies of 0.527 MeV, 1.132 MeV and 1.260 MeV. Not less than 99.9 per cent of the total radioactivity is due to iodine-131.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (2.2.29).

Test solution. The injection to be examined.

Reference solution (a). Dissolve 0.100 g of sodium iodide R in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b). Dissolve 20.0 mg of iobenguane sulphate CRS in 50 ml of the mobile phase and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with silica gel for chromatography R (5 μm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 1 volume of an 80 g/l solution of ammonium nitrate R, 2 volumes of dilute ammonia R2 and 27 volumes of methanol R,
- a suitable radioactivity detector,
- a spectrophotometer set at 254 nm and provided with a flow-cell,
- a 10 μl loop injector.

Inject the test solution and the reference solutions. Not less than 94 per cent of the radioactivity of the chromatogram is found in the peak corresponding to iobenguane. Not more than 5 per cent of the radioactivity is found in the peak corresponding to iodide and not more than 1 per cent of the radioactivity is found in other peaks.

RADIOACTIVITY

Measure the radioactivity using a suitable counting apparatus by comparison with a standardised iodine-131 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

LABELLING

The label states the specific radioactivity expressed in gigabecquerels of iodine-131 per gram of iobenguane base.

01/2005:1112 RADIONUCLIDIC PURITY

IOBENGUANE (¹³¹I) INJECTION FOR THERAPEUTIC USEIobenguani (¹³¹I) solutio iniectionis ad usum therapeuticumC₈H₁₀ [¹³¹I] N₃**DEFINITION**

Iobenguane (¹³¹I) injection for therapeutic use is a sterile, bacterial endotoxin-free solution of 1-(3-[¹³¹I]iodobenzyl)guanidine or its salts. It may contain a suitable buffer, a suitable labelling catalyst such as ionic copper, a suitable labelling stabiliser such as ascorbic acid and antimicrobial preservatives. Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction of uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label. Not less than 92 per cent of the radioactivity corresponds to iodine-131 in the form of iobenguane. The specific radioactivity is not less than 400 GBq of iodine-131 per gram of iobenguane base.

CHARACTERS

A clear, colourless or slightly yellow solution.

Iodine-131 has a half-life of 8.04 days and emits beta and gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution by direct comparison with such a solution. Standardised iodine-131 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.
- B. Examine the chromatogram obtained in the test for radio-chemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the solution is 3.5 to 8.0.

Specific radioactivity. The specific radioactivity is calculated from the results obtained in the test for radiochemical purity. Determine the content of iobenguane sulphate from the areas of the peaks corresponding to iobenguane in the chromatograms obtained with the test solution and reference solution (b). Calculate the concentration as iobenguane base by multiplying the result obtained in the assay by 0.85.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175/V IU/ml, V being the maximum recommended dose in millilitres.

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution. Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present. Iodine-133 has a half-life of 20.8 h and its most prominent gamma photons have energies of 0.530 MeV and 0.875 MeV. Iodine-135 has a half-life of 6.55 h and its most prominent gamma photons have energies of 0.527 MeV, 1.132 MeV and 1.260 MeV. Not less than 99.9 per cent of the total radioactivity is due to iodine-131.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (2.2.29).

Test solution. The injection to be examined.

Reference solution (a). Dissolve 0.100 g of *sodium iodide R* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b). Dissolve 20.0 mg of *iobenguane sulphate CRS* in 50 ml of the mobile phase and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *silica gel for chromatography R* (5 µm),

01/2005:1533

KRYPTON (^{81m}Kr) INHALATION GASKryptonum (^{81m}Kr) ad inhalationem**DEFINITION**

Krypton (^{81m}Kr) inhalation gas is a mixture of krypton-81m and a suitable vehicle such as air.

Krypton-81m is formed by decay of its parent radionuclide rubidium-81. Rubidium-81 has a half-life of 4.58 h.

The krypton-81m formed is separated from the rubidium-81 with a flow of a suitable gas in a rubidium/krypton generator. Rubidium-81 is produced by proton irradiation of

krypton isotopes or by helium-3 or helium-4 irradiation of bromine. After separation of rubidium-81 from the target, it is retained by a suitable support.

Krypton-81m is eluted at a suitable flow rate with a vehicle such as air. The level of moisture required in the eluent depends on the type of generator used. The transport tube for administration has a defined length and inner diameter. The radioactivity concentration is determined before administration.

The radioactivity due to radionuclides other than krypton-81m is not greater than 0.1 per cent, expressed as a percentage of the total radioactivity in the preparation and calculated with reference to the date and time of administration.

CHARACTERS

A clear, colourless gas.

Krypton-81m has a half-life of 13.1 s and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The gamma photon of krypton-81m has an energy of 0.190 MeV.
- B. The half-life is 11.8 s to 14.4 s.

TESTS

RADIONUCLIDIC PURITY

Elute the generator as prescribed. Pass a sufficient amount (2 litres to 10 litres) of eluate at a suitable flow rate through a suitable absorber such as water. Determine the amount of radioactivity eluted. Allow the krypton-81m to decay for 5 min and record the gamma and X-ray spectrum of the residual radioactivity on the absorber using a suitable instrument. Examine the gamma-ray and X-ray spectrum of the absorber for the presence of radioactive impurities, which must be identified and quantified. The absorbed radioactivity is not more than 0.1 per cent of the radioactivity passed through the absorber, calculated with reference to the date and time of administration.

RADIOACTIVITY

Determine the radioactive concentration of the preparation using suitable equipment such as an ionisation chamber or a gamma ray spectrometer. The measurement equipment may be calibrated by reference to a primary calibrated instrument at a laboratory recognised by the competent authority. The radioactivity is measured under defined operating conditions, such as gas flow rate and measurement geometry, that are identical to those used for the calibration of the instrument.

STORAGE

The storage conditions apply to the generator.

LABELLING

The labelling conditions apply to the generator.

L-METHIONINE ([¹¹C]METHYL) INJECTION

L-Methionini ([¹¹C]methyl)
solutio iniectionis

DEFINITION

Sterile solution of (2S)-2-amino-4-([¹¹C]methylsulphanyl)butanoic acid for diagnostic use.

Content: 90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

Purity:

- minimum of 99 per cent of the total radioactivity corresponds to carbon-11,
- minimum of 95 per cent of the total radioactivity corresponds to carbon-11 in the form of L-[methyl-¹¹C]methionine and D-[methyl-¹¹C]methionine,
- maximum of 10 per cent of the total radioactivity corresponds to carbon-11 in the form of D-[methyl-¹¹C]methionine.

Content of methionine: maximum of 2 mg per maximum recommended dose in millilitres.

PRODUCTION

RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon which is most commonly produced by proton irradiation of nitrogen. Depending on the addition of either trace amounts of oxygen or small amounts of hydrogen, the radioactivity is obtained as [¹¹C]carbon dioxide or [¹¹C]methane.

RADIOCHEMICAL SYNTHESIS

L-[Methyl-¹¹C]methionine can be prepared by various chemical synthetic pathways. All methods rely on the alkylation of the sulphide anion of L-homocysteine with [¹¹C]methyl iodide or [¹¹C]methyl triflate. Variations in the procedures used to generate the sulphide anion of L-homocysteine and methods to obtain [¹¹C]methyl iodide lead to negligible differences with respect to quality in terms of specific radioactivity, enantiomeric purity and possible chemical and radiochemical impurities.

Synthesis of [¹¹C]methyl iodide

[¹¹C]Methyl iodide can be obtained either starting from [¹¹C]carbon dioxide or from [¹¹C]methane. The most frequently used method is the reduction of [¹¹C]carbon dioxide with lithium aluminium hydride. The formed [¹¹C]methanol is reacted with hydroiodic acid. Alternatively [¹¹C]methane, either obtained directly in the target or by on-line processes from [¹¹C]carbon dioxide, is reacted with iodine.

Synthesis of [¹¹C]methyl triflate

[¹¹C]methyl triflate can be prepared from [¹¹C]methyl iodide using a silver triflate-impregnated solid support such as graphitised carbon.

Synthesis of L-[methyl-¹¹C]methionine

The most widely used method to obtain L-[methyl-¹¹C]methionine is the alkylation of the sulphide anion, generated from L-homocysteine thiolactone, with

[¹¹C]methyl iodide or [¹¹C]methyl triflate in alkaline conditions in a solvent such as acetone. The L-[methyl-¹¹C]methionine obtained can be purified by semi-preparative liquid chromatography. For example, a column packed with octadecylsilyl silica gel for chromatography eluted with a 9 g/l solution of sodium chloride is suitable.

L-Homocysteine thiolactone hydrochloride

Specific optical rotation (2.2.7): + 20.5 to + 21.5, determined on a 10 g/l solution at 25 °C.

Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of L-homocysteine thiolactone hydrochloride.

CHARACTERS

Appearance: clear, colourless solution.

Half-life and nature of radiation of carbon-11: see Table of physical characteristics of radionuclides (5.7).

IDENTIFICATION

A. Gamma-ray spectrometry.

Results: the only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with the test for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results: the principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (b).

TESTS

pH (2.2.3): 4.5 to 8.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175/V IU/ml, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

CHEMICAL PURITY

Impurity A, impurity B and methionine. Liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

Reference solution (a). Dissolve 0.6 mg of L-homocysteine thiolactone hydrochloride R, 2 mg of DL-homocysteine R and 2 mg of DL-methionine R in water R and dilute to V, V being the maximum recommended dose in millilitres.

Reference solution (b). Dissolve 2 mg of L-methionine R in the same solvent as used in the test solution and dilute to 10 ml with the same solvent.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: spherical octadecylsilyl silica gel for chromatography R (5 μ m) with a specific surface of 220 m²/g, a pore size of 8 nm and a carbon loading of 6.2 per cent,
- temperature: 25 °C.

Mobile phase: 1.4 g/l solution of potassium dihydrogen phosphate R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 225 nm and radioactivity detector connected in series.

Injection: loop injector.

Run time: 10 min.

Relative retention with reference to methionine (retention time = about 2.6 min): impurity B = about 0.8, impurity A = about 2.7.

System suitability: reference solution (a):

- resolution: minimum of 2.5 between the peaks due to methionine and impurity B.

Limits: examine the chromatogram obtained with the spectrophotometer:

- impurity A: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.6 mg/V),
- impurity B: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2 mg/V),
- methionine: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2 mg/V).

Residual solvents (2.4.24): maximum 50 mg/V for the concentration of acetone, V being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Carbon-11: minimum 99 per cent of the total radioactivity.

A. Gamma-ray spectroscopy.

Comparison: standardised fluorine-18 solution, or by using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

Results: the spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 19.9 min to 20.9 min.

The preparation may be released for use before completion of the test.

RADIOCHEMICAL PURITY

L-[Methyl-¹¹C]methionine and impurity E. Liquid chromatography (2.2.29) as described in the test for impurity A, impurity B and methionine.

Injection: test solution and reference solution (b).

Limits: examine the chromatogram obtained with the radioactivity detector:

- total of L-[methyl-¹¹C]methionine and impurity E: minimum of 95 per cent of the total radioactivity,
- other peaks in the chromatogram may be due to impurity C, impurity D and impurity F.

ENANTIOMERIC PURITY

Impurity E. Thin-layer chromatography (2.2.27).

Test solution. The preparation to be examined.

Reference solution (a). Dissolve 2 mg of L-methionine R in water R and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 4 mg of DL-methionine R in water R and dilute to 10 ml with the same solvent.

Plate: TLC octadecylsilyl silica gel plate for chiral separations R.

Mobile phase: methanol R, water R (50:50 V/V).

Application: 2–10 μ l.

Development: over a path of 8 cm.

Drying: in air for 5 min.

Detection: spray with a 2 g/l solution of *ninhydrin R* in *ethanol R* and heat at 60 °C for 10 min. Determine the distribution of radioactivity using a suitable detector.

Retention factors: L-[methyl- ^{11}C]methionine = about 0.58; impurity E = about 0.51.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Limits:

- total of L-[methyl- ^{11}C]methionine and impurity E: minimum 95 per cent of the total radioactivity,
- impurity E: maximum 10 per cent of the total radioactivity.

The preparation may be released for use before completion of the test.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The accompanying information specifies the maximum recommended dose in millilitres.

IMPURITIES

- A. (3*S*)-3-aminodihydrothiophen-2(3*H*)-one (L-homocysteine thiolactone),

- B. (2*S*)-2-amino-4-sulphanylbutanoic acid (L-homocysteine),

- C. (2*RS*)-2-amino-4-([^{11}C]methylsulphonyl)butanoic acid (DL-[methyl- ^{11}C]methionine *S,S*-dioxide),

- D. (2*RS*)-2-amino-4-([^{11}C]methylsulphonyl)butanoic acid (DL-[methyl- ^{11}C]methionine *S*-oxide),

- E. (2*R*)-2-amino-4-([^{11}C]methylsulphanyl)butanoic acid (D-[methyl- ^{11}C]methionine),

- F. [^{11}C]methanol

NORCHOLESTEROL INJECTION, IODINATED (^{131}I)

Norcholesteroli iodinati (^{131}I)
solutio iniectionis

DEFINITION

Iodinated (^{131}I) norcholesterol injection is a sterile, bacterial endotoxin-free solution of 6β-[^{131}I]iodomethyl-19-norcholest-5(10)-en-3β-ol. It may contain a suitable emulsifier such as polysorbate 80 and a suitable antimicrobial preservative such as benzyl alcohol. Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction from uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label. Not less than 85 per cent of the radioactivity corresponds to iodine-131 in the form of 6β-[^{131}I]iodomethyl-19-norcholest-5(10)-en-3β-ol. Not more than 5 per cent of the radioactivity corresponds to iodine-131 in the form of iodide. The specific radioactivity is 3.7 GBq to 37 GBq per gram of 6β-iodomethylnorcholesterol.

CHARACTERS

A clear or slightly turbid, colourless or pale yellow solution. Iodine-131 has a half-life of 8.04 days and emits beta and gamma radiation.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution by direct comparison with such a solution. The most prominent photon of iodine-131 has an energy of 0.365 MeV. Standardised iodine-131 solutions are available from laboratories recognised by the competent authority.
- Examine the chromatogram obtained in test (a) for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the solution is between 3.5 and 8.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175/*V* IU/ml, *V* being the maximum recommended dose in millilitres.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution. Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other

radionuclidic impurities present. Iodine-133 has a half-life of 20.8 h and its most prominent gamma photons have energies of 0.530 MeV and 0.875 MeV. Iodine-135 has a half-life of 6.55 h and its most prominent gamma photons have energies of 0.527 MeV, 1.132 MeV and 1.260 MeV. Not less than 99.9 per cent of the total radioactivity is due to iodine-131.

RADIOCHEMICAL PURITY

a) Examine by thin-layer chromatography (2.2.27) using silica gel GF₂₅₄ R as the coating substance.

Test solution. The injection to be examined.

Carrier solution. Dissolve 10 mg of potassium iodide R, 20 mg of potassium iodate R and 0.1 g of sodium hydrogen carbonate R in distilled water R and dilute to 10 ml with the same solvent.

Apply to the plate up to 5 µl of the test solution and 10 µl of the carrier solution on the same spot. Develop over a path of 15 cm (about 60 min) using chloroform R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Determine the distribution of radioactivity using a suitable detector. In the chromatogram obtained, not less than 85 per cent of the total radioactivity is found in the spot corresponding to 6β-iodomethyl-19-norcholest-5(10)-en-3β-ol at an *R_f* value of about 0.5. Iodide ion remains near the starting-line.

b) Examine by thin-layer chromatography (2.2.27) using silica gel GF₂₅₄ R as the coating substance.

Test solution. The injection to be examined.

Carrier solution. Dissolve 10 mg potassium iodide R, 20 mg of potassium iodate R and 0.1 g of sodium hydrogen carbonate R in distilled water R and dilute to 10 ml with the same solvent.

Apply to the plate 10 µl of the carrier solution and then up to 5 µl of the test solution on the same spot. Develop over a path of 15 cm (about 90 min) using a mixture of equal volumes of chloroform R and ethanol R. Allow the plate to dry in air. Expose the plate to ultraviolet light at 254 nm for 5 min. A yellow spot corresponding to iodide develops at an *R_f* value of about 0.5. Determine the distribution of radioactivity using a suitable detector. The main peak of radioactivity is near to the solvent front. Other iodocholesterols migrate near the solvent front. In the chromatogram obtained, not more than 5 per cent of the total radioactivity is found in the spot corresponding to iodide.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised iodine-131 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light at a temperature not exceeding – 18 °C.

01/2005:1620

OXYGEN (¹⁵O)

Oxygenium (¹⁵O)

DEFINITION

Mixture of [¹⁵O]oxygen in the gaseous phase and a suitable vehicle such as Medicinal air (1238), for diagnostic use.

Purity:

- minimum 99 per cent of the total radioactivity corresponds to oxygen-15,

- minimum 97 per cent of the total radioactivity corresponds to oxygen-15 in the form of oxygen (O₂).

PRODUCTION

RADIONUCLIDIC PRODUCTION

Oxygen-15 is a radioactive isotope of oxygen which may be produced by various nuclear reactions such as proton irradiation of nitrogen-15 or deuteron irradiation of nitrogen-14.

RADIOCHEMICAL SYNTHESIS

In order to recover oxygen-15 as molecular oxygen from the nitrogen target gas, carrier oxygen is added at concentrations generally ranging from 0.2 per cent V/V to 1.0 per cent V/V. After irradiation, the target gas is usually passed through activated charcoal and a carbon dioxide scavenger, such as soda lime, before mixing with the vehicle.

CHARACTERS

Appearance: colourless gas.

Half-life and nature of radiation of oxygen-15: see Table of physical characteristics of radionuclides (5.7).

IDENTIFICATION

A. Gamma spectrometry.

Results: the only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with the test for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results: the retention times of the principal peaks in the chromatogram obtained with the test gas using the radioactivity detector are similar to those of the principal peaks corresponding to oxygen in the chromatogram obtained with the reference gas using the thermal conductivity detector.

TESTS

The following tests are performed on [¹⁵O]oxygen as described under radiochemical synthesis before mixing with the vehicle.

RADIONUCLIDIC PURITY

Oxygen-15: minimum 99 per cent of the total radioactivity.

A. Gamma spectrometry.

Comparison: standardised fluorine-18 solution, or by using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

Results: the spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 1.9 min to 2.2 min.

The preparation may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Oxygen-15 in the form of O₂. Gas chromatography (2.2.28): use the normalisation procedure.

Test sample. [¹⁵O]oxygen as described under radiochemical synthesis.

Reference gas. Nitrogen gas mixture R.

Column:

- size: l = 1.8 m, Ø1 = 6.3 mm and Ø2 = 3.2 mm,

– *stationary phase*: GC concentric column R.

Carrier gas: helium for chromatography R.

Flow rate: 65 ml/min.

Temperature:

– *column*: 40 °C,

– *injection port*: 40 °C,

– *thermal conductivity detector*: 70 °C.

Detection: thermal conductivity detector and radioactivity detector connected in series.

Injection: loop injector.

Run time: 10 min.

Retention times: oxygen, nitrogen and carbon monoxide eluting from the inner column = about 0.4 min; carbon dioxide eluting from the inner column = about 0.8 min; oxygen eluting from the outer column = about 2.1 min; nitrogen eluting from the outer column = about 3.1 min; carbon monoxide eluting from the outer column = about 6.2 min.

System suitability: reference gas:

- 5 clearly separated principal peaks are observed in the chromatogram obtained using the thermal conductivity detector,
- *resolution*: minimum of 1.5 between the peaks due to carbon dioxide eluting from the inner column and oxygen eluting from the outer column, in the chromatogram obtained using the thermal conductivity detector.

Limits: examine the chromatogram obtained with the radioactivity detector and calculate the percentage content of oxygen-15 substances from the peak areas.

- *oxygen-15 gas in the form of O₂*: minimum 97 per cent of the total radioactivity,
- disregard the first peak corresponding to components co-eluting from the inner column.

RADIOACTIVITY

The radioactive concentration is determined before administration.

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:1924

RACLOPRIDE ([¹¹C]METHOXY) INJECTION

Raclopridi ([¹¹C]methoxy)
solutio iniectionis

DEFINITION

Sterile solution of 3,5-dichloro-N-[(2S)-1-ethylpyrrolidin-2-yl]methyl]-2-hydroxy-6-([¹¹C]methoxy)benzamide.

Content: 90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

Purity:

- minimum of 99 per cent of the total radioactivity corresponds to carbon-11,
- minimum of 95 per cent of the total radioactivity corresponds to carbon-11 in the form of [¹¹C]methoxy-raclopride.

Content of raclopride: maximum of 10 µg per maximum recommended dose in millilitres.

PRODUCTION

RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon most commonly produced by proton irradiation of nitrogen. Depending on the addition of either trace amounts of oxygen or small amounts of hydrogen, the radioactivity is obtained as [¹¹C]carbon dioxide or [¹¹C]methane, respectively.

RADIOCHEMICAL SYNTHESIS

[¹¹C]methoxy-raclopride may be prepared by O-alkylation of the corresponding phenolate anion (S)-3,5-dichloro-2,6-dihydroxy-N-[(1-ethylpyrrolidin-2-yl)methyl]benzamide with iodo[¹¹C]methane or [¹¹C]methyl trifluoromethanesulphonate.

Synthesis of iodo[¹¹C]methane

Iodo[¹¹C]methane may be produced from [¹¹C]carbon dioxide or from [¹¹C]methane. The most frequently used method is reduction of [¹¹C]carbon dioxide with lithium aluminium hydride. The lithium aluminium [¹¹C]methanolate formed is reacted with hydroiodic acid to iodo[¹¹C]methane via [¹¹C]methanol. Alternatively [¹¹C]methane, either obtained directly in the target or by on-line processes from [¹¹C]carbon dioxide, is reacted with iodine.

Synthesis of [¹¹C]methyl trifluoromethanesulphonate

[¹¹C]Methyl trifluoromethanesulphonate may be prepared from iodo[¹¹C]methane using a solid support such as graphitised carbon impregnated with silver trifluoromethanesulphonate.

Synthesis of [¹¹C]methoxy-raclopride

Methylation with iodo[¹¹C]methane is performed under alkaline conditions in a solvent such as dimethyl sulphoxide. The methylation with [¹¹C]methyl trifluoromethanesulphonate is performed in a solvent such as dimethylformamide or acetone. The resulting [¹¹C]methoxy-raclopride may be purified by semi-preparative liquid chromatography using, for example, a column packed with octadecylsilyl silica gel for chromatography eluted with a mixture of 25 volumes of acetonitrile and 75 volumes of 0.01 M phosphoric acid.

PRECURSOR FOR SYNTHESIS

(S)-3,5-Dichloro-2,6-dihydroxy-N-[(1-ethylpyrrolidin-2-yl)methyl]benzamide hydrobromide

Melting point (2.2.14): 211 °C to 213 °C.

Specific optical rotation (2.2.7): + 11.3 to + 11.5, determined on a 15.0 g/l solution in *ethanol R* at 22 °C.

CHARACTERS

Appearance: clear, colourless solution.

Half-life and nature of radiation of carbon-11: see Table of physical characteristics of radionuclides (5.7).

IDENTIFICATION

A. Gamma-ray spectrometry.

Results: the only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

- C. Examine the chromatograms obtained in the test for radiochemical purity.

Results: the principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (d).

TESTS

pH (2.2.3): 4.5 to 8.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175/V IU/ml, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

CHEMICAL PURITY

Raclopride and impurity A. Liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

Reference solution (a). Dissolve 7.2 mg of *raclopride tartrate R* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dissolve 1.2 mg of (*S*)-3,5-dichloro-2,6-dihydroxy-*N*-[(1-ethylpyrrolidin-2-yl)methyl]benzamide hydrobromide *R* in *methanol R* and dilute to 100 ml with the same solvent.

Reference solution (c). To 0.1 ml of reference solution (a) add 0.1 ml of reference solution (b) and dilute to V with *water R*, V being the maximum recommended dose in millilitres.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *water R*.

Column:

- **size:** *l* = 0.05 m, Ø = 4.6 mm,
- **stationary phase:** spherical *end-capped octadecylsilyl silica gel for chromatography R* (3.5 µm) with a specific surface area of 175 m²/g, a pore size of 12.5 nm, a pore volume of 0.7 cm³/g and a carbon loading of 15 per cent,
- **temperature:** 30 °C.

Mobile phase: dissolve 2 g of *sodium heptanesulphonate R* in 700 ml of *water R*, adjust to pH 3.9 with *phosphoric acid R* and dilute to 1000 ml with *acetonitrile R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm and radioactivity detector connected in series.

Injection: loop injector; inject the test solution and reference solutions (b) and (c).

Run time: 10 min.

Relative retention with reference to raclopride: impurity A = about 0.46.

System suitability: reference solution (c):

- **resolution:** minimum of 5 between the peaks due to raclopride and to impurity A.

Limits: examine the chromatogram obtained with the spectrophotometer:

- **raclopride:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (10 µg/V),
- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1 µg/V).

Residual solvents are limited according to the principles defined in the general chapter (5.4), using the general method (2.4.24). The preparation may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Carbon-11: minimum 99 per cent of the total radioactivity.

The preparation may be released for use before completion of the test.

A. Gamma-ray spectrometry.

Comparison: standardised fluorine-18 solution, or by using a calibrated instrument. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

Results: the spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life. 19.9 min to 20.9 min.

RADIOCHEMICAL PURITY

Liquid chromatography (2.2.29) as described in the test for raclopride and impurity A with the following modifications.

Injection: test solution and reference solution (d).

Limits: examine the chromatogram obtained with the radioactivity detector:

- [*Methoxy-¹¹C*] raclopride: minimum of 95 per cent of the total radioactivity.

RADIOACTIVITY

Mesure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by using a calibrated instrument.

LABELLING

The accompanying information specifies the maximum recommended dose in millilitres.

IMPURITIES

- A. 3,5-dichloro-*N*-[(2*S*)-1-ethylpyrrolidin-2-yl]methyl]-2,6-dihydroxybenzamide.

01/2005:1920

SODIUM ACETATE ([1-¹¹C]) INJECTION

Natrii acetatis ([1-¹¹C]) solutio iniectabilis

DEFINITION

Sterile solution of sodium [1-¹¹C]acetate, in equilibrium with [1-¹¹C]acetic acid.

Content: 90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

PRODUCTION

RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon which is most commonly produced by proton irradiation of nitrogen. By the addition of trace amounts of oxygen, the radioactivity is obtained as [^{11}C]carbon dioxide.

RADIOCHEMICAL SYNTHESIS

[^{11}C]Carbon dioxide may be separated from the target gas mixture by cryogenic trapping or by trapping on a molecular sieve at room temperature. [^{11}C]Carbon dioxide is then released from the trap using an inert gas such as nitrogen at a temperature higher than the trapping temperature.

[1- ^{11}C]Acetate is usually prepared by reaction of [^{11}C]carbon dioxide with methylmagnesium bromide in organic solvents such as ether or tetrahydrofuran.

Hydrolysis of the product yields [1- ^{11}C]acetic acid. It is purified by chromatographic procedures. The eluate is diluted with sodium chloride solution.

PRECURSOR FOR SYNTHESIS

Methylmagnesium bromide. The reactivity of methylmagnesium bromide is tested by decomposition of a defined amount with water. The amount of hydrogen released during this reaction is not less than 90 per cent of the theoretical value.

CHARACTERS

Appearance: clear, colourless solution.

Half-life and nature of radiation of carbon-11: see Table of physical characteristics of radionuclides (5.7).

IDENTIFICATION

A. Gamma-ray spectrometry.

Results: the only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

Results: the principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3): 4.5 to 8.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175/V IU/ml, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

CHEMICAL PURITY

Acetate. Liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

Reference solution. Dissolve 28 mg of sodium acetate R in water R and dilute to V, V being the maximum recommended dose in millilitres.

Column:

- size: $l = 0.25\text{ m}$, $\varnothing = 4.0\text{ mm}$,
- stationary phase: strongly basic anion exchange resin for chromatography R (10 μm),
- temperature: 25 °C.

Mobile phase: 0.1 M sodium hydroxide protected from atmospheric carbon dioxide.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm and radioactivity detector connected in series.

Injection: loop injector.

Run time: 10 min.

System suitability: reference solution:

- resolution: minimum 4.0 between the peaks due to hold-up volume and acetate.

Limit: examine the chromatograms obtained with the spectrophotometer:

- acetate: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (20 mg per V).

Residual solvents are limited according to the principles defined in the general chapter (5.4), using the general method (2.4.24). The preparation may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Carbon-11: minimum 99 per cent of the total radioactivity.

The preparation may be released for use before completion of the tests.

A. Gamma-ray spectrometry.

Comparison: standardised fluorine-18 solution, or by using a calibrated instrument. Standardised fluorine-18 solutions and/or standardisation services are available from laboratories recognised by the competent authority.

Results: the spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 19.9 min to 20.9 min.

RADIOCHEMICAL PURITY

[1- ^{11}C]Acetate. Liquid chromatography (2.2.29) as described in the test for acetate.

Limit: examine the chromatograms obtained with the spectrophotometer and the radioactivity detector:

- total of [1- ^{11}C]acetate: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement with a calibrated instrument.

LABELLING

The accompanying information specifies the maximum recommended dose in millilitres.

01/2005:0279

SODIUM CHROMATE (^{51}Cr) STERILE SOLUTIONNatrii chromatis (^{51}Cr) solutio sterilis

DEFINITION

Sodium chromate (^{51}Cr) sterile solution is a sterile solution of sodium [^{51}Cr]chromate made isotonic by the addition of sodium chloride. Chromium-51 is a radioactive isotope of chromium and may be prepared by neutron irradiation of chromium, either of natural isotopic composition or enriched in chromium-50. The solution contains not less than 90.0 per cent and not more than 110.0 per cent of

the declared chromium-51 radioactivity at the date and hour stated on the label. Not less than 90 per cent of the radioactivity corresponds to chromium-51 in the form of chromate. The specific radioactivity is not less than 370 MBq of chromium-51 per milligram of chromate ion.

CHARACTERS

A clear, colourless or slightly yellow solution.

Chromium-51 has a half-life of 27.7 days and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised chromium-51 solution. Standardised chromium-51 solution are available from laboratories recognised by the competent authority. The gamma photon has an energy of 0.320 MeV.
- B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the solution is 6.0 to 8.5.

Total chromate. Not more than 2.7 µg of chromate ion (CrO₄²⁻) per megabecquerel. Measure the absorbance of the solution (2.2.25) at the absorption maximum at 370 nm. Calculate the content of chromate using the absorbance of a standard consisting of a 1.7 mg/l solution of *potassium chromate R*. If necessary, adjust the solution to be examined and the standard to pH 8.0 by adding *sodium hydrogen carbonate solution R*.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The solution may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised chromium-51 solution.

RADIOCHEMICAL PURITY

Examine by ascending paper chromatography (2.2.26). Apply to the paper a quantity of the solution sufficient for the detection method. Begin the development immediately and develop for 2.5 h using a mixture of 25 volumes of *ammonia R*, 50 volumes of *alcohol R* and 125 volumes of *water R*. Chromic ions remain on the starting line. Determine the distribution of the radioactivity using a suitable detector. Not less than 90 per cent of the total radioactivity of the chromatogram is found in the spot with an *R_f* value of about 0.9, corresponding to sodium chromate.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised chromium-51 solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:2100

SODIUM FLUORIDE (¹⁸F) INJECTION

Natrii fluoridi (¹⁸F) solutio iniectabilis

DEFINITION

Sterile solution containing fluorine-18 in the form of sodium fluoride. It may contain carrier fluoride and a suitable buffer.

Content:

- *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and hour stated on the label,
- *fluoride*: maximum 4.52 mg per maximum recommended dose in millilitres.

PRODUCTION

The radionuclide fluorine-18 is most commonly produced by proton irradiation of water enriched in oxygen-18. Fluorine-18 in the form of fluoride is recovered from the target water, generally by adsorption and desorption from anion-exchange resins or electrochemical deposition and redissolution.

CHARACTERS

Appearance: clear, colourless solution.

Half-life and nature of radiation of fluorine-18: see *Table of physical characteristics of radionuclides (5.7)*.

IDENTIFICATION

- A. Gamma-ray spectrometry.

Results: the only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

- B. It complies with test B for radionuclidic purity (see Tests).
- C. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

Results: the principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution. In the chromatogram obtained with the reference solution, the peak due to fluoride is negative.

TESTS

pH (2.2.3): 5.0 to 8.5.

Fluoride. Liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

Reference solution. Dissolve 10 mg of *sodium fluoride R* in *water R* and dilute to *V* with the same solvent, *V* being the maximum recommended dose in millilitres.

Column:

- *size*: *l* = 0.25 m, Ø = 4 mm,
- *stationary phase*: *strongly basic anion-exchange resin for chromatography R* (10 µm),
- *temperature*: constant, between 20 °C and 30 °C.

Mobile phase: 4 g/l solution of *sodium hydroxide R*, protected from atmospheric carbon dioxide.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm and a radioactivity detector connected in series.

Injection: 20 µl.

Run time: 15 min.

System suitability: examine the chromatogram obtained with the reference solution using the spectrophotometer:

- *signal-to-noise ratio*: minimum 10 for the principal peak,
- *retention time of fluoride*: minimum 3 times the hold-up time.

Limit: examine the chromatogram obtained with the spectrophotometer:

- *fluoride*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (4.52 mg/*V*).

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than $175/V \text{ IU/ml}$, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Fluorine-18: minimum 99.9 per cent of the total radioactivity.

The preparation may be released for use before completion of the tests.

A. Gamma-ray spectrometry.

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for a sufficient time to allow the fluorine-18 to decay to a level which permits the detection of impurities.

Results: the spectrum obtained with the preparation to be examined does not differ significantly from that of a background spectrum.

B. Half-life: 105 min to 115 min.

RADIOCHEMICAL PURITY

[^{18}F]fluoride. Liquid chromatography (2.2.29) as described in the test for fluoride. If necessary, dilute the test solution with *water R* to obtain a radioactivity concentration suitable for the radioactivity detector.

Limit: examine the chromatogram obtained with the radioactivity detector:

- [^{18}F]fluoride: minimum 98.5 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states the maximum recommended dose in millilitres.

01/2005:0563

SODIUM IODIDE (^{123}I) INJECTION

Natrii iodidi (^{123}I) solutio iniectabilis

DEFINITION

Sterile solution containing iodine-123 in the form of sodium iodide; it may contain sodium thiosulphate or some other suitable reducing agent and a suitable buffer.

Content: 90 per cent to 110 per cent of the declared iodine-123 radioactivity at the date and hour stated on the label.

PRODUCTION

Iodine-123 is obtained by proton irradiation of xenon enriched in xenon-124 (minimum 98 per cent) followed by the decay of xenon-123 which is formed directly and by the decay of caesium-123. No carrier iodide is added.

CHARACTERS

Appearance: clear, colourless solution.

Half-life and nature of radiation of iodine-123: see *Table of physical characteristics of radionuclides (5.7)*.

IDENTIFICATION

A. Gamma-ray spectrometry.

Results: the spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-123 solution. The most prominent gamma photon has an energy of 0.159 MeV and is accompanied by the principal X-ray of 0.027 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity.

Results: the principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

pH (2.2.3): 7.0 to 10.0.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Iodine-123: minimum 99.65 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-123, iodine-125, tellurium-121 and other radionuclidic impurities present. For the detection of tellurium-121 and iodine-125, retain the preparation to be examined for a sufficient time to allow iodine-123 to decay to a level which permits the detection of radionuclidic impurities. No radionuclides with a half-life longer than that of iodine-125 are detected.

The preparation may be released for use before completion of the test.

RADIOCHEMICAL PURITY

[^{123}I]iodide. Liquid chromatography (2.2.29).

Test solution. Dilute the preparation to be examined with a 2 g/l solution of *sodium hydroxide R* to a radioactive concentration suitable for the detector. Add an equal volume of a solution containing 1 g/l of *potassium iodide R*, 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R* and mix.

Reference solution (a). Dilute 1 ml of a 26.2 mg/l solution of *potassium iodide R* to 10 ml with *water R*.

Reference solution (b). Dilute 1 ml of a 24.5 mg/l solution of *potassium iodate R* to 10 ml with *water R*. Mix equal volumes of this solution and reference solution (a).

Column:

- **size:** $l = 0.25 \text{ m}$, $\varnothing = 4.0 \text{ mm}$,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μm),
- **temperature:** constant between 20 °C and 30 °C.

Mobile phase: dissolve 5.85 g of *sodium chloride R* in 1000 ml of *water R*, add 0.65 ml of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R*; add 50 ml of *acetonitrile R* and mix.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm and a radioactivity detector connected in series.

Injection: 20 μl .

Run time: 12 min.

Relative retention with reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability: reference solution (b):

- **resolution:** minimum 2 between the peaks due to iodide and iodate in the chromatogram recorded with the spectrophotometer.

Limit: examine the chromatogram obtained with the test solution using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer:

- [^{123}I]iodide: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states any substance added.

IMPURITIES

A. [^{123}I]iodate ion.

01/2005:0938

SODIUM IODIDE (^{131}I) CAPSULES FOR DIAGNOSTIC USE

Natrii iodidi (^{131}I) capsulae ad usum diagnosticum

DEFINITION

Capsules for diagnostic use containing iodine-131 in the form of sodium iodide on a solid support; they may contain sodium thiosulphate or some other suitable reducing agents and a suitable buffering substance. A package contains 1 or more capsules.

Content:

- iodine-131: maximum 37 MBq per capsule; the average radioactivity determined in the test for uniformity of content is 90 per cent to 110 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label;
- iodide: maximum 20 µg per capsule.

PRODUCTION

Iodine-131 is obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

CHARACTERS

Half-life and nature of radiation of iodine-131: see *Table of physical characteristics of radionuclides* (5.7).

IDENTIFICATION

A. Gamma-ray spectrometry.

Results: the spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity.

Results: the principal peak in the radiochromatogram obtained with test solution (b) is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Disintegration: the contents of the capsule dissolve completely within 15 min.

In a water-bath at 37 °C, warm in a small beaker about 20 ml of a 2.0 g/l solution of *potassium iodide R*. Add a capsule to be examined. Stir magnetically at 20 r/min.

Uniformity of content. Determine the radioactivity of each of not fewer than 10 capsules. Calculate the average radioactivity per capsule. The radioactivity of no capsule differs by more than 10 per cent from the average, the relative standard deviation is not greater than 3.5 per cent.

Iodide. Liquid chromatography (2.2.29).

Test solution (a). Dissolve a capsule to be examined in 10 ml of *water R*. Filter through a 0.2 µm filter.

Test solution (b). Dissolve a capsule to be examined in *water R*. Filter through a 0.2 µm filter and dilute the filtrate with a 2 g/l solution of *sodium hydroxide R* to a radioactive concentration suitable for the detector. Add an equal volume of a solution containing 1 g/l of *potassium iodide R*, 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R* and mix.

Reference solution (a). Dilute 1 ml of a 26.2 mg/l solution of *potassium iodide R* to 10 ml with *water R*.

Reference solution (b). Dilute 1 ml of a 24.5 mg/l solution of *potassium iodate R* to 10 ml with *water R*. Mix equal volumes of this solution and reference solution (a).

Blank solution. Prepare a solution containing 2 mg/ml of each constituent stated on the label, apart from iodide.

Column:

- **size:** $l = 0.25\text{ m}$, $\varnothing = 4.0\text{ mm}$,
- **stationary phase:** *octadecylsilyl silica gel for chromatography R* (5 µm),
- **temperature:** constant between 20 °C and 30 °C.

Mobile phase: dissolve 5.85 g of *sodium chloride R* in 1000 ml of *water R*, add 0.65 ml of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R*; add 50 ml of *acetonitrile R* and mix.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm and radioactivity detector connected in series.

Injection: 20 µl of test solution (a), reference solutions (a) and (b) and the blank solution.

Run time: 12 min.

Relative retention with reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability:

- in the chromatogram obtained with the blank solution, none of the peaks has a retention time similar to that of the peak due to iodide,
- **resolution:** minimum 2 between the peaks due to iodide and iodate in the chromatogram obtained with reference solution (b) recorded with the spectrophotometer.

Limit: examine the chromatograms obtained with the spectrophotometer:

- **iodide:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (20 µg/capsule).

RADIONUCLIDIC PURITY

Iodine-131: minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

RADIOCHEMICAL PURITY

[^{131}I]iodide. Liquid chromatography (2.2.29) as described in the test for iodide with the following modifications.

Injection: 20 μl of test solution (b) and reference solution (a).

Limit: examine the chromatogram obtained with the test solution using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer:

- [^{131}I]iodide: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity of the package using a calibrated instrument.

LABELLING

The label states any substance added and the number of capsules in the package.

IMPURITIES

A. [^{131}I]iodate ion.

01/2005:0281

SODIUM IODIDE (^{131}I) SOLUTION**Natrii iodidi (^{131}I) solutio****DEFINITION**

Solution containing iodine-131 in the form of sodium iodide and also sodium thiosulphate or some other suitable reducing agent. It may contain a suitable buffer.

Content:

- *iodine-131*: 90 per cent to 110 per cent of the declared radioactivity at the date and hour stated on the label,
- *iodide*: maximum 20 μg in the maximum recommended dose in millilitres.

PRODUCTION

Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

CHARACTERS

Appearance: clear, colourless solution.

Half-life and nature of radiation of iodine-131: see Table of physical characteristics of radionuclides (5.7).

IDENTIFICATION

A. Gamma-ray spectrometry.

Results: the spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for iodide.

Results: the principal peak in the radiochromatogram obtained with test solution (a) is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

pH (2.2.3): 7.0 to 10.0.

Sterility. If intended for parenteral use, it complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The solution may be released for use before completion of the test.

Iodide. Liquid chromatography (2.2.29).

Test solution (a). The preparation to be examined.

Test solution (b). Dilute the preparation to be examined with 0.05 M sodium hydroxide until the radioactivity is equivalent to about 74 MBq/ml. Add an equal volume of a solution containing 1 g/l of *potassium iodide R*, 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R* and mix.

Reference solution (a). Dilute 1 ml of a 26.2 mg/l solution of *potassium iodide R* to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

Reference solution (b). Dilute 1 ml of a 24.5 mg/l solution of *potassium iodate R* to *V* with *water R*, *V* being the maximum recommended dose in millilitres. Mix equal volumes of this solution and of reference solution (a).

Blank solution. Prepare a solution containing 2 mg/ml of each of the components stated on the label, apart from iodide.

Column:

- **size:** $l = 0.25\text{ m}$, $\varnothing = 4.0\text{ mm}$,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μm),
- **temperature:** maintain at a constant temperature between 20 °C and 30 °C.

Use stainless steel tubing.

Mobile phase: dissolve 5.844 g of *sodium chloride R* in 1000 ml of *water R*, add 650 μl of *octylamine R* and adjust to pH 7.0 with *phosphoric acid R*; add 50 ml of *acetonitrile R* and mix.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm and radioactivity detector connected in series.

Injection: 25 μl ; inject test solution (a), the blank solution and reference solutions (a) and (b).

Run time: 12 min.

Relative retention with reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability:

- in the chromatogram obtained with the blank solution, none of the peaks shows a retention time similar to that of the peak due to iodide,
- **resolution:** minimum 2 between the peaks due to iodide and iodate in the chromatogram obtained with reference solution (b) recorded with the spectrophotometer.

Limit: examine the chromatogram obtained with the spectrophotometer; locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a):

- *iodide*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a).

RADIONUCLIDIC PURITY

Iodine-131: minimum 99.9 per cent of the total radioactivity. Gamma-ray spectrometry.

Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

RADIOCHEMICAL PURITY

[^{131}I]iodide. Liquid chromatography (2.2.29) as described in the test for iodide with the following modification.

Injection: test solution (b).

Limit: examine the chromatogram obtained with the radioactivity detector:

- [^{131}I]iodide: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised iodine-131 solution or by using a calibrated instrument.

LABELLING

The label states:

- any substance added,
- the maximum recommended dose, in millilitres,
- where applicable, that the preparation is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. [^{131}I]iodate ion.

01/2005:2121

SODIUM IODIDE (^{131}I) SOLUTION FOR RADIOLABELLING

Natrii iodidi (^{131}I) solutio ad radio-signandum

DEFINITION

Strongly alkaline solution containing iodine-131 in the form of sodium iodide. It does not contain a reducing agent.

Content: 90 per cent to 110 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label.

PRODUCTION

Iodine-131 may be obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

CHARACTERS

Appearance: clear, colourless solution.

Half-life and nature of radiation of iodine-131: see Table of physical characteristics of radionuclides (5.7).

IDENTIFICATION

A. Gamma-ray spectrometry.

Results: the spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

Results: the principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Alkalinity (2.2.4). The preparation is strongly alkaline.

RADIONUCLIDIC PURITY

Iodine-131: minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-130, iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

RADIOCHEMICAL PURITY

[^{131}I]iodide. Liquid chromatography (2.2.29).

Test solution. Dilute the preparation to be examined with an equal volume of a solution containing 1 g/l of *potassium iodide R*, 2 g/l of *potassium iodate R* and 10 g/l of *sodium hydrogen carbonate R* and mix. If necessary, first dilute the preparation to be examined with a 2 g/l solution of *sodium hydroxide R* to ensure that the final mixture has a radioactivity concentration suitable for the radioactivity detector.

Reference solution (a). Dissolve 10 mg of *potassium iodide R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *potassium iodate R* in *water R* and dilute to 10 ml with the same solvent. Mix equal volumes of this solution and reference solution (a).

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μm),
- **temperature:** constant, between 20 °C and 30 °C.

Use stainless steel tubing.

Mobile phase: dissolve 5.85 g of *sodium chloride R* in 1000 ml of *water R*, add 0.65 ml of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R*; add 50 ml of *acetonitrile R* and mix.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm and a radioactivity detector connected in series.

Injection: 20 μl .

Run time: 12 min.

Relative retention with reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

System suitability: reference solution (b):

- **resolution:** minimum 2 between the peaks due to iodide and iodate in the chromatogram recorded with the spectrophotometer.

Limit: examine the chromatogram obtained with the radioactivity detector:

- [^{131}I]iodide: minimum 95 per cent of the total radioactivity.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

LABELLING

The label states:

- the method of production of iodine-131,
- the vehicle and any substance added,
- that the preparation is not for direct human use.

IMPURITIES

A. [^{131}I]iodate ion.

01/2005:0564

SODIUM IODOHIPPURATE (^{123}I) INJECTION

Natrii iodohippurati (^{123}I) solutio iniectionis

DEFINITION

Sodium iodohippurate (^{123}I) injection is a sterile solution of sodium (2-[^{123}I]iodobenzamido)acetate. It may contain a suitable buffer and a suitable antimicrobial preservative

such as benzyl alcohol. Iodine-123 is a radioactive isotope of iodine and may be obtained by proton irradiation of xenon enriched in xenon-124 (not less than 98 per cent) followed by the decay of caesium-123 formed via xenon-123. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-123 radioactivity at the date and hour stated on the label. Not less than 96 per cent of the radioactivity corresponds to iodine-123 in the form of sodium 2-iodohippurate. The specific radioactivity is 0.74 GBq to 10.0 GBq of iodine-123 per gram of sodium 2-iodohippurate. Not more than 0.35 per cent of the total radioactivity is due to radionuclides other than iodine-123.

CHARACTERS

A clear, colourless liquid.

Iodine-123 has a half-life of 13.2 h and emits gamma radiation and X-rays.

IDENTIFICATION

- A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-123 solution apart from any differences attributable to the presence of iodine-125, tellurium-121 and other radionuclidic impurities. Standardised iodine-123, iodine-125 and tellurium-121 solutions are available from laboratories recognised by the national authorities. The most prominent gamma photon of iodine-123 has an energy of 0.159 MeV and is accompanied by an X-ray of 0.027 MeV. Iodine-125 has a half-life of 59.4 days and emits an X-ray of 0.027 MeV and a photon of 0.035 MeV. Tellurium-121 has a half-life of 19.2 days and the most prominent photons have energies of 0.507 MeV and 0.573 MeV.
- B. Examine the chromatograms obtained in the test for radiochemical purity. The spot corresponding to the main peak of radioactivity in the chromatogram obtained with the test solution is similar in position to the spot corresponding to 2-iodohippuric acid in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3). The pH of the solution is 3.5 to 8.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. Determine the relative amounts of iodine-125, tellurium-121 and other radionuclidic impurities present. No radionuclides with longer half lives than iodine-125 are detected. For the determination of iodine-125, tellurium-121 and other radionuclidic impurities, retain the solution to be examined for a sufficient time to allow the radioactivity of iodine-123 to decrease to a level which permits the detection of radionuclidic impurities. Record the gamma-ray spectrum and X-ray spectrum of the decayed material using a suitable instrument. Not more than 0.35 per cent of the total radioactivity is due to radionuclides other than iodine-123. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using *silica gel GF₂₅₄* R as the coating substance.

Test solution. Dissolve 1 g of *potassium iodide* R in 10 ml of *water* R, add 1 volume of this solution to 10 volumes of the injection to be examined and use within 10 min of mixing.

If necessary, dilute with the reference solution (carrier) to give a radioactive concentration sufficient for the detection method, for example 3.7 MBq per millilitre.

Reference solution (carrier). Dissolve 40 mg of *2-iodohippuric acid* R and 40 mg of *2-iodobenzoic acid* R in 4 ml of 0.1 M *sodium hydroxide*, add 10 mg of *potassium iodide* R and dilute to 10 ml with *water* R.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm (about 75 min) using a mixture of 1 volume of *water* R, 4 volumes of *glacial acetic acid* R, 20 volumes of *butanol* R and 80 volumes of *toluene* R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained with the reference solution shows a spot corresponding to 2-iodohippuric acid and nearer to the solvent front a spot corresponding to 2-iodobenzoic acid. Iodide ion remains near the starting-line. Determine the distribution of radioactivity using a suitable detector. In the chromatogram obtained with the test solution, not less than 96 per cent of the total radioactivity is found in the spot corresponding to 2-iodohippuric acid and not more than 2 per cent of the total radioactivity is found in either of the spots corresponding to 2-iodobenzoic acid and to iodide ion.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised iodine-123 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

LABELLING

The label states whether or not the preparation is suitable for renal plasma-flow studies.

01/2005:0282

SODIUM IODOHIPPURATE (¹³¹I) INJECTION

Natrii iodohippurati (¹³¹I) solutio iniectionis

DEFINITION

Sodium iodohippurate (¹³¹I) injection is a sterile solution of sodium 2-(2-[¹³¹I]iodobenzamido)acetate. It may contain a suitable buffer and a suitable antimicrobial preservative such as benzyl alcohol. Iodine-131 is a radioactive isotope of iodine and may be obtained by neutron irradiation of tellurium or by extraction from uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label. Not less than 96 per cent of the iodine-131 is in the form of sodium 2-iodohippurate. The specific radioactivity is 0.74 GBq to 7.4 GBq of iodine-131 per gram of sodium 2-iodohippurate.

CHARACTERS

A clear, colourless liquid.

Iodine-131 has a half-life of 8.04 days and emits beta and gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution. Standardised iodine-131 solutions are available from

laboratories recognised by the competent authority. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.

- B. Examine the chromatograms obtained in the test for radiochemical purity. The main peak of radioactivity in the chromatogram obtained with the test solution is similar in position to the spot corresponding to 2-iodohippuric acid in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3). The pH of the injection is 6.0 to 8.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised iodine-131 solution. Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present. Iodine-133 has a half-life of 20.8 h and its most prominent gamma photons have energies of 0.530 MeV and 0.875 MeV. Iodine-135 has a half-life of 6.55 h and its most prominent gamma photons have energies of 0.527 MeV, 1.132 MeV and 1.260 MeV. Not less than 99.9 per cent of the total radioactivity is due to iodine-131.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using *silica gel GF₂₅₄* R as the coating substance.

Test solution. Dissolve 1 g of *potassium iodide R* in 10 ml of *water R*, add 1 volume of this solution to 10 volumes of the injection to be examined and use within 10 min of mixing. If necessary dilute with the reference solution (carrier) to give a radioactive concentration sufficient for the detection method, for example 3.7 MBq per millilitre.

Reference solution (carrier). Dissolve 40 mg of *2-iodohippuric acid R* and 40 mg of *2-iodobenzoic acid R* in 4 ml of *0.1 M sodium hydroxide*, add 10 mg of *potassium iodide R* and dilute to 10 ml with *water R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm (about 75 min) using a mixture of 1 volume of *water R*, 4 volumes of *glacial acetic acid R*, 20 volumes of *butanol R* and 80 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained with the reference solution shows a spot corresponding to 2-iodohippuric acid and nearer to the solvent front a spot corresponding to 2-iodobenzoic acid. Iodide ion remains near the starting-line. Determine the distribution of radioactivity using a suitable detector. In the chromatogram obtained with the test solution, not less than 96 per cent of the total radioactivity is found in the spot corresponding to 2-iodohippuric acid and not more than 2 per cent of the total radioactivity is found in either of the spots corresponding to 2-iodobenzoic acid and to iodide ion.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised iodine-131 solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

LABELLING

The label states that the preparation is not necessarily suitable for renal plasma-flow studies.

01/2005:0124

SODIUM PERTECHNETATE (^{99m}Tc) INJECTION (FISSION)

Natrii pertechnetatis (^{99m}Tc) fissionis formati solutio iniectionis

This monograph applies to sodium pertechnetate (^{99m}Tc) injection obtained from molybdenum-99 extracted from fission products of uranium. Sodium pertechnetate (^{99m}Tc) injection obtained from molybdenum-99 produced by the neutron irradiation of molybdenum is described in the monograph on Sodium pertechnetate (^{99m}Tc) injection (non-fission) (0283).

DEFINITION

Sodium pertechnetate (^{99m}Tc) injection (fission) is a sterile solution containing technetium-99m in the form of pertechnetate ion and made isotonic by the addition of sodium chloride. Technetium-99m is a radionuclide formed by the decay of molybdenum-99. Molybdenum-99 is a radioactive isotope of molybdenum extracted from uranium fission products. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to technetium-99m in the form of pertechnetate ion.

The radioactivity due to radionuclides other than technetium-99m, apart from that due to technetium-99 resulting from the decay of technetium-99m, is not greater than that shown below, expressed as a percentage of the total radioactivity and calculated with reference to the date and hour of administration.

molybdenum-99	0.1 per cent
iodine-131	5×10^{-3} per cent
ruthenium-103	5×10^{-3} per cent
strontium-89	6×10^{-5} per cent
strontium-90	6×10^{-6} per cent
alpha-emitting impurities	1×10^{-7} per cent
other gamma-emitting impurities	0.01 per cent

The injection may be prepared from a sterile preparation of molybdenum-99 under aseptic conditions.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by measurement in an instrument calibrated with the aid of such a solution. Standardised technetium-99m, molybdenum-99, iodine-131, ruthenium-103, strontium-89 and strontium/yttrium-90

solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

TESTS

pH (2.2.3). The pH of the injection is 4.0 to 8.0.

Aluminium. In a test tube about 12 mm in internal diameter, mix 1 ml of *acetate buffer solution pH 4.6 R* and 2 ml of a 1 in 2.5 dilution of the injection in *water R*. Add 0.05 ml of a 10 g/l solution of *chromazurol S R*. After 3 min, the colour of the solution is not more intense than that of a standard prepared at the same time and in the same manner using 2 ml of *aluminium standard solution (2 ppm Al) R* (5 ppm).

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Preliminary test. To obtain an approximate estimate before use of the injection, take a volume equivalent to 37 MBq and determine the gamma-ray spectrum using a sodium iodide detector with a shield of lead, of thickness 6 mm, interposed between the sample and the detector. The response in the region corresponding to the 0.740 MeV photon of molybdenum-99 does not exceed that obtained using 37 kBq of a standardised molybdenum-99 solution measured under the same conditions, when all measurements are expressed with reference to the date and hour of administration.

Definitive test. Retain a sample of the injection for a sufficient time to allow the technetium-99m radioactivity to decay to a sufficiently low level to permit the detection of radionuclidic impurities. All measurements of radioactivity are expressed with reference to the date and hour of administration.

- **Molybdenum-99.** Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated with the aid of a standardised molybdenum-99 solution. The most prominent photons have energies of 0.181 MeV, 0.740 MeV and 0.778 MeV. Molybdenum-99 has a half-life of 66.0 h. Not more than 0.1 per cent of the total radioactivity is due to molybdenum-99.
- **Iodine-131.** Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated with the aid of a standardised iodine-131 solution. The most prominent photon has an energy of 0.365 MeV. Iodine-131 has a half-life of 8.04 days. Not more than 5×10^{-3} per cent of the total radioactivity is due to iodine-131.
- **Ruthenium-103.** Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated using a standardised ruthenium-103 solution. The most prominent photon has an energy of 0.497 MeV. Ruthenium-103 has a half-life of 39.3 days. Not more than 5×10^{-3} per cent of the total radioactivity is due to ruthenium-103.
- **Strontium-89.** Determine the presence of strontium-89 in the decayed material with an instrument suitable for the detection of beta rays, by comparison with a standardised strontium-89 solution. It is usually necessary first to carry out chemical separation of the strontium so that the standard and the sample may be compared in the same physical and chemical form. Strontium-89 decays with a beta emission of 1.492 MeV maximum energy and has a half-life of 50.5 days. Not more than 6×10^{-5} per cent of the total radioactivity is due to strontium-89.
- **Strontium-90.** Determine the presence of strontium-90 in the decayed material with an instrument suitable for the detection of beta rays. To distinguish strontium-90 from

strontium-89, compare the radioactivity of yttrium-90, the daughter nuclide of strontium-90, with an yttrium-90 standard after the chemical separation of the yttrium. If prior chemical separation of the strontium is necessary, the conditions of radioactive equilibrium must be ensured. The yttrium-90 standard and the sample must be compared in the same physical and chemical form. Strontium-90 and yttrium-90 decay with respective beta emissions of 0.546 MeV and 2.284 MeV maximum energy and half-lives of 29.1 years and 64.0 h. Not more than 6×10^{-6} per cent of the total radioactivity is due to strontium-90.

- **Other gamma-emitting impurities.** Examine the gamma-ray spectrum of the decayed material for the presence of other radionuclidic impurities, which should, where possible, be identified and quantified. The total gamma radioactivity due to these impurities does not exceed 0.01 per cent of the total radioactivity.
- **Alpha-emitting impurities.** Measure the alpha radioactivity of the decayed material to detect any alpha-emitting radionuclidic impurities, which should, where possible, be identified and quantified. The total alpha radioactivity due to these impurities does not exceed 1×10^{-7} per cent of the total radioactivity.

RADIOCHEMICAL PURITY

Examine by descending paper chromatography (2.2.26).

Test solution. Dilute the preparation to be examined with *water R* to a suitable radioactive concentration.

Apply 5 μl of the test solution. Develop for 2 h using a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*. Allow the paper to dry. Determine the distribution of radioactivity using a suitable detector. Not less than 95 per cent of the total radioactivity is in the spot corresponding to pertechnetate ion, which has an R_f value of about 0.6.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:0283

SODIUM PERTECHNETATE (^{99m}Tc) INJECTION (NON-FISSION)

Natrii pertechnetatis (^{99m}Tc) sine fissione formati solutio iniectionabilis

This monograph applies to sodium pertechnetate (^{99m}Tc) injection obtained from molybdenum-99 produced by neutron irradiation of molybdenum. Sodium pertechnetate (^{99m}Tc) injection obtained from molybdenum-99 extracted from fission products of uranium is described in the monograph on Sodium pertechnetate (^{99m}Tc) injection (fission) (0124).

DEFINITION

Sodium pertechnetate (^{99m}Tc) injection (non-fission) is a sterile solution containing technetium-99m in the form of pertechnetate ion and made isotonic by the addition of sodium chloride. Technetium-99m is a radionuclide formed by the decay of molybdenum-99. Molybdenum-99 is a radioactive isotope of molybdenum produced by neutron irradiation of molybdenum. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and

hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to technetium-99m in the form of pertechnetate ion.

The radioactivity due to radionuclides other than technetium-99m, apart from that due to technetium-99 resulting from the decay of technetium-99m is not greater than that shown below, expressed as a percentage of the total radioactivity and calculated with reference to the date and hour of administration.

Molybdenum-99	0.1 per cent
Other radionuclidic impurities	0.01 per cent

The injection may be prepared from a sterile preparation of molybdenum-99 under aseptic conditions.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the injection is 4.0 to 8.0.

Aluminium. In a test tube about 12 mm in internal diameter, mix 1 ml of *acetate buffer solution pH 4.6 R* and 2 ml of a 1 in 2.5 dilution of the injection in *water R*. Add 0.05 ml of a 10 g/l solution of *chromazurol S R*. After 3 min, the colour of the solution is not more intense than that of a standard prepared at the same time in the same manner using 2 ml of *aluminium standard solution (2 ppm Al) R* (5 ppm).

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Preliminary test. To obtain an approximate estimate before use of the injection, take a volume equivalent to 37 MBq and record the gamma-ray spectrum using a sodium iodide detector with a shield of lead, of thickness 6 mm, interposed between the sample and the detector. The response in the region corresponding to the 0.740 MeV photon of molybdenum-99 does not exceed that obtained using 37 kBq of a standardised solution of molybdenum-99 measured under the same conditions, when all measurements are expressed with reference to the date and hour of administration.

Definitive test. Retain a sample of the injection for a sufficient time to allow the technetium-99m radioactivity to decay to a sufficiently low level to permit the detection of radionuclidic impurities. All measurements of radioactivity are expressed with reference to the date and hour of administration.

- *Molybdenum-99.* Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated using a standardised molybdenum-99 solution. The most prominent gamma photons have energies of 0.181 MeV, 0.740 MeV and 0.778 MeV. Molybdenum-99 has a half-life of 66.0 h. Not more than 0.1 per cent of the total radioactivity is due to molybdenum-99.
- *Other gamma-emitting impurities.* Examine the gamma-ray spectrum of the decayed material for the presence of other radionuclidic impurities, which should, where possible, be identified and quantified. The total radioactivity due to other radionuclidic impurities does not exceed 0.01 per cent of the total radioactivity.

RADIOCHEMICAL PURITY

Examine by descending paper chromatography (2.2.26).

Test solution. Dilute the injection with *water R* to a suitable radioactive concentration.

Apply 5 µl of the test solution. Develop for 2 h using a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*. Allow the paper to dry in air. Determine the distribution of radioactivity using a suitable detector. Not less than 95 per cent of the total radioactivity is found in the spot corresponding to pertechnetate ion, which has an *R_f* value of about 0.6.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:0284

SODIUM PHOSPHATE (³²P) INJECTION

Natrii phosphatis (³²P) solutio iniectabilis

DEFINITION

Sodium phosphate (³²P) injection is a sterile solution of disodium and monosodium (³²P) orthophosphates made isotonic by the addition of sodium chloride. Phosphorus-32 is a radioactive isotope of phosphorus and may be produced by neutron irradiation of sulphur. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared phosphorus-32 radioactivity at the date and hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to phosphorus-32 in the form of orthophosphate ion. The specific radioactivity is not less than 11.1 MBq of phosphorus-32 per milligram of orthophosphate ion.

CHARACTERS

A clear, colourless solution.

Phosphorus-32 has a half-life of 14.3 days and emits beta radiation.

IDENTIFICATION

- A. Record the beta-ray spectrum or the beta-ray absorption curve using a suitable method. The spectrum or curve does not differ significantly from that of a standardised phosphorus-32 solution obtained under the same conditions. Standardised phosphorus-32 solutions are available from laboratories recognised by the competent authority. The maximum energy of the beta radiation is 1.71 MeV.
- B. Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the injection is 6.0 to 8.0.

Phosphates. Dilute the injection with *water R* to give a radioactive concentration of 370 kBq of phosphorus-32 per millilitre. Mix in a volumetric flask, with shaking, 1.0 ml of the solution with a mixture of 0.5 ml of a 2.5 g/l solution of *ammonium vanadate R*, 0.5 ml of *ammonium molybdate solution R* and 1 ml of *perchloric acid R* and dilute to 5.0 ml with *water R*. After 30 min, the solution is not more intensely coloured than a standard prepared at the same time in the same manner using 1.0 ml of a solution containing 33 mg of orthophosphate ion per litre.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the beta-ray spectrum or the beta-ray absorption curve using a suitable method. The spectrum or curve does not differ significantly from that of a standardised phosphorus-32 solution obtained under the same conditions.

RADIOCHEMICAL PURITY

Examine by ascending paper chromatography (2.2.26). **Test solution.** Dilute the injection with *water R* until the radioactivity is equivalent to 10 000 to 20 000 counts per minute per 10 µl

Reference solution. Prepare a solution of *phosphoric acid R* containing 2 mg of phosphorus per millilitre.

Using a strip of paper 25 mm wide and about 300 mm long, apply 10 µl of the reference solution. Apply to the same starting-point 10 µl of the test solution. Develop for 16 h using a mixture of 0.3 ml of *ammonia R*, 5 g of *trichloroacetic acid R*, 25 ml of *water R* and 75 ml of *2-propanol R*. Allow the paper to dry in air. Determine the position of the inactive phosphoric acid by spraying with a 50 g/l solution of *perchloric acid R* and then with a 10 g/l solution of *ammonium molybdate R*. Expose the paper to *hydrogen sulphide R*. A blue colour develops. Determine the position of the radioactive spot by autoradiography or by measuring the radioactivity over the whole length of the chromatogram. Not less than 95 per cent of the total radioactivity of the chromatogram is found in the spot corresponding to phosphoric acid.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised phosphorus-32 solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:1475

STRONTIUM (⁸⁹Sr) CHLORIDE INJECTION

Strontii (⁸⁹Sr) chloridi solutio iniectionabilis

DEFINITION

Strontium (⁸⁹Sr) chloride injection is a sterile solution of [⁸⁹Sr]strontium chloride. Strontium-89 is a radioactive isotope of strontium and is produced by neutron irradiation of strontium enriched in strontium-88. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared strontium-89 radioactivity at the date stated on the label. Not more than 0.6 per cent of

the total radioactivity is due to radionuclides other than strontium-89. The specific radioactivity is not less than 1.8 MBq of strontium-89 per milligram of strontium. The injection contains 6.0 mg/ml to 12.5 mg/ml of strontium.

CHARACTERS

A clear, colourless solution.

Strontium-89 has a half-life of 50.5 days and emits beta radiation with a maximum energy of 1.492 MeV.

IDENTIFICATION

- Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised strontium-89 solution, when measured either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised strontium-89 solutions are available from laboratories recognised by the competent authority. The gamma photon detected has an energy of 0.909 MeV and is due to the short-lived daughter product, yttrium-89m (formed in 0.01 per cent of the disintegrations), in equilibrium with the strontium-89.
- To 0.1 ml of the injection to be examined, add 1 ml of a freshly prepared 1 g/l solution of *sodium rhodizonate R*. Mix and allow to stand for 1 min. A reddish-brown precipitate is formed.
- To 0.1 ml of *silver nitrate solution R2* add 50 µl of the injection to be examined. A white precipitate is formed.

TESTS

pH (2.2.3). The pH of the solution is 4.0 to 7.5.

Note: the following tests for aluminium, iron and lead may be carried out simultaneously with the test for strontium. If this is not the case, the reference solutions are prepared such that they contain strontium at approximately the same concentration as in the test solution.

Aluminium. Not more than 2 µg/ml, determined by atomic emission spectrometry (plasma or arc method) (2.2.22, *Method I*).

Test solution. Dilute 0.2 ml of the injection to be examined to a suitable volume with *dilute nitric acid R*.

Reference solutions. Prepare the reference solutions using *aluminium standard solution (10 ppm Al) R* diluted as necessary with *dilute nitric acid R*.

Iron. Not more than 5 µg/ml, determined by atomic emission spectrometry (plasma or arc method) (2.2.22, *Method I*).

Test solution. Dilute 0.2 ml of the injection to be examined to a suitable volume with *dilute nitric acid R*.

Reference solutions. Prepare the reference solutions using *iron standard solution (20 ppm Fe) R* diluted as necessary with *dilute nitric acid R*.

Lead. Not more than 5 µg/ml, determined by atomic emission spectrometry (plasma or arc method) (2.2.22, *Method I*).

Test solution. Dilute 0.2 ml of the injection to be examined to a suitable volume with *dilute nitric acid R*.

Reference solutions. Prepare the reference solutions using *lead standard solution (10 ppm Pb) R* diluted as necessary with *dilute nitric acid R*.

Strontium. 6.0 mg/ml to 12.5 mg/ml. Examine by atomic emission spectrometry (2.2.22, *Method I*).

Test solution. Dilute 0.2 ml of the injection to be examined to a suitable volume with *dilute nitric acid R*.

Reference solutions. Prepare the reference solutions using *strontium standard solution (1.0 per cent Sr) R* diluted as necessary with *dilute nitric acid R*.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125).

RADIONUCLIDIC PURITY

Gamma emitters. Record the gamma-ray and X-ray spectrum of the injection to be examined using a suitable instrument. Not more than 0.4 per cent of the total radioactivity in the preparation to be examined is due to gamma emitting radionuclides other than yttrium-89m.

Beta emitters. Evaporate to dryness 100 µl of the injection to be examined under a radiant heat source. Dissolve the residue in 2 ml of *47 per cent hydrobromic acid R*, evaporate to dryness under the radiant heat source and dissolve the residue in 2 ml of *dilute hydrobromic acid R1*. Transfer the solution to the top of a column, 5 mm to 6 mm in diameter, packed with approximately 2 ml of *cationic exchange resin R1* (100 µm to 250 µm), previously conditioned with *dilute hydrobromic acid R1* and elute the column with the same solvent until 10 ml of eluate has been collected into a container containing 50 µl of a 15 g/l solution of *anhydrous sodium sulphate R* in *1 M hydrochloric acid*.

To a liquid scintillation vial add an appropriate volume of scintillation liquid followed by 1 ml of *water R*, 0.1 ml of a 15 g/l solution of *anhydrous sodium sulphate R* in *1 M hydrochloric acid* and 100 µl of eluate. Shake to obtain a clear solution. Using suitable counting equipment determine the radioactivity due to sulphur-35 and phosphorus-32 in the sample.

Taking into account the recovery efficiency of the separation, counting efficiency and radioactive decay, determine the radioactive concentration of sulphur-35 and phosphorus-32 in the sample and hence the percentage of total beta emitting impurities in the injection to be examined. Not more than 0.2 per cent of the total radioactivity in the injection to be examined is due to the sum of sulphur-35 and phosphorus-32 radioactivities.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised strontium-89 solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:0126

TECHNETIUM (^{99m}Tc) COLLOIDAL RHENIUM SULPHIDE INJECTION

Rhenii sulfidi colloidalis et technetii (^{99m}Tc) solutio iniectionabilis

DEFINITION

Technetium (^{99m}Tc) colloidal rhenium sulphide injection is a sterile, apyrogenic colloidal dispersion of rhenium sulphide the micelles of which are labelled with technetium-99m. It is stabilised with gelatin. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 92 per cent of the radioactivity corresponds to technetium-99m in colloidal form. The pH of the injection may be adjusted by the addition of a suitable buffer such as a citrate buffer solution. The injection contains a variable amount of colloidal rhenium sulphide, not exceeding 0.22 mg of rhenium (Re) per millilitre, according to the method of preparation.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile, apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A light-brown liquid.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the injection.
- To 1 ml add 5 ml of *hydrochloric acid R*, 5 ml of a 50 g/l solution of *thiourea R* and 1 ml of a 200 g/l solution of *stannous chloride R* in *hydrochloric acid R*. A yellow colour is produced.

TESTS

pH (2.2.3). The pH of the injection is 4.0 to 7.0.

Rhenium

Test solution. Use 1 ml of the injection to be examined.

Reference solutions. Using a solution containing 100 µg of *potassium perrhenate R* (equivalent to 60 ppm of Re) and 240 µg of *sodium thiosulphate R* per millilitre, prepare a suitable range of solutions and dilute to the same final volume with *water R*.

To the test solution and to 1 ml of each of the reference solutions add 5 ml of *hydrochloric acid R*, 5 ml of a 50 g/l solution of *thiourea R* and 1 ml of a 200 g/l solution of *stannous chloride R* in *hydrochloric acid R* and dilute to 25.0 ml with *water R*. Allow to stand for 40 min and measure the absorbance (2.2.25) of each solution at 400 nm, using a reagent blank as the compensation liquid. Using the absorbances obtained with the reference solutions, draw a calibration curve and calculate the concentration of rhenium in the injection to be examined.

Physiological distribution. Inject a volume not greater than 0.2 ml into the caudal vein of each of three mice each weighing 20 g to 25 g. Sacrifice the mice 20 min after the injection, remove the liver, spleen and lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs from the expression:

$$\frac{A}{B} \times 100$$

- A* = radioactivity of the organ concerned,
B = total radioactivity in the liver, the spleen, the lungs and the rest of the body.

In each of the three mice at least 80 per cent of the radioactivity is found in the liver and spleen and not more than 5 per cent in the lungs. If the distribution of radioactivity in one of the three mice does not correspond

to the prescribed proportions, repeat the test on a further three mice. The preparation complies with the test if the prescribed distribution of radioactivity is found in five of the six mice used. The injection may be released for use before completion of the test.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Pyrogens. It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. Inject not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by ascending paper chromatography (2.2.26). Apply to the paper 10 µl of the injection. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R*. Allow the paper to dry. Determine the distribution of radioactivity using a suitable detector. Technetium-99m in colloidal form remains at the starting-point and pertechnetate ion migrates with an *R_f* of about 0.6. There may be other impurities with an *R_f* of 0.8 to 0.9. The radioactivity corresponding to technetium-99m in colloidal form represents not less than 92 per cent of the total radioactivity of the chromatogram.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states, in particular, the quantity of rhenium per millilitre.

01/2005:0131

TECHNETIUM (^{99m}Tc) COLLOIDAL SULPHUR INJECTION

Sulfuris colloidalis et technetii (^{99m}Tc) solutio iniectabilis

DEFINITION

Technetium (^{99m}Tc) colloidal sulphur injection is a sterile, apyrogenic colloidal dispersion of sulphur, the micelles of which are labelled with technetium-99m. It may be stabilised with a colloid-protecting substance based on gelatin. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 92 per cent of the radioactivity corresponds to technetium-99m in colloidal form. The pH of the injection may be adjusted by the addition of a suitable buffer, such as an acetate, citrate or phosphate buffer solution. The injection contains a variable amount of colloidal sulphur, according to the method of preparation.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile, apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear to opalescent, colourless to yellowish liquid.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- Examine the chromatogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the injection.
- In a test-tube 100 mm long and 16 mm in internal diameter, evaporate 0.2 ml of the injection to dryness. Dissolve the sulphur by shaking the residue with 0.2 ml of *pyridine R* and add about 20 mg of *benzoïn R*. Cover the open end of the tube with a filter paper moistened with *lead acetate solution R*. Heat the test-tube in a bath containing glycerol at 150 °C. The paper slowly becomes brown.

TESTS

pH (2.2.3). The pH of the injection is 4.0 to 7.0.

Physiological distribution. Inject a volume not greater than 0.2 ml into the caudal vein of each of 3 mice, each weighing 20 g to 25 g. Sacrifice the mice 20 min after the injection, remove the liver, spleen and lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs from the expression:

$$\frac{A}{B} \times 100$$

- A* = radioactivity of the organ concerned,
B = total radioactivity in the liver, the spleen, the lungs and the rest of the body.

In each of the 3 mice at least 80 per cent of the radioactivity is found in the liver and spleen and not more than 5 per cent in the lungs. If the distribution of radioactivity in 1 of the 3 mice does not correspond to the prescribed proportions, repeat the test on a further 3 mice. The preparation complies with the test if the prescribed distribution of radioactivity is found in 5 of the 6 mice used. The injection may be released for use before completion of the test.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Pyrogens. It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. Inject not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by ascending paper chromatography (2.2.26). Apply to the paper 10 µl of the injection. Develop immediately over a path of 10 cm to 15 cm with a 9 g/l solution of *sodium chloride R*. Allow the paper to dry. Determine the distribution of radioactivity using a suitable detector. Technetium-99m in colloidal form remains at the starting-point and pertechnetate ion migrates with an *R_f*

of 0.6. There may be other impurities of R_f 0.8 to 0.9. The radioactivity corresponding to technetium-99m in colloidal form represents not less than 92 per cent of the total radioactivity of the chromatogram.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:0689

TECHNETIUM (^{99m}Tc) COLLOIDAL TIN INJECTION

Stanni colloidalis et technetii (^{99m}Tc) solutio iniectionabilis

DEFINITION

Technetium (^{99m}Tc) colloidal tin injection is a sterile, colloidal dispersion of tin labelled with technetium-99m. The injection contains a variable quantity of tin not exceeding 1 mg of Sn per millilitre; it contains fluoride ions, it may be stabilised with a suitable, apyrogenic colloid-protecting substance and it may contain a suitable buffer. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95 per cent of the radioactivity corresponds to technetium-99m in colloidal form.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration. Syringes for handling the eluate intended for labelling of the final product, or the final product, should not contain rubber parts.

CHARACTERS

A clear or opalescent, colourless liquid.

Technetium-99m has a half life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- Mix 0.05 ml of *zirconyl nitrate solution R* with 0.05 ml of *alizarin S solution R*. Add 0.05 ml of the injection to be examined. A yellow colour is produced.

TESTS

pH (2.2.3). The pH of the injection to be examined is 4.0 to 7.0.

Tin

Test solution. Dilute 3.0 ml of the injection to be examined to 50.0 ml with 1 M hydrochloric acid.

Reference solution. Dissolve 0.115 g of *stannous chloride R* in 1 M hydrochloric acid and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of 0.2 M hydrochloric acid. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using 0.2 M hydrochloric acid as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (1 mg of Sn per millilitre).

Physiological distribution. Inject not more than 0.2 ml into a caudal vein of each of three mice, each weighing 20 g to 25 g. Kill the mice 20 min after the injection and remove the liver, spleen and lungs. Measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body, after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs with respect to the total radioactivity of all organs and the rest of the body excluding the tail.

In each of the three mice at least 80 per cent of the radioactivity is found in the liver and spleen and not more than 5 per cent in the lungs. If the distribution of radioactivity in one of the three mice does not correspond to the prescribed proportions, repeat the test on a further three mice. The preparation complies with the test if the prescribed distribution of radioactivity is found in five of the six mice used.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection to be examined. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R* purged with *nitrogen R*. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Technetium-99m in colloidal form remains at the starting point and pertechnetate ion migrates near to the solvent front. Not less than 95 per cent of the technetium-99m radioactivity corresponds to technetium in colloidal form.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:0585

TECHNETIUM (^{99m}Tc) ETIFENIN INJECTION

Technetii (^{99m}Tc) et etifenini solutio iniectionabilis

DEFINITION

Technetium (^{99m}Tc) etifenin injection is a sterile solution which may be prepared by mixing sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) with solutions of etifenin [(2,6-diethylphenyl)carbamoylmethylimino]di-acetic acid; $\text{C}_{16}\text{H}_{22}\text{N}_2\text{O}_5$] and stannous chloride. The injection contains a variable quantity of tin (Sn) not exceeding 0.2 mg/ml. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared

technetium-99m radioactivity at the date and hour stated on the label. Not less than 95.0 per cent of the radioactivity corresponds to technetium-99m complexed with etifenin.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable, sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

B. Examine by liquid chromatography (2.2.29).

Test solution. Dilute the injection to be examined with *methanol R* to obtain a solution containing about 1 mg of etifenin per millilitre.

Reference solution. Dissolve 5.0 mg of *etifenin CRS* in *methanol R* and dilute to 5.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm to 10 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 20 volumes of *methanol R* and 80 volumes of a 14 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 2.5 by the addition of *phosphoric acid R*,
- a spectrophotometer set at 230 nm.

Inject 20 µl of each solution. The principal peak in the chromatogram obtained with the test solution has a similar retention time to the principal peak in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3). The pH of the injection is 4.0 to 6.0.

Physiological distribution. Inject 0.1 ml (equivalent to about 3.7 MBq) into a caudal vein of each of three mice, each weighing 20 g to 25 g. Kill the mice 1 h after the injection. Remove the liver, gall-bladder, small intestine, large intestine and kidneys, collecting excreted urine. Measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity of the rest of the body, after having removed the tail. Determine the percentage of radioactivity in each organ from the expression:

$$\frac{A}{B} \times 100$$

A = radioactivity of the organ concerned,

B = radioactivity of all organs and the rest of the body, excluding the tail.

In not fewer than two mice the sum of the percentages of radioactivity in the gall-bladder and small and large intestine is not less than 80 per cent. Not more than 3 per cent of the radioactivity is present in the liver, and not more than 2 per cent in the kidneys

Tin

Test solution. Dilute 1.0 ml of the injection to be examined to 5.0 ml with 1 M *hydrochloric acid*.

Reference solution. Prepare a reference solution containing 0.075 mg of *stannous chloride R* per millilitre in 1 M *hydrochloric acid*.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycolic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of 0.2 M *hydrochloric acid*. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using 0.2 M *hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (0.2 mg of Sn per millilitre).

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using silicic acid as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. The plate used should be such that during development the mobile phase moves over a distance of 10 cm to 15 cm in about 15 min.

Apply to the plate 5 µl to 10 µl of the injection to be examined. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R*. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Technetium-99m complexed with etifenin migrates almost to the middle of the chromatogram and pertechnetate ion migrates with the solvent front. Impurities in colloidal form remain at the starting point. The radioactivity corresponding to technetium-99m complexed with etifenin represents not less than 95.0 per cent of the total radioactivity of the chromatogram.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:1925

TECHNETIUM (^{99m}Tc) EXAMETAZIME INJECTION

Technetii (^{99m}Tc) exametazimi solutio iniectionis

DEFINITION

Sterile solution of lipophilic technetium-99m exametazime which may be prepared by dissolving a racemic mixture of (3*RS*,9*RS*)-4,8-diaza-3,6,6,9-tetramethylundecane-2,10-dione bisoxime in the presence of a stannous salt in *Sodium pertechnetate (^{99m}Tc) injection (fission) (0124)* or *Sodium pertechnetate (^{99m}Tc) injection (non-fission) (0283)*. It may contain stabilisers and inert additives.

Content: 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

Purity: minimum of 80 per cent of the total radioactivity corresponds to lipophilic technetium-99m exametazime and its *meso* isomer.

CHARACTERS

Appearance: clear solution.

Half-life and nature of radiation of technetium-99m: see *Table of physical characteristics of radionuclides (5.7)*.

IDENTIFICATION

A. Gamma-ray spectrometry.

Comparison: standardised technetium-99m solution, or by using a calibrated instrument. Standardised technetium-99m solutions and/or standardisation services are available from the competent authority.

Results: the spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised technetium-99m solution. The most prominent gamma photon has an energy of 0.141 MeV.

B. Examine the chromatograms obtained in the test Impurity A under Radiochemical purity.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the peak due to lipophilic technetium-99m exametazime in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3): 5.0 to 10.0.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Impurity C. Thin-layer chromatography (2.2.27).

Test solution. The preparation to be examined.

Plate: TLC silica gel plate R; use a glass-fibre plate.

Mobile phase: 9 g/l solution of sodium chloride R.

Application: about 5 μl .

Development: immediate, over 2/3 of the plate.

Drying: in air.

Detection: determine the distribution of radioactivity using a suitable detector.

Retention factors: impurity C = 0.8 to 1.0; lipophilic technetium-99m exametazime and impurities A, B, D and E do not migrate.

Limits:

- **impurity C:** maximum 10 per cent of the total radioactivity.

Total of lipophilic technetium-99m exametazime and impurity A. Thin-layer chromatography (2.2.27).

Test solution. The preparation to be examined.

Plate: TLC silica gel plate R; use a glass-fibre plate.

Mobile phase: methyl ethyl ketone R.

Application: about 5 μl .

Development: immediate, over 2/3 of the plate.

Drying: in air.

Detection: determine the distribution of radioactivity using a suitable detector.

Retention factors: lipophilic technetium-99m exametazime = 0.8 to 1.0, impurity A = 0.8 to 1.0, impurity C = 0.8 to 1.0; impurities B, D and E do not migrate.

Limits: calculate the percentage of radioactivity due to impurities B, D and E from test B (B) and the percentage of the radioactivity due to impurity C from test A (A). Calculate the total percentage of lipophilic technetium-99m exametazime and impurity A from the expression:

$$100 - A - B$$

- **total of lipophilic technetium-99m exametazime and impurity A:** minimum 80 per cent of the total radioactivity.

Impurity A. Liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

Reference solution. Dissolve the contents of a vial of *meso-rich exametazime CRS* in 0.5 ml of a 9 g/l solution of sodium chloride R and transfer to a lead-shielded, nitrogen-filled vial. Add 6 μl of a freshly prepared 1 g/l solution of stannous chloride R in 0.05 M hydrochloric acid and 2.5 ml of sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) containing 370-740 MBq. Mix carefully and use within 30 min of preparation.

Column:

- **size:** $l = 0.25 \text{ m}$, $\varnothing = 4.6 \text{ mm}$,
- **stationary phase:** spherical base-deactivated end-capped octadecylsilyl silica gel for chromatography R (5 μm) with a pore size of 13 nm and a carbon loading of 11 per cent.

Mobile phase: mix 33 volumes of acetonitrile R and 67 volumes of 0.1 M phosphate buffer solution pH 3.0 R.

Flow rate: 1.5 ml/min.

Detection: radioactivity detector.

Injection: loop injector.

Run time: 20 min.

Relative retention with reference to lipophilic technetium-99m exametazime: impurity A = about 1.2.

System suitability: reference solution:

- chromatogram similar to the chromatogram provided with *meso-rich exametazime CRS*,
- **resolution:** minimum of 2 between the peaks due to lipophilic technetium-99m exametazime and to impurity A.

Limits:

- **impurity A:** maximum 5 per cent of the radioactivity due to lipophilic technetium-99m exametazime and impurity A.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised technetium-99m solution or by using a calibrated instrument.

IMPURITIES

- A. *meso* isomer of lipophilic technetium-99m exametazime,
- B. technetium-99m in colloidal form,
- C. [^{99m}Tc]pertechnetate ion,
- D. non lipophilic technetium-99m exametazime complex,
- E. *meso* isomer of non lipophilic technetium-99m exametazime complex.

01/2005:1047

TECHNETIUM (^{99m}Tc) GLUCONATE INJECTION

Technetii (^{99m}Tc) gluconatis solutio iniectionis

DEFINITION

Technetium (^{99m}Tc) gluconate injection is a sterile solution, which may be prepared by mixing solutions of calcium gluconate and a stannous salt or other suitable reducing agent with sodium pertechnetate (^{99m}Tc) injection (fission or non-fission). The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 90 per cent of the radioactivity corresponds to technetium-99m gluconate complex.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A slightly opalescent solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- B. 5 μl of the solution complies with identification A prescribed in the monograph on *Calcium gluconate* (0172).
- C. Examine the chromatograms obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the solution is 6.0 to 8.5.

Physiological distribution. Inject a volume not greater than 0.2 ml into the caudal vein of each of three rats weighing 150 g to 250 g. Measure the radioactivity of the syringe before and after injection. Sacrifice the rats 30 min after the injection. Remove at least 1 g of blood by a suitable method and remove the kidneys, the liver, the bladder plus voided urine and the tail. Weigh the sample of blood.

Determine the radioactivity in the organs, the blood sample and the tail using a suitable instrument. Calculate the percentage of radioactivity in each organ and in 1 g of blood with respect to the total radioactivity calculated as the difference between the two measurements made on the syringe minus the activity in the tail. Correct the blood concentration by multiplying by a factor of $m/200$ where m is the body mass of the rat in grams.

In not fewer than two of the three rats used, the radioactivity in the kidneys is not less than 15 per cent, that in the bladder plus voided urine is not less than 20 per cent and that in the liver is not more than 5 per cent. The radioactivity in the blood, after correction, is not more than 0.50 per cent.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

a) Apply to the plate 5 μl to 10 μl of the solution to be examined. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R*. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Impurities in colloidal form remain at the starting point. Technetium gluconate complex and pertechnetate ion migrate near to the solvent front.

b) Apply to the plate 5 μl to 10 μl of the solution to be examined and allow to dry. Develop over a path of 10 cm to 15 cm using *methyl ethyl ketone R*. Dry in a current of warm air. Determine the distribution of radioactivity using a suitable detector. Pertechnetate ion impurity migrates near to the solvent front. Technetium gluconate complex and technetium in colloidal form remain at the starting point.

The sum of the percentages of radioactivity corresponding to impurities in the chromatograms obtained in test (a) and (b) does not exceed 10 per cent.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:0640

TECHNETIUM (^{99m}Tc) HUMAN ALBUMIN INJECTION

Technetii (^{99m}Tc) humani albumini solutio iniectionis

DEFINITION

Technetium (^{99m}Tc) human albumin injection is a sterile, apyrogenic solution of human albumin labelled with technetium-99m. It contains a reducing substance, such as a tin salt in an amount not exceeding 1 mg of Sn per millilitre;

it may contain a suitable buffer and an antimicrobial preservative. Although, at present, no definite value for a maximum limit of tin can be fixed, available evidence tends to suggest the importance of keeping the ratio of tin to albumin as low as possible. The human albumin used complies with the requirements of the monograph on *Human albumin solution* (0255). The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the quantity of albumin stated on the label. Not less than 80 per cent of the radioactivity is associated with the albumin fractions II to V. Not more than 5.0 per cent of the radioactivity due to technetium-99m corresponds to free pertechnetate, as determined by the method described in the test for radiochemical purity.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile and apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless or pale-yellow solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- B. Using a suitable range of species-specific antisera, carry out precipitation tests on the preparation to be examined. The test is to be carried out using antisera specific to the plasma proteins of each species of domestic animal currently used in the preparation of materials of biological origin in the country concerned. The injection is shown to contain proteins of human origin and gives negative results with antisera specific to plasma proteins of other species.
- C. Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the injection to be examined, both diluted if necessary. The main component of the injection to be examined corresponds to the main component of the normal human serum. The diluted solution may show the presence of small quantities of other plasma proteins.

TESTS

pH (2.2.3). The pH of the injection is 2.0 to 6.5.

Albumin

Reference solution. Dilute *human albumin solution R* with a 9 g/l solution of *sodium chloride R* to a concentration of 5 mg of albumin per millilitre.

To 1.0 ml of the injection to be examined and to 1.0 ml of the reference solution add 4.0 ml of *biuret reagent R* and mix. After exactly 30 min, measure the absorbance (2.2.25) of each solution at 540 nm, using as the compensation liquid a 9 g/l solution of *sodium chloride R* treated in the

same manner. From the absorbances measured, calculate the content of albumin in the injection to be examined in milligrams per millilitre.

Tin

Test solution. To 1.0 ml of the injection to be examined add 1.0 ml of 2 M *hydrochloric acid*. Heat in a water-bath at 100 °C for 30 min. Cool and centrifuge at 300 g for 10 min. Dilute 1.0 ml of the supernatant liquid to 10 ml with 1 M *hydrochloric acid*.

Reference solution. Dissolve 95 mg of *stannous chloride R* in 1 M *hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of 0.2 M *hydrochloric acid*. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using 0.2 M *hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (1 mg of Sn per millilitre).

Physiological distribution. Inject a volume not greater than 0.5 ml and containing not more than 1.0 mg of albumin into a suitable vein such as a caudal vein or a saphenous vein of each of three male rats, each weighing 150 g to 250 g. Measure the radioactivity in the syringe before and after the injection. Kill the rats 30 min after the injection. Take one millilitre of blood by a suitable method and remove the liver and, if a caudal vein has been used for the injection, the tail. Using a suitable instrument determine the radioactivity in 1 ml of blood, in the liver and, if a caudal vein has been used for the injection, in the tail. Determine the percentage of radioactivity in the liver and in 1 ml of blood with respect to the total radioactivity calculated as the difference between the measurements made on the syringe minus the activity in the tail (if a caudal vein has been used for the injection). Correct the blood concentration by multiplying by a factor of $m/200$ where m is the body mass of the rat in grams. In not fewer than two of the three rats used, the radioactivity in the liver is not more than 15 per cent and that in blood, after correction, is not less than 3.5 per cent.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

Bacterial endotoxins (2.6.14): less than 175 V IU/ml, V being the maximum recommended dose in millilitres.

RADIOCHEMICAL PURITY

- A. Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min. Apply to the plate 5 µl to 10 µl of the injection to be examined and allow to dry. Develop over a path of 10 cm to 15 cm using *methyl ethyl ketone R*. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. The technetium-99m human albumin complex remains at the starting-point and pertechnetate ion migrates near to the solvent front. Not more than 5.0 per cent of the technetium-99m radioactivity corresponds to technetium in the form of pertechnetate ion.
- B. Examine by size-exclusion chromatography (2.2.30). **Mobile phase (concentrated).** Dissolve 1.124 g of *potassium dihydrogen phosphate R*, 4.210 g of *disodium hydrogen phosphate R*, 1.17 g of *sodium chloride R* and 0.10 g of *sodium azide R* in 100 ml of *water R*.

Test solution. Mix 0.25 ml of the injection to be examined with 0.25 ml of the mobile phase (concentrated). Use immediately after dilution.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.6 m long and 7.5 mm in internal diameter, packed with *silica gel for size-exclusion chromatography R*,
- as the mobile phase at a flow rate of 0.6 ml/min a mixture of equal volumes of mobile phase (concentrated) and *water R*,
- a radioactivity detector set for technetium-99m,
- a loop injector.

Inject 200 µl of the test solution. Continue the chromatography for at least 10 min after background level is reached.

Peaks are eluted with the following retention times:

I	High molecular mass compound	19-20 min
II	Poly III-albumin	23-24 min
III	Poly II-albumin	25-27 min
IV	Poly I-albumin	28-29 min
V	Human serum albumin	32-33 min
VI	Tin colloid	40-47 min
VII	Pertechnetate	48 min

At least 80 per cent of the radioactivity applied to the column is associated with the albumin fractions II to V.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states:

- the amount of albumin,
- the amount of tin, if any.

01/2005:0296

TECHNETIUM (^{99m}Tc) MACROSALB INJECTION

Technetii (^{99m}Tc) macrosalbi suspensio iniectionabilis

DEFINITION

Technetium (^{99m}Tc) macrosalb injection is a sterile, apyrogenic suspension of human albumin in the form of irregular insoluble aggregates obtained by denaturing human albumin in aqueous solution; the particles are labelled with technetium-99m. The injection contains reducing substances, such as tin salts in an amount not exceeding 3 mg of Sn per millilitre; it may contain a suitable buffer such as acetate, citrate or phosphate buffer and also non-denatured human albumin and an antimicrobial preservative such as benzyl alcohol. The human albumin employed complies with the requirements prescribed in the monograph on *Human albumin solution (0255)*. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 90 per cent of the technetium-99m is bound

to the particles of the suspension as determined by the test for non-filterable radioactivity. The particles have a typical diameter between 10 µm and 100 µm. The specific radioactivity is not less than 37 MBq of technetium-99m per milligram of aggregated albumin at the date and hour of administration.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile and apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A white suspension which may separate on standing.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- B. The tests for non-filterable radioactivity and particle size contribute to the identification of the preparation.
- C. Transfer 1 ml of the injection to a centrifuge tube and centrifuge at 2500 *g* for 5 min to 10 min. Decant the supernatant liquid. To the residue add 5 ml of *cupri-tartaric solution R2*, mix and allow to stand for 10 min. If necessary, heat to dissolve the particles and allow to cool. Add rapidly 0.5 ml of *dilute phosphomolybdotungstic reagent R*, mixing immediately. A blue colour develops.

TESTS

pH (2.2.3). The pH of the injection is 3.8 to 7.5.

Non-filterable radioactivity. Use a polycarbonate membrane filter 13 mm to 25 mm in diameter, 10 µm thick and with circular pores 3 µm in diameter. Fit the membrane into a suitable holder. Place 0.2 ml of the injection on the membrane and filter, adding 20 ml of a 9 g/l solution of *sodium chloride R* during the filtration. The radioactivity remaining on the membrane represents not less than 90 per cent of the total radioactivity of the injection.

Particle size. Examine using a microscope. Dilute the injection if necessary so that the number of particles is just low enough for individual particles to be distinguished. Using a syringe fitted with a needle having a calibre not less than 0.35 mm, place a suitable volume in a suitable counting chamber such as a haemocytometer cell, taking care not to overfill the chamber. Allow the suspension to settle for 1 min and carefully add a cover slide without squeezing the sample. Scan an area corresponding to at least 5000 particles. Not more than 10 particles have a maximum dimension greater than 100 µm. No particle having a maximum dimension greater than 150 µm is present.

Aggregated albumin

Test solution. Transfer a volume of the injection expected to contain about 1 mg of aggregated albumin to a centrifuge tube and centrifuge at about 2500 *g* for 5 min to 10 min. Decant the supernatant liquid. Resuspend the sediment in 2.0 ml of a 9 g/l solution of *sodium chloride R*. Centrifuge at 2500 *g* for 5 min to 10 min. Decant the supernatant liquid.

Resuspend the sediment in 5.0 ml of *sodium carbonate solution R1*. Heat in a water-bath at 80 °C to 90 °C to dissolve the aggregated albumin. Allow to cool, transfer to a volumetric flask and dilute to 10.0 ml with *sodium carbonate solution R1*.

Reference solutions. Prepare a range of reference solutions containing 0.05 mg to 0.2 mg of human albumin per millilitre in *sodium carbonate solution R1*.

Introduce 3.0 ml of each solution separately into 25 ml flasks. To each flask add 15.0 ml of *cupri-tartaric solution R2*, mix and allow to stand for 10 min. Add rapidly 1.5 ml of *dilute phosphomolybdotungstic reagent R* and mix immediately. Allow to stand for 30 min and measure the absorbance (2.2.25) at 750 nm using *sodium carbonate solution R1* as the compensation liquid. Using the absorbances obtained with the reference solutions, draw a calibration curve and calculate the content of aggregated albumin in the injection.

Tin

Test solution. To 1.0 ml of the injection add 1.0 ml of 2 M *hydrochloric acid*. Heat in a water-bath for 30 min. Cool and centrifuge for 10 min at 300 g. Dilute 1.0 ml of the supernatant liquid to 25.0 ml with 1 M *hydrochloric acid*.

Reference solution. Dissolve 0.115 g of *stannous chloride R* in 1 M *hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of 0.2 M *hydrochloric acid*. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using 0.2 M *hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (3 mg of Sn per millilitre).

Physiological distribution. Inject a volume not greater than 0.2 ml into the caudal vein of each of three rats weighing 150 g to 250 g. Kill the rats 15 min after the injection, remove the liver, the spleen and the lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body, including the blood, after having removed the tail. Determine the percentage of radioactivity in the lungs, the liver and the spleen from the expression:

$$\frac{A}{B} \times 100$$

- A = radioactivity of the organ concerned,
B = total radioactivity in the liver, the spleen, the lungs and the rest of the body.

In not fewer than two of the three rats used, at least 80 per cent of the radioactivity is found in the lungs and not more than a total of 5 per cent in the liver and spleen. The injection may be released for use before completion of the test.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Pyrogens. It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. Inject into the animals not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states:

- that the preparation should be shaken before use,
- the quantity of tin per millilitre, if any,
- that the preparation is not to be used if after shaking, the suspension does not appear homogeneous.

01/2005:0641

TECHNETIUM (^{99m}Tc) MEDRONATE INJECTION

Technetii (^{99m}Tc) medronati solutio iniectionis

DEFINITION

Technetium (^{99m}Tc) medronate injection is a sterile solution which may be prepared by mixing solutions of sodium methylenediphosphonate and a stannous salt with sodium pertechnetate (^{99m}Tc) injection (fission or non-fission). The injection contains a variable quantity of tin (Sn) not exceeding 3 mg/ml; it may contain antimicrobial preservatives, antioxidants, stabilisers and buffers. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Radioactivity present as chemical forms other than technetium-99m medronate complex is not greater than 5.0 per cent of the total radioactivity.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- B. Examine the chromatograms obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.
- C. Examine by thin-layer chromatography (2.2.27) using cellulose as the coating substance.

Test solution. Dilute the injection to be examined with *water R* to obtain a solution containing about 0.1 mg to 0.5 mg of sodium medronate per millilitre.

Reference solution. Dissolve a suitable quantity (1 mg to 5 mg) of *medronic acid CRS* in a mixture of a 9.0 g/l solution of *sodium chloride R* and *water R* and dilute to

10 ml with the same solvent so as to obtain a solution similar to the test solution with regard to medronate and sodium chloride concentrations.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm to 14 cm (development time about 4 h) using a mixture of 20 volumes of 2-propanol R, 30 volumes of 1 M hydrochloric acid and 60 volumes of methyl ethyl ketone R. Allow the plate to dry in air and spray with ammonium molybdate solution R4. Expose the plate to ultraviolet light at 254 nm for about 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position and colour to the spot in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3). The pH of the solution is 3.5 to 7.5.

Tin

Test solution. Dilute 1.0 ml of the solution to 50.0 ml with 1 M hydrochloric acid.

Reference solution. Dissolve 0.115 g of stannous chloride R in 1 M hydrochloric acid and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of sodium laurilsulfate R, 0.05 ml of thioglycollic acid R, 0.1 ml of dithiol reagent R and 3.0 ml of 0.2 M hydrochloric acid. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using 0.2 M hydrochloric acid as compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (3 mg of Sn per millilitre).

Physiological distribution. Inject a volume not greater than 0.2 ml, equivalent to not more than 0.05 mg of sodium medronate into a suitable vein such as a caudal vein or the saphenous vein of each of three rats, each weighing 150 g to 250 g. Measure the radioactivity in the syringe before and after injection. Kill the rats 2 h after the injection. Remove one femur, the liver, and some blood. Weigh the blood. Remove the tail if a caudal vein has been used for the injection. Using a suitable instrument measure the radioactivity in the femur, liver, and blood, and in the tail if a caudal vein has been used for the injection. Determine the percentage of radioactivity in each sample from the expression:

$$\frac{A}{B} \times 100$$

- A* = radioactivity of the sample concerned,
B = total radioactivity, which is equal to the difference between the two measurements made on the syringe minus the radioactivity in the tail if a caudal vein has been used for the injection.

Calculate the radioactivity per unit mass in the blood. Correct the blood concentration by multiplying by a factor *m*/200 where *m* is the body mass of the rat in grams.

In not fewer than two of the three rats: not less than 1.5 per cent of the radioactivity is found in the femur; not more than 1.0 per cent is found in the liver and not more than 0.05 per cent per gram is found in the blood.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Use plates such that during development, the mobile phase migrates

10 cm to 15 cm in about 10 min. Determine hydrolysed technetium and technetium in colloidal form by test (a) and pertechnetate ion by test (b).

(a) Apply to the plate 5 µl to 10 µl of the injection. Develop immediately over a path of 10 cm to 15 cm using a 136 g/l solution of sodium acetate R. Allow the plate to dry in air. Determine the distribution of radioactivity using a suitable detector. Hydrolysed technetium and technetium in colloidal form remain at the starting point. Technetium medronate complex and pertechnetate ion migrate near to the solvent front.

(b) Apply to the plate 5 µl to 10 µl of the injection and dry quickly. Develop over a path of 10 cm to 15 cm using methyl ethyl ketone R. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Pertechnetate ion migrates near to the solvent front. Technetium medronate complex and technetium in colloidal form remain at the starting-point.

The percentage of radioactivity corresponding to pertechnetate ion in the chromatogram obtained in test (b) is not greater than 2.0 per cent and the sum of the percentages of radioactivity corresponding to impurities in the chromatograms obtained in test (a) and test (b) (including pertechnetate ion) is not greater than 5.0 per cent.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:1372

TECHNETIUM (^{99m}Tc) MERTIATIDE INJECTION

Technetii (^{99m}Tc) mertiatidi solutio iniectionis

DEFINITION

Technetium (^{99m}Tc) mertiatide injection is a sterile solution which may be prepared by either heating a mixture containing S-benzoylmercaptoacetyltriglycine (betiatide), a weak chelating agent such as tartrate, a stannous salt and sodium pertechnetate (^{99m}Tc) injection (fission or non-fission), or by mixing solutions of mercaptoacetyltriglycine (mertiatide), a stannous salt and sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) at alkaline pH. It may contain stabilisers and a buffer. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and time stated on the label. Not less than 94 per cent of the radioactivity corresponds to technetium-99m in the form of [^{99m}Tc]technetium mertiatide.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- B. Examine the chromatogram obtained in test (b) for radiochemical purity. The principal peak in the chromatogram obtained with the test solution has approximately the same retention time as the principal peak in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3). The pH of the injection is 5.0 to 7.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

(a) Examine by ascending paper chromatography (2.2.26) using a suitable paper as the stationary phase.

Test solution. The solution to be examined.

Apply 2 μl of the test solution to the paper. Develop over a path of 15 cm using a mixture of 40 volumes of *water R* and 60 volumes of *acetonitrile R*. Allow the paper to dry and determine the distribution of the radioactivity using a suitable detector. Not more than 2.0 per cent of the total radioactivity is retained at the origin (R_f value 0.0 to 0.1).

(b) Examine by liquid chromatography (2.2.29).

Test solution. The solution to be examined.

Reference solution. Dissolve with heating on a water-bath 5 mg of *S-benzylmercaptoacetyltryglycine CRS* in 5 ml of *water R*. To 1 ml of this solution in a closed vial filled with *nitrogen R*, add 0.5 ml of a 40 g/l solution of *sodium potassium tartrate R*, 25 μl of a 4 g/l solution of *stannous chloride R* in 0.05 M *hydrochloric acid R* and 370 MBq to 740 MBq of sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) in a volume not exceeding 3 ml. Heat the mixture on a water-bath for 10 min and allow to cool to room temperature.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μm),
- as mobile phase at a flow rate of 1.0 ml/min:
 - Mobile phase A.** A mixture of 7 volumes of *ethanol R* with 93 volumes of a solution of a 1.36 g/l solution of *potassium dihydrogen phosphate R*, adjusted to pH 6.0 with 0.1 M *sodium hydroxide*,
 - Mobile phase B.** A mixture of 10 volumes of *water R* with 90 volumes of *methanol R*,
- a suitable radioactivity detector,
- a 20 μl loop injector.

Equilibrate the column with mobile phase A for 20 min. Inject the test solution and the reference solution. Switch 10 min after each injection to mobile phase B and continue the chromatographic procedure for 15 min.

The test is not valid unless in the chromatogram obtained with the test solution the principal peak has approximately the same retention time as the principal peak in the chromatogram obtained with the reference solution. In the chromatogram obtained with the test solution the sum of the areas preceding the principal peak (corresponding to hydrophilic impurities, including [^{99m}Tc]pertechnetate) is not greater than 3.0 per cent of the sum of the areas of all peaks. The sum of the peaks following the principal peak (corresponding to lipophilic impurities) is not greater than 4.0 percent of the sum of the area of all peaks.

Not less than 94 per cent of the radioactivity corresponds to [^{99m}Tc]technetium mertiatide.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:0570

TECHNETIUM (^{99m}Tc) MICROSPHERES INJECTION

Technetii (^{99m}Tc) microsphaerarum suspensio iniectabilis

DEFINITION

Technetium (^{99m}Tc) microspheres injection is a sterile, apyrogenic suspension of human albumin which has been denatured to form spherical insoluble particles; the particles are labelled with technetium-99m. The injection contains reducing substances, such as tin salts in an amount not exceeding 3 mg of Sn per millilitre; it may contain a suitable buffer such as acetate, citrate or phosphate and additives such as wetting agents. The human albumin used complies with the requirements of the monograph on *Human albumin solution* (0255). The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95 per cent of the technetium-99m is bound to the particles of the suspension as determined by the test for non-filterable radioactivity. The particles have a typical diameter between 10 μm and 50 μm . The radioactivity is not less than 185 MBq of technetium-99m per million particles at the date and hour of administration.

Technetium (^{99m}Tc) microspheres injection is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile and apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A suspension of white, yellow or artificially coloured particles which may separate on standing.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- A. Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are

available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.

- B. The tests for non-filterable radioactivity and particle size contribute to the identification of the preparation.
- C. Transfer 1 ml of the injection to a centrifuge tube and centrifuge at 2500 *g* for 5 min to 10 min. Decant the supernatant liquid. To the residue add 5 ml of *cupri-tartaric solution R2*, mix and allow to stand for 10 min. If necessary, heat to dissolve the particles and allow to cool. Add rapidly 0.5 ml of *dilute phosphomolybdotungstic reagent R*, mix immediately and allow to stand. A blue colour develops.

TESTS

pH (2.2.3). The pH of the injection is 4.0 to 9.0.

Non-filterable radioactivity. Use a polycarbonate membrane filter 13 mm to 25 mm in diameter, 10 µm thick and with circular pores 3 µm in diameter. Fit the membrane into a suitable holder. Place 0.2 ml of the injection on the membrane and filter, adding 20 ml of a 9 g/l solution of *sodium chloride R* during the filtration. The radioactivity remaining on the membrane represents not less than 95 per cent of the total radioactivity of the injection.

Particle size. Examine using a microscope. Dilute the injection if necessary so that the number of particles is just low enough for individual particles to be distinguished. Using a syringe fitted with a needle having a calibre not less than 0.35 mm, place a suitable volume in a suitable counting chamber such as a haemocytometer cell, taking care not to overfill the chamber. Allow the suspension to settle for 1 min and carefully add a cover slide without squeezing the sample. Scan an area corresponding to at least 5000 particles. The particles have a uniform spherical appearance. Not more than 10 particles have a maximum dimension greater than 75 µm. No particle having a maximum dimension greater than 100 µm is present.

Number of particles. Examine using a microscope. Fill a suitable counting chamber such as a haemocytometer cell with a suitable dilution of the injection taking care that particles do not separate during the transfer. Count the number of particles in the chamber. Repeat this procedure twice and calculate the number of particles per millilitre of the injection.

Tin

Test solution. To 1.0 ml of the injection add 0.5 ml of *sulphuric acid R* and 1.5 ml of *nitric acid R*. Heat and evaporate to approximately 1 ml. Add 2 ml of *water R* and evaporate again to approximately 1 ml. Repeat this procedure twice, cool and dilute to 25.0 ml with 1 *M hydrochloric acid*.

Reference solution. Dissolve 0.115 g of *stannous chloride R* in 1 *M hydrochloric acid* and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of 0.2 *M hydrochloric acid*. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using 0.2 *M hydrochloric acid* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (3 mg of Sn per millilitre).

Physiological distribution. Inject a volume not greater than 0.2 ml into a caudal vein of each of three rats weighing 150 g to 250 g. Sacrifice the rats 15 min after the injection, remove the liver, the spleen and the lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body, including

the blood and voided urine, after having discarded the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs from the expression:

$$\frac{A}{B} \times 100$$

- A* = radioactivity of the organ concerned,
B = total radioactivity in the liver, the spleen, the lungs and the rest of the body, including voided urine.

In not fewer than two of the three rats used, not less than 80 per cent of the radioactivity is found in the lungs and not more than a total of 5 per cent in the liver and spleen. The injection may be released for use before completion of the test.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

Pyrogens. It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. Inject not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states:

- the quantity of tin per millilitre, if any,
- that the preparation should be shaken before use.

01/2005:0642

TECHNETIUM (^{99m}Tc) PENTETATE INJECTION

Technetii (^{99m}Tc) pentetatis
 solutio iniectionis

DEFINITION

Technetium (^{99m}Tc) pentetate injection is a sterile solution which may be prepared by mixing solutions of sodium diethylenetriaminepenta-acetate or calcium trisodium diethylenetriaminepenta-acetate and a stannous salt with a solution of sodium pertechnetate (^{99m}Tc). It contains a variable quantity of tin (Sn) not exceeding 1 mg/ml; it may contain suitable antimicrobial preservatives, antioxidants, stabilisers and buffers. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95.0 per cent of the radioactivity corresponds to technetium-99m complexed with sodium pentetate or calcium trisodium pentetate.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable, sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless or slightly yellow solution.

Technetium-99m has a half life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- Examine the chromatograms obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.
- Place in a clean, dry 10 ml glass tube a volume of the injection to be examined containing 2 mg of pentetate. Dilute, if necessary, to 1 ml with *water R*. Place in a second tube 1 ml of *water R* (blank). To each tube add 0.1 ml of a 1 g/l solution of *nickel sulphate R*, 0.5 ml of a 50 per cent *V/V* solution of *glacial acetic acid R* and 0.75 ml of a 50 g/l solution of *sodium hydroxide R*. Mix and verify that the pH is not above 5. To each tube add 0.1 ml of a 10 g/l solution of *dimethylglyoxime R* in *alcohol R*. Mix and allow to stand for 2 min. Adjust the pH in each tube to not less than 12 by adding a 100 g/l solution of *sodium hydroxide R*. Mix and check that the pH is not below 12. Allow to stand for 2 min. Heat the tubes gently on a water-bath for 2 min. The solution in the tube containing the injection to be examined remains clear and colourless throughout. The solution in the blank tube becomes red on addition of dimethylglyoxime solution and a red precipitate is formed when the tube is heated on a water-bath.

TESTS

pH (2.2.3). The pH of the injection is 4.0 to 7.5.

Tin

Test solution. Dilute 1.5 ml of the injection to 25.0 ml with 1 M hydrochloric acid.

Reference solution. Dissolve 0.115 g of *stannous chloride R* in 1 M hydrochloric acid and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycolic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of 0.2 M hydrochloric acid. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using 0.2 M hydrochloric acid as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (1 mg of Sn per millilitre).

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

(a) Apply to the plate 5 µl to 10 µl of the injection to be examined. Develop immediately over a path of 10 cm to 15 cm using a 9 g/l solution of *sodium chloride R*. Allow the plate to dry in air. Determine the distribution of radioactivity

using a suitable detector. Impurities in colloidal form remain at the starting point. Technetium pentetate complex and pertechnetate ion migrate near to the solvent front.

(b) Apply to the plate 5 µl to 10 µl of the injection to be examined and allow to dry. Develop over a path of 10 cm to 15 cm using *methyl ethyl ketone R*. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Pertechnetate ion migrates near to the solvent front. Technetium pentetate complex and impurities in colloidal form remain at the starting point.

The sum of the percentages of radioactivity corresponding to impurities in the chromatograms obtained in test (a) and (b) does not exceed 5.0 per cent.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:1926

TECHNETIUM (^{99m}Tc) SESTAMIBI INJECTION

Technetii (^{99m}Tc) sestamibi solutio iniectionis

DEFINITION

Sterile solution of (OC-6-11)-hexakis[1-(isocyanato-κC)-2-methoxy-2-methylpropane][^{99m}Tc]technetium(I) chloride, which may be prepared by heating a mixture containing [tetraakis(2-methoxy-2-methylpropyl-1-isocyanide)copper (1+)] tetrafluoroborate, a weak chelating agent, a stannous salt and *Sodium pertechnetate (^{99m}Tc) injection (fission)* (0124) or *Sodium pertechnetate (^{99m}Tc) injection (non-fission)* (0283).

Content: 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label.

CHARACTERS

Appearance: clear, colourless solution.

Half-life and nature of radiation of technetium-99m: see *Table of physical characteristics of radionuclides* (5.7).

IDENTIFICATION

A. Gamma-ray spectrometry.

Results: the spectrum obtained with the solution to be examined does not differ significantly from that of a standardised technetium-99m solution. The most prominent gamma photon has an energy of 0.141 MeV.

- B. Examine the chromatograms obtained in the test for impurity C under Radiochemical purity.

Results: the principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the radiochromatogram obtained with the reference solution.

TESTS

pH (2.2.3): 5.0 to 6.0.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Impurity A and other polar impurities. Thin-layer chromatography (2.2.27).

Test solution. The preparation to be examined.

Plate: TLC octadecylsilyl silica gel plate R.

Mobile phase: mix 10 volumes of tetrahydrofuran R, 20 volumes of a 38.5 g/l solution of ammonium acetate R, 30 volumes of methanol R and 40 volumes of acetonitrile R.

Application: about 5 µl.

Development: immediately over a path of 6 cm.

Drying: in air.

Detection: determine the distribution of radioactivity using a radioactivity detector.

Retention factors: impurity B and apolar impurities = 0 to 0.1; impurity C and technetium-99m sestamibi = 0.3 to 0.6; impurity A and other polar impurities = 0.9 to 1.0.

Limit: see test for impurity B.

Impurity B. Paper chromatography (2.2.26). *If no activity is found at retention factor 0 to 0.1 in the test for impurity A and other polar impurities, impurity B is absent and the test for impurity B may be omitted.*

Test solution. The preparation to be examined.

Paper: paper for chromatography R.

Mobile phase: mix equal volumes of acetonitrile R, 0.5 M acetic acid and a 20 g/l solution of sodium chloride R.

Application: about 5 µl.

Development: over a path of 10 cm.

Drying: in air.

Detection: determine the distribution of radioactivity using a radioactivity detector.

Retention factors: impurity B = 0 to 0.1; impurity A, impurity C and technetium-99m sestamibi = 0.8 to 1.0.

Limit:

- *sum of impurity A and other polar impurities, and impurity B:* maximum 5 per cent of the total radioactivity.

Impurity C. Liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

Reference solution. To a vial of sestamibi labelling kit CRS add 3 ml of a 9 g/l solution of sodium chloride R containing 700 MBq to 900 MBq of sodium pertechnetate (^{99m}Tc) injection (fission or non-fission). Heat the mixture in a water-bath for 10 min and allow to cool to room temperature.

Column:

- *size:* $l = 0.25$ m, $\varnothing = 4.6$ mm,

- *stationary phase:* spherical base-deactivated end-capped octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: mix 20 volumes of acetonitrile R, 35 volumes of a 6.6 g/l solution of ammonium sulphate R and 45 volumes of methanol R.

Flow rate: 1.5 ml/min.

Detection: radioactivity detector.

Injection: 25 µl.

Run time: 25 min.

Relative retention with reference to technetium-99m sestamibi: impurity C = about 1.3.

System suitability: reference solution:

- the chromatogram is similar to the chromatogram provided with sestamibi labelling kit CRS,
- *relative retention* with reference to technetium-99m sestamibi: impurity C = minimum 1.2.

Limits:

- *impurity C:* not more than 3 per cent of the total radioactivity,
- *technetium-99m sestamibi:* minimum 94 per cent of the total radioactivity.

Calculate the percentage of radioactivity due to technetium-99m sestamibi from the expression:

$$\frac{(100 - B) \times T}{100}$$

B = percentage of radioactivity due to impurity B determined in the test for impurity B under Radiochemical purity,

T = area of the peak due to technetium-99m sestamibi in the chromatogram obtained with the test solution.

RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

IMPURITIES

A. [^{99m}Tc]O₄[−]: (^{99m}Tc)pertechnetate ion,

B. technetium-99m in colloidal form,

C. (OC-6-22)-pentakis[1-(isocyanido-κC)-2-methoxy-2-methylpropane][1-(isocyanido-κC)-2-methylprop-1-ene][^{99m}Tc]technetium (1+).

01/2005:0643

TECHNETIUM (^{99m}Tc) SUCCIMER INJECTION

Technetii (^{99m}Tc) succimeri solutio iniectionabilis

DEFINITION

Technetium (^{99m}Tc) succimer injection is a sterile solution of *meso*-2,3-dimercaptosuccinic acid labelled with technetium-99m. It contains a reducing substance, such as a tin salt in an amount not exceeding 1 mg of Sn per millilitre, and may contain stabilisers, antioxidants such as ascorbic acid, and inert additives. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 95.0 per cent of the radioactivity corresponds to technetium-99m succimer complex.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration. Syringes for handling the eluate intended for labelling of the final product, or for handling the final product should not contain rubber parts.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- Examine the chromatogram obtained in the test for radiochemical purity. The distribution of the radioactivity contributes to the identification of the preparation.
- Place 1 ml of the injection to be examined in a test-tube and add 1 ml of a 20 g/l solution of *sodium nitroprusside R* and 0.1 ml of *glacial acetic acid R*. Mix. Place carefully at the top of the solution a layer of *concentrated ammonia R*. A violet ring develops between the layers.

TESTS

pH (2.2.3). The pH of the injection is 2.3 to 3.5.

Tin

Test solution. Dilute 1.5 ml of the injection to be examined to 25.0 ml with 1 M hydrochloric acid.

Reference solution. Dissolve 0.115 g of *stannous chloride R* in 1 M hydrochloric acid and dilute to 1000.0 ml with the same acid.

To 1.0 ml of each solution add 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R*, 0.05 ml of *thioglycollic acid R*, 0.1 ml of *dithiol reagent R* and 3.0 ml of 0.2 M hydrochloric acid. Mix. Allow to stand for 60 min. Measure the absorbance (2.2.25) of each solution at 540 nm, using 0.2 M hydrochloric

acid as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (1 mg of Sn per millilitre).

Physiological distribution. Inject a volume not greater than 0.2 ml and containing not more than 0.1 mg of dimercaptosuccinic acid into a suitable vein, such as a caudal vein or a saphenous vein, of each of three rats each weighing 150 g to 250 g. Measure the radioactivity in the syringe before and after the injection. Kill the rats 1 h after the injection. Remove the kidneys, the liver, the stomach, the lungs and, if a caudal vein has been used for the injection, the tail. Using a suitable instrument determine the radioactivity in the organs and, if a caudal vein has been used for injection, in the tail. Determine the percentage of radioactivity in each organ with respect to the total radioactivity calculated as the difference between the two measurements made on the syringe minus the activity in the tail (if a caudal vein has been used for the injection).

In not fewer than two of the three rats used, the radioactivity in the kidneys is not less than 40 per cent, that in the liver is not more than 10.0 per cent, that in the stomach is not more than 2.0 per cent and that in the lungs is not more than 5.0 per cent.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. Use a plate such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection to be examined. Develop immediately over a path of 10 cm to 15 cm using *methyl ethyl ketone R*. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. Technetium succimer complex remains at the starting point. Pertechnetate ion migrates near to the solvent front. Not less than 95.0 per cent of the total radioactivity is found in the spot corresponding to technetium succimer complex. The radioactivity corresponding to pertechnetate ion represents not more than 2.0 per cent of the total radioactivity.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

STORAGE

Store protected from light.

01/2005:0129

TECHNETIUM (^{99m}Tc) TIN PYROPHOSPHATE INJECTION

Stanni pyrophosphatis et technetii (^{99m}Tc) solutio iniectionabilis

DEFINITION

Technetium (^{99m}Tc) tin pyrophosphate injection is a sterile, apyrogenic solution which may be prepared by mixing solutions of sodium pyrophosphate and stannous chloride with sodium pertechnetate (^{99m}Tc) injection (fission or non-fission). The injection contains not less than 90.0 per

cent and not more than 110.0 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label. Not less than 90 per cent of the radioactivity corresponds to technetium-99m complexed with tin pyrophosphate. The injection contains a quantity of sodium pyrophosphate ($\text{Na}_4\text{P}_2\text{O}_7 \cdot 10\text{H}_2\text{O}$) that may vary from 1 mg to 50 mg per millilitre and a variable quantity of tin (Sn) not exceeding 3.0 mg per millilitre.

It is prepared from sodium pertechnetate (^{99m}Tc) injection (fission or non-fission) using suitable sterile, apyrogenic ingredients and calculating the ratio of radionuclidic impurities with reference to the date and hour of administration.

CHARACTERS

A clear, colourless solution.

Technetium-99m has a half-life of 6.02 h and emits gamma radiation.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised technetium-99m solution either by direct comparison or by using an instrument calibrated with the aid of such a solution. Standardised technetium-99m and molybdenum-99 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photon of technetium-99m has an energy of 0.140 MeV.
- Examine the chromatograms obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the injection.
- To 1 ml add 1 ml of *acetic acid R*. Heat on a water-bath for 1 h. After cooling, add 10 ml of *nitro-vanadomolybdic reagent R* and allow to stand for 30 min. A yellow colour develops.
- To 1 ml add 2 ml of a 30 per cent *V/V* solution of *sulphuric acid R*, 1 ml of *hydrochloric acid R*, 0.05 ml of *thioglycollic acid R*, 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R* and 0.1 ml of *dithiol reagent R* and allow to stand for 30 min. A pink colour develops.

TESTS

pH (2.2.3). The pH of the injection is 6.0 to 7.0.

Sodium pyrophosphate

Test solution. Use 1 ml of the injection to be examined or a suitable dilution of it.

Reference solutions. Using a solution containing *sodium pyrophosphate R* and *stannous chloride R* in the same proportions as in the injection to be examined, prepare a range of solutions and dilute to the same final volume with *water R*.

To the test solution and to 1 ml of each of the reference solutions add successively 10 ml of a 1 g/l solution of *disodium hydrogen phosphate R*, 10 ml of *iron standard solution* (8 ppm Fe) *R*, 5 ml of *glacial acetic acid R* and 5 ml of a 1 g/l solution of *hydroxylamine hydrochloride R*. Dilute each solution to 40 ml with *water R* and heat in a water-bath at 40 °C for 1 h. To each solution add 4 ml of a 1 g/l solution of *phenanthroline hydrochloride R* and dilute to 50.0 ml with *water R*. Measure the absorbance (2.2.25) of each solution at 515 nm using as the compensation liquid a reagent blank containing hydrochloric acid (1.1 g/l HCl) instead of the *iron standard solution* (8 ppm Fe) *R*. Using

the absorbances obtained with the reference solutions, draw a calibration curve and calculate the concentration of sodium pyrophosphate in the injection to be examined.

Tin

Test solution. Use 1 ml of the injection to be examined or a suitable dilution of it.

Reference solutions. Using a solution in hydrochloric acid (6.2 g/l HCl) containing *sodium pyrophosphate R* and *stannous chloride R* in the same proportions as in the injection to be examined, prepare a range of solutions and dilute to the same volume with hydrochloric acid (6.2 g/l HCl).

To the test solution and to 1 ml of each of the reference solutions add 2 ml of a 300 g/l solution of *sulphuric acid R*, 1 ml of *hydrochloric acid R*, 0.05 ml of *thioglycollic acid R*, 0.4 ml of a 20 g/l solution of *sodium laurilsulfate R* and 0.1 ml of *dithiol reagent R* and dilute to 15 ml with hydrochloric acid (6.2 g/l HCl). Allow the solutions to stand for 30 min and measure the absorbance (2.2.25) of each solution at 530 nm, using as the compensation liquid a reagent blank containing the same quantity of *sodium pyrophosphate R* as the injection to be examined. Using the absorbances obtained with the reference solutions, draw a calibration curve and calculate the concentration of tin in the injection to be examined.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

Pyrogens. It complies with the test for pyrogens prescribed in the monograph on *Radiopharmaceutical preparations* (0125). Inject not less than 0.1 ml per kilogram of the rabbit's mass. The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

(a) Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. The plate used should be such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection and dry in a stream of nitrogen. Develop over a path of 10 cm to 15 cm using *methyl ethyl ketone R* through which nitrogen has been bubbled in the chromatography tank for 10 min immediately before the chromatography. Allow the plate to dry. Determine the distribution of radioactivity using a suitable detector. The technetium-99m tin pyrophosphate complex remains at the starting-point and pertechnetate ion migrates with an *R_f* of 0.95 to 1.0.

(b) Examine by thin-layer chromatography (2.2.27) using silica gel as the coating substance on a glass-fibre sheet. Heat the plate at 110 °C for 10 min. The plate used should be such that during development the mobile phase migrates over a distance of 10 cm to 15 cm in about 10 min.

Apply to the plate 5 µl to 10 µl of the injection. Develop immediately over a path of 10 cm to 15 cm using a 136 g/l solution of *sodium acetate R*. Allow the plate to dry and measure the distribution of radioactivity using a suitable detector. Impurities in colloidal form remain at the starting-point and technetium-99m tin pyrophosphate complex and pertechnetate ion migrate with an *R_f* of 0.9 to 1.0.

Add together the percentages of radioactivity corresponding to impurities in the chromatograms obtained in test (a) and test (b). The sum does not exceed 10 per cent.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised technetium-99m solution or by measurement in an instrument calibrated with the aid of such a solution.

LABELLING

The label states, in particular, the quantity of sodium pyrophosphate per millilitre and the quantity of tin per millilitre.

01/2005:0571

THALLOUS (^{201}Tl) CHLORIDE INJECTION

Thallosi (^{201}Tl) chloridi solutio iniectionabilis

DEFINITION

Thallous (^{201}Tl) chloride injection is a sterile solution of thallium-201 in the form of thallous chloride. It may be made isotonic by the addition of *Sodium chloride* (0193) and may contain a suitable antimicrobial preservative such as *Benzyl alcohol* (0256). Thallium-201 is a radioactive isotope of thallium formed by the decay of lead-201. Lead-201 is a radioactive isotope of lead and may be obtained by irradiation, with protons of suitable energy, of thallium which may be enriched in thallium-203. Thallium-201 may be separated from lead-201 by passing through a column of an ion-exchange resin. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared thallium-201 radioactivity at the date and hour stated on the label. Not more than 2.0 per cent of the total radioactivity is due to thallium-202 and not less than 97.0 per cent is due to thallium-201. Not less than 95.0 per cent of the radioactivity is due to thallium in the form of thallous ions. The specific radioactivity is not less than 3.7 GBq per milligram of thallium.

CHARACTERS

A clear, colourless solution.

Thallium-201 has a half-life of 3.05 days and emits gamma radiation and X-rays.

IDENTIFICATION

- A. Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised thallium-201 solution when measured either by direct comparison or by use of an instrument calibrated with the aid of such a solution. Standardised thallium-201 and thallium-202 solutions are available from laboratories recognised by the competent authority. The most prominent gamma photons have energies of 0.135 MeV, 0.166 MeV and 0.167 MeV. The X-rays have energies of 0.069 MeV to 0.083 MeV.
- B. Examine the electropherogram obtained in the test for radiochemical purity. The distribution of radioactivity contributes to the identification of the preparation.

TESTS

pH (2.2.3). The pH of the injection is 4.0 to 7.0.

Thallium. To 0.5 ml of the injection add 0.5 ml of hydrochloric acid (220 g/l HCl) and 0.05 ml of *bromine water R* and mix. Add 0.1 ml of a 30 g/l solution of *sulphosalicylic acid R*. After decolorisation add 1.0 ml of a 1 g/l solution of *rhodamine B R*. Add 4 ml of *toluene R* and shake for 60 s. Separate the toluene layer. The toluene

layer is not more intensely coloured than the toluene layer of a standard prepared at the same time in the same manner using 0.5 ml of *thallium standard solution* (10 ppm Tl) R.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

Record the gamma-ray and X-ray spectrum using a suitable instrument calibrated with the aid of standardised thallium-201 and thallium-202 solutions. The spectrum does not differ significantly from that of the standardised thallium-201 solution. Determine the relative amounts of thallium-201 and thallium-202 and other radionuclidic impurities present. Thallium-202 has a half-life of 12.2 days and its most prominent gamma photon has an energy of 0.440 MeV. Thallium-200 has a half-life of 1.09 days and its most prominent gamma photons have energies of 0.368 MeV, 0.579 MeV, 0.828 MeV and 1.206 MeV. Lead-201 has a half-life of 9.4 h and its most prominent gamma photon has an energy of 0.331 MeV. Lead-203 has a half-life of 2.17 days and its most prominent gamma photon has an energy of 0.279 MeV. Not more than 2.0 per cent of the total radioactivity is due to thallium-202 and not less than 97.0 per cent is due to thallium-201.

RADIOCHEMICAL PURITY

Examine by zone electrophoresis (2.2.31), using a suitable strip of cellulose acetate, as the support and a 18.6 g/l solution of *sodium edetate R* as the electrolyte solution. Soak the strip in the electrolyte solution for 45-60 min. Remove the strip with forceps taking care to handle the outer edges only. Place the strip between 2 absorbent pads and blot to remove excess solution.

Test solution. Mix equal volumes of the injection to be examined and the electrolyte solution.

Apply not less than 5 µl of the test solution to the centre of the strip and mark the point of application. Apply an electric field of 17 V/cm for at least 10 min. Allow the strip to dry in air. Determine the distribution of radioactivity using suitable equipment. Not less than 95.0 per cent of the radioactivity migrates towards the cathode.

RADIOACTIVITY

Measure the radioactivity using suitable counting equipment by comparison with a standardised thallium-201 solution or by measurement in an instrument calibrated with the aid of such a solution.

01/2005:0112

TRITIATED (^3H) WATER INJECTION

Aquae tritiatae (^3H) solutio iniectionabilis

DEFINITION

Tritiated (^3H) water injection is water for injections in which some of the water molecules contain tritium atoms in place of protium atoms. It may be made isotonic by the addition of sodium chloride. Tritium (^3H) may be obtained by the neutron irradiation of lithium. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared tritium activity at the date stated on the label.

CHARACTERS

A clear, colourless liquid.

Tritium has a half-life of 12.3 years and emits beta radiation.

IDENTIFICATION

Record the beta-ray spectrum by the method prescribed in the test for radionuclidic purity. The spectrum does not differ significantly from that of a standardised tritiated (³H) water. Standardised tritiated (³H) water is available from laboratories recognised by the competent authority. The maximum energy of the beta radiation is 0.019 MeV.

TESTS

pH (2.2.3). The pH of the injection is 4.5 to 7.0.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125).

RADIONUCLIDIC PURITY

(a) Mix 100 µl of a suitable dilution of the injection with 10 ml of a scintillation liquid consisting of 1000 ml of *dioxan R*, 100 g of *naphthalene R*, 7 g of *diphenyloxazole R* and 0.3 g of *methylphenyloxazolylbenzene R*, the reagents being of an analytical grade suitable for liquid scintillation. Measure the radioactivity of the mixture in a liquid scintillation counter fitted with a discriminator. The count should be about 5000 impulses per second at the lowest setting of the discriminator. Record the count at different discriminator settings. For each measurement count at least 10 000 impulses over a period of at least 1 min. Immediately determine in the same conditions the count for a standardised tritiated (³H) water having approximately the same activity.

Plot the counts at each discriminator setting, correcting for background activity, on semi-logarithmic paper, the discriminator settings being in arbitrary units as the abscissae. The vertical distance between the two curves obtained is constant. They obey the mathematical relationship:

$$\frac{\frac{A_1}{B_1} - \frac{A_2}{B_2}}{\frac{A_1}{B_1}} \times 100 < 20$$

- A_1 = radioactivity recorded for the standardised preparation at the lowest discriminator setting,
 B_1 = radioactivity recorded for the preparation to be examined at the lowest discriminator setting,
 A_2 = radioactivity recorded for the standard at the discriminator setting such that $A_2 \approx A_1 \times 10^{-3}$,
 B_2 = radioactivity recorded for the preparation to be examined at the latter discriminator setting.

(b) Record the gamma-ray spectrum. The instrument registers only background activity.

RADIOCHEMICAL PURITY

Place a quantity of the injection equivalent to about 2 µCi (74 kBq), diluted to 50 ml with *water R*, in an all-glass distillation apparatus of the type used for the determination of distillation range (2.2.11). Determine the radioactive concentration. Distil until about 25 ml of distillate has been collected. Precautions must be taken to avoid contamination of the air. If the test is carried out in a fume cupboard, the equipment must be protected from draughts. Determine the radioactive concentration of the distillate and of the liquid remaining in the distillation flask. Neither of the radioactive concentrations determined after distillation differs by more than 5 per cent from the value determined before distillation.

RADIOACTIVITY

Determine the radioactivity using a liquid scintillation counter.

01/2005:1582

WATER (¹⁵O) INJECTIONAquae (¹⁵O) solutio iniectionabilis

DEFINITION

Water (¹⁵O) injection is a sterile solution of [¹⁵O]water for diagnostic use. The injection contains not less than 90.0 per cent and not more than 110.0 per cent of the declared oxygen-15 radioactivity at the date and time stated on the label. Not less than 99 per cent of the total radioactivity corresponds to oxygen-15 in the form of water.

PRODUCTION

RADIONUCLIDE PRODUCTION

Oxygen-15 is a radioactive isotope of oxygen which may be produced by various nuclear reactions such as proton irradiation of nitrogen-15 or deuteron irradiation of nitrogen-14.

RADIOCHEMICAL SYNTHESIS

In order to recover oxygen-15 as molecular oxygen from the nitrogen target gas, carrier oxygen is added at concentrations generally ranging from 0.2 per cent V/V to 1.0 per cent V/V. [¹⁵O]Water can be prepared from [¹⁵O]oxygen by reaction with hydrogen using a suitable catalyst.

An alternative method is to produce [¹⁵O]water “in-target” by adding hydrogen to the irradiated target gas at a concentration generally ranging from 2 per cent V/V to 5 per cent V/V.

The [¹⁵O]water vapour contained in the gas-stream is either bubbled through a reservoir of a sterile 9 g/l solution of sodium chloride, or is exchanged by diffusion into such a solution through a membrane filter for dialysis.

Ammonia is a possible chemical impurity in [¹⁵O]water. This may arise either from catalytic conversion of hydrogen and nitrogen on the catalyst or by radiolysis if “in-target” production is used. In addition, there is the possibility of contamination by oxygen-15-labelled oxides of nitrogen. Although these contaminants can be effectively removed from the gas phase by soda lime and charcoal adsorbers, they may break through and be present in the final preparation.

CHARACTERS

A clear, colourless solution.

Oxygen-15 has a half-life of 2.04 min and emits positrons with a maximum energy of 1.732 MeV, followed by annihilation gamma radiation of 0.511 MeV.

IDENTIFICATION

- Record the gamma-ray spectrum using a suitable instrument. The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.
- It complies with the test for radionuclidic purity (see Tests).
- Examine the chromatogram obtained in the test for radiochemical purity. The retention time of the second peak is due to the radioactivity eluting in the void volume.

TESTS

pH (2.2.3). The pH of the injection is 5.5 to 8.5.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

01/2005:0133

Bacterial endotoxins (2.6.14): less than 175/V IU/ml, V being the maximum administered volume in millilitres. The injection may be released for use before completion of the test.

CHEMICAL PURITY

(a) *Ammonium* (2.4.1). 1 ml complies with the limit test for ammonium (10 ppm).

(b) *Nitrates*. To 1 ml add 49 ml of *nitrate-free water R*. Place 5 ml of this solution in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R*, 0.1 ml of *diphenylamine solution R* and, dropwise with shaking, 5 ml of *sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 4.5 ml of *nitrate-free water R* and 0.5 ml of *nitrate standard solution* (2 ppm NO_3) *R* (10 ppm).

The injection may be released for use before completion of tests (a) and (b).

RADIONUCLIDIC PURITY

Record the gamma-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised fluorine-18 solution. Standardised fluorine-18 solutions are available from the laboratories recognised by the competent authority.

The half-life is between 1.9 min and 2.2 min. Not less than 99 per cent of total radioactivity corresponds to oxygen-15.

The injection may be released for use before completion of the test.

RADIOCHEMICAL PURITY

Examine by liquid chromatography (2.2.29).

Test solution. The preparation to be examined.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.0 mm in internal diameter packed with *aminopropylsilyl silica gel for chromatography R* (10 μm),
- as mobile phase at a flow rate of 1 ml/min a 10 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3 with *phosphoric acid R*,
- a suitable radioactivity detector,
- a loop injector,
- an internal recovery detection system, consisting of a loop of the chromatographic tubing between the injector and the column through the radioactivity detector, which has been calibrated for count recovery,

maintaining the column at a constant temperature between 20 °C and 30 °C.

Inject the test solution. Continue the chromatography for 10 min. In the chromatogram obtained, the first peak corresponds to the injected radioactivity of the test solution, the second peak corresponds to the amount of radioactivity as ^{15}O water. Calculate the percentage content of ^{15}O water from the areas of the peaks in the chromatogram obtained with the test solution. Not less than 99 per cent of the total radioactivity injected corresponds to oxygen-15 in the form of water.

The injection may be released for use before completion of the test.

RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by using an instrument calibrated with the aid of such a solution.

XENON (^{133}Xe) INJECTION

Xenoni (^{133}Xe) solutio iniectabilis

DEFINITION

Xenon (^{133}Xe) injection is a sterile solution of xenon-133 that may be made isotonic by the addition of sodium chloride. Xenon-133 is a radioactive isotope of xenon and is obtained by separation from the other products of uranium fission. The injection contains not less than 80 per cent and not more than 130 per cent of the declared xenon-133 radioactivity at the date and hour stated on the label.

The injection is presented in a container that allows the contents to be removed without introducing air bubbles. The container is filled as completely as possible and any gas bubble present does not occupy more than 1 per cent of the volume of the injection as judged by visual comparison with a suitable standard.

CHARACTERS

A clear, colourless solution.

Xenon-133 has a half-life of 5.29 days and emits beta and gamma radiation and X-rays.

IDENTIFICATION

Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised xenon-133 solution in a 9 g/l solution of *sodium chloride R*, apart from any differences attributable to the presence of xenon-131m and xenon-133m. If standardised xenon-133 solutions are not readily available, suitable standardised ionisation chambers are obtainable from laboratories recognised by the relevant competent authority. The most prominent gamma photon of xenon-133 has an energy of 0.081 MeV and there is an X-ray (resulting from internal conversion) of 0.030 MeV to 0.035 MeV. Xenon-131m has a half-life of 11.9 days and emits a gamma photon of 0.164 MeV. Xenon-133m has a half-life of 2.19 days and emits a gamma photon of 0.233 MeV.

TESTS

pH (2.2.3). The pH of the injection is 5.0 to 8.0.

Sterility. It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

RADIONUCLIDIC PURITY

(a) Record the gamma-ray and X-ray spectrum using a suitable instrument. The spectrum does not differ significantly from that of a standardised xenon-133 solution in a 9 g/l solution of *sodium chloride R*, apart from any differences attributable to the presence of xenon-131m and xenon-133m.

(b) Transfer 2 ml of the injection to an open flask and pass a current of air through the solution for 30 min, taking suitable precautions concerning the dispersion of radioactivity. Measure the residual beta and gamma activity of the solution. The activity does not differ significantly from the background activity detected by the instrument.

RADIOACTIVITY

Weigh the container with its contents. Determine its total radioactivity using suitable counting equipment by comparison with a standardised xenon-133 solution or by measurement in an instrument calibrated with the aid of such a solution, operating in strictly identical conditions. If an ionisation chamber is used its inner wall should be such

that the radiation is not seriously attenuated. Remove at least half the contents and re-weigh the container. Measure the radioactivity of the container and the remaining contents as described above. From the measurements, calculate the radioactive concentration of xenon-133 in the injection.

CAUTION

Significant amounts of xenon-133 may be present in the closures and on the walls of the container. This must be taken into account in applying the rules concerning the transport and storage of radioactive substances and in disposing of used containers

01/2005:90004 TESTS

INTRODUCTION

The following monographs apply to sutures for human use: Catgut, sterile (0317), Sutures, sterile non-absorbable (0324), Sutures, sterile synthetic absorbable braided (0667) and Sutures, sterile synthetic absorbable monofilament (0666). They cover performance characteristics of sutures and may include methods of identification. Sutures are medical devices as defined in Directive 93/42/EEC.

These monographs can be applied to show compliance with essential requirements as defined in Article 3 of Directive 93/42/EEC covering the following:

Physical performance characteristics: diameter, breaking load, needle attachment, packaging, sterility, information supplied by the manufacturer (see Section 13 of Annex 1 of Directive 93/42/EEC), labelling.

To show compliance with other essential requirements, the application of appropriate harmonised standards as defined in Article 5 of Directive 93/42/EEC may be considered.

01/2005:0317

CATGUT, STERILE

Chorda resorbilis sterilis

DEFINITION

Sterile catgut consists of sutures prepared from collagen taken from the intestinal membranes of mammals. After cleaning, the membranes are split longitudinally into strips of varying width, which, when assembled in small numbers, according to the diameter required, are twisted under tension, dried, polished, selected and sterilised. The sutures may be treated with chemical substances such as chromium salts to prolong absorption and glycerol to make them supple, provided such substances do not reduce tissue acceptability.

Appropriate harmonised standards may be considered when assessing compliance with respect to origin and processing of raw materials and with respect to biocompatibility.

Sterile catgut is a surgical wound-closure device. Being an absorbable suture it serves to approximate tissue during the healing period and is subsequently metabolised by proteolytic activity.

PRODUCTION

Production complies with relevant regulations on the use of animal tissues in medical devices notably concerning the risk of transmission of animal spongiform encephalopathy agents.

Appropriate harmonised standards may apply with respect to appropriate validated methods of sterilisation, environmental control during manufacturing, labelling and packaging.

It is essential for the effectiveness and the performance characteristics during use and during the functional lifetime of catgut that the following physical properties are specified: consistent diameter, sufficient initial strength and firm needle attachment.

The requirements outlined below have been established, taking into account stresses which occur during normal conditions of use. These requirements can be used to demonstrate that individual production batches of sterile catgut are suitable for wound closure according to usual surgical techniques.

If stored in a preserving liquid, remove the sutures from the sachet and measure promptly and in succession the length, diameter and breaking load. If stored in the dry state, immerse the sutures in alcohol R or a 90 per cent V/V solution of 2-propanol R for 24 h and proceed with the measurements as indicated below.

Length. Measure the length without applying to the suture more tension than is necessary to keep it straight. The length of each suture is not less than 90 per cent of the length stated on the label and does not exceed 350 cm.

Diameter. Carry out the test on 5 sutures. Use a suitable instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10 mm to 15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of 100 ± 10 g to the suture being tested. When making the measurement, lower the pressor foot slowly to avoid crushing the suture. Measure the diameter at intervals of 30 cm over the whole length of the suture. For a suture less than 90 cm in length, measure at 3 points approximately evenly spaced along the suture. The suture is not subjected to more tension than is necessary to keep it straight during measurement. The average of the measurements carried out on the sutures being tested and not less than two-thirds of the measurements taken on each suture are within the limits given in the columns under A in Table 0317-1 for the gauge number concerned. None of the measurements is outside the limits given in the columns under B in Table 0317-1 for the gauge number concerned.

Table 0317-1.— *Diameters and Breaking Loads*

Gauge number	Diameter (millimetres)				Breaking load (newtons)	
	A		B		C	D

Minimum breaking load. The minimum breaking load is determined over a simple knot formed by placing one end of a suture held in the right hand over the other end held in the left hand, passing one end over the suture and through the loop so formed (see Figure 0317-1) and pulling the knot tight. Carry out the test on 5 sutures. Submit sutures of length greater than 75 cm to 2 measurements and shorter

sutures to one measurement. Determine the breaking load using a suitable tensiometer. The apparatus has 2 clamps for holding the suture, one of which is mobile and is driven at a constant rate of 30 cm/min. The clamps are designed so that the suture being tested can be attached without any possibility of slipping. At the beginning of the test the length of suture between the clamps is 12.5 cm to 20 cm and the knot is midway between the clamps. Set the mobile clamp in motion and note the force required to break the suture. If the suture breaks in a clamp or within 1 cm of it, the result is discarded and the test repeated on another suture. The average of all the results, excluding those legitimately discarded, is equal to or greater than the value given in column C in Table 0317-1 and no individual result is less than that given in column D for the gauge number concerned.

Figure 0317-1. – Simple knot

Soluble chromium compounds. Place 0.25 g in a conical flask containing 1 ml of *water R* per 10 mg of catgut. Stopper the flask, allow to stand at 37 ± 0.5 °C for 24 h, cool and decant the liquid. Transfer 5 ml to a small test tube and add 2 ml of a 10 g/l solution of *diphenylcarbazide R* in *alcohol R* and 2 ml of *dilute sulphuric acid R*. The solution is not more intensely coloured than a standard prepared at the same time using 5 ml of a solution containing 2.83 µg of *potassium dichromate R* per millilitre, 2 ml of *dilute sulphuric acid R* and 2 ml of a 10 g/l solution of *diphenylcarbazide R* in *alcohol R* (1 ppm of Cr).

Needle attachment. If the catgut is supplied with an eyeless needle attached that is not stated to be detachable, it complies with the test for needle attachment. Carry out the test on 5 sutures. Use a suitable tensiometer, such as that described for the determination of the minimum breaking load. Fix the needle and suture (without knot) in the clamps of the apparatus in such a way that the swaged part of the needle is completely free of the clamp and in line with the direction of pull on the suture. Set the mobile clamp in motion and note the force required to break the suture or to detach it from the needle. The average of the 5 determinations and all individual values are not less than the respective values given in Table 0317-2 for the gauge number concerned. If not more than one individual value fails to meet the individual requirement, repeat the test on an additional 10 sutures. The catgut complies with the test if none of these 10 values is less than the individual value in Table 0317-2 for the gauge number concerned.

STORAGE (PACKAGING)

Sterile catgut sutures are presented in individual sachets that maintain sterility and allow the withdrawal and use of the sutures in aseptic conditions. Sterile catgut may be stored dry or in a preserving liquid to which an antimicrobial agent but not an antibiotic may be added.

Sutures in their individual sachets (primary packaging) are kept in a protective cover (box) which maintains the physical and mechanical properties until the time of use.

The application of appropriate harmonised standards for packaging of medical devices shall be considered.

Table 0317-2. – Minimum Strengths of Needle Attachment

Gauge number	Mean value (newtons)	Individual values (newtons)
0.5	0.50	0.25
0.7	0.80	0.40
1	1.7	0.80
1.5	2.3	1.1
2	4.5	2.3
2.5	5.6	2.8
3	6.8	3.4
3.5	11.0	4.5
4	15.0	4.5
5	18.0	6.0

LABELLING

Reference may be made to the appropriate harmonised standards for labelling of medical devices.

The details strictly necessary for the user to identify the product properly are indicated on or in each sachet (primary packaging) and on the protective cover (box) and include at least:

- gauge number,
- length in centimetres or metres,
- if appropriate, that the needle is detachable,
- name of the product,
- intended use (surgical suture, absorbable).

01/2005:0324

SUTURES, STERILE NON-ABSORBABLE

Fila non resorbilia sterilia

DEFINITION

Sterile non-absorbable sutures are sutures which, when introduced into a living organism, are not metabolised by that organism. Sterile non-absorbable sutures vary in origin, which may be animal, vegetable, metallic or synthetic. They occur as cylindrical monofilaments or as multifilament sutures consisting of elementary fibres which are assembled by twisting, cabling or braiding; they may be sheathed; they may be treated to render them non-capillary, and they may be coloured.

Appropriate harmonised standards may be considered when assessing compliance with respect to origin and processing of raw materials and with respect to biocompatibility.

Sterile non-absorbable surgical sutures serve to approximate tissue during the healing period and provide continuing wound support.

Commonly used materials include the following:

Silk (*Filum bombycis*)

Sterile braided silk suture is obtained by braiding a number of threads, according to the diameter required, of degummed silk obtained from the cocoons of the silkworm *Bombyx mori* L.

Linen (Filum lini)

Sterile linen thread consists of the pericyclic fibres of the stem of *Linum usitatissimum* L. The elementary fibres, 2.5 cm to 5 cm long, are assembled in bundles 30 cm to 80 cm long and spun into continuous lengths of suitable diameter.

Poly(ethylene terephthalate) (Filum ethyleni polyterephthalici)

Sterile poly(ethylene terephthalate) suture is obtained by drawing poly(ethylene terephthalate) through a suitable die. The suture is prepared by braiding very fine filaments in suitable numbers, depending on the gauge required.

Polyamide-6 (Filum polyamidicum-6)

Sterile polyamide-6 suture is obtained by drawing through a suitable die a synthetic plastic material formed by the polymerisation of ϵ -caprolactam. It consists of smooth, cylindrical monofilaments or braided filaments, or lightly twisted sutures sheathed with the same material.

Polyamide-6/6 (Filum polyamidicum-6/6)

Sterile polyamide-6/6 suture is obtained by drawing through a suitable die a synthetic plastic material formed by the polycondensation of hexamethylenediamine and adipic acid. It consists of smooth, cylindrical monofilaments or braided filaments, or lightly twisted sutures sheathed with the same material.

Polypropylene (Filum polypropylenicum)

Polypropylene suture is obtained by drawing polypropylene through a suitable die. It consists of smooth cylindrical mono-filaments.

Monofilament and multifilament stainless steel (Filum aciei irrubiginibilis monofilamentum/multifilamentum)

Sterile stainless steel sutures have a chemical composition as specified in ISO 5832-1 - Metallic Materials for surgical implants - Part 1: Specification for wrought stainless steel and comply with ISO 10334 - Implants for surgery - Malleable wires for use as sutures and other surgical applications.

Stainless steel sutures consist of smooth, cylindrical monofilaments or twisted filaments or braided filaments.

Poly(vinylidene difluoride) (PVDF) (Filum poly(vinylideni difluoridum))

Sterile PVDF suture is obtained by drawing through a suitable die a synthetic plastic material which is formed by polymerisation of 1,1-difluoroethylene. It consists of smooth cylindrical monofilaments.

IDENTIFICATION

Non-absorbable sutures may be identified by chemical tests. Materials from natural origin may also be identified by microscopic examination of the morphology of these fibres. For synthetic materials, identification by infrared spectrophotometry (2.2.24) or by differential scanning calorimetry may be applied.

Identification of silk

- A. Dissect the end of a suture, using a needle or fine tweezers, to isolate a few individual fibres. The fibres are sometimes marked with very fine longitudinal striations parallel to the axis of the suture. Examined under a microscope, a cross-section is more or less triangular to semi-circular, with rounded edges and without a lumen.
- B. Impregnate isolated fibres with *iodinated potassium iodide solution R*. The fibres are coloured pale yellow.

Identification of linen

- A. Dissect the end of a suture, using a needle or fine tweezers, to isolate a few individual fibres. Examined under a microscope, the fibres are seen to be 12 μ m

to 31 μ m wide and, along the greater part of their length, have thick walls, sometimes marked with fine longitudinal striations, and a narrow lumen. The fibres gradually narrow to a long, fine point. Sometimes there are unilateral swellings with transverse lines.

- B. Impregnate isolated fibres with *iodinated zinc chloride solution R*. The fibres are coloured violet-blue.

Identification of poly(ethyleneterephthalate)

It is practically insoluble in most of the usual organic solvents, but is attacked by strong alkaline solutions. It is incompatible with phenols.

- A. 50 mg dissolves with difficulty when heated in 50 ml of *dimethylformamide R*.
- B. To about 50 mg add 10 ml of *hydrochloric acid R1*. The material remains intact even after immersion for 6 h.

Identification of polyamide-6

It is practically insoluble in the usual organic solvents; it is not attacked by dilute alkaline solutions (for example a 100 g/l solution of *sodium hydroxide R*) but is attacked by dilute mineral acids (for example a 20 g/l solution of *sulphuric acid R*), by hot *glacial acetic acid R* and by a 70 per cent *m/m* solution of *anhydrous formic acid R*.

- A. Heat about 50 mg with 0.5 ml of *hydrochloric acid R1* in a sealed glass tube at 110 °C for 18 h and allow to stand for 6 h. No crystals appear.
- B. 50 mg dissolves in 20 ml of a 70 per cent *m/m* solution of *anhydrous formic acid R*.

Identification of polyamide-6/6

It is practically insoluble in the usual organic solvents; it is not attacked by dilute alkaline solutions (for example a 100 g/l solution of *sodium hydroxide R*) but is attacked by dilute mineral acids (for example a 20 g/l solution of *sulphuric acid R*), by hot *glacial acetic acid R* and by an 80 per cent *m/m* solution of *anhydrous formic acid R*.

- A. In contact with a flame it melts and burns, forming a hard globule of residue and gives off a characteristic odour resembling that of celery.
- B. Place about 50 mg in an ignition tube held vertically and heat gently until thick fumes are evolved. When the fumes fill the tube, withdraw it from the flame and insert a strip of *nitrobenzaldehyde paper R*. A violet-brown colour slowly appears on the paper and fades slowly in air; it disappears almost immediately on washing with *dilute sulphuric acid R*.
- C. To about 50 mg add 10 ml of *hydrochloric acid R1*. The material disintegrates in the cold and dissolves within a few minutes.
- D. 50 mg does not dissolve in 20 ml of a 70 per cent *m/m* solution of *anhydrous formic acid R* but dissolves in 20 ml of an 80 per cent *m/m* solution of *anhydrous formic acid R*.

Identification of polypropylene

Polypropylene is soluble in decahydronaphthalene, 1-chloronaphthalene and trichloroethylene. It is not soluble in alcohol, in ether and in cyclohexanone.

- A. It softens at temperatures between 160 °C and 170 °C. It burns with a blue flame giving off an odour of burning paraffin wax and of octyl alcohol.
- B. To 0.25 g add 10 ml of *toluene R* and boil under a reflux condenser for about 15 min. Place a few drops of the solution on a disc of *sodium chloride R* slide and evaporate the solvent in an oven at 80 °C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *polypropylene CRS*.

- C. To 2 g add 100 ml of *water R* and boil under a reflux condenser for 2 h. Allow to cool. The relative density (2.2.5) of the material is 0.89 g/ml to 0.91 g/ml, determined using a hydrostatic balance.

Identification of stainless steel

Stainless steel sutures are identified by confirming that the composition is in accordance with ISO 5832 Part 1.

Identification of poly(vinylidene difluoride)

It is soluble in warm dimethylformamide. It is insoluble in ethanol, hot and cold isopropyl alcohol, ethyl acetate, tetrachlorethylene.

- A. The strand melts between 170 °C and 180 °C. It melts in a flame and does not burn after removal of the flame. Place a small piece of suture on an annealed copper wire or sheet. Heat in an oxidising flame. No green colour is produced.
- B. Dissolve 0.25 g of the suture in 10 ml of *dimethylformamide R* and boil under a reflux condenser for about 15 min. Place a few drops of the solution on a *sodium chloride R* slide and evaporate the solvent in an oven at 80 °C (1 h). Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of poly(vinylidene difluoride)*.
- C. To 2 g of suture add 100 ml of *water R* and boil under a reflux condenser for 2 h. Allow to cool. The relative density (2.2.5) of the material is 1.71 to 1.78.

PRODUCTION

The appropriate harmonised standards may apply with respect to appropriate validated methods of sterilisation, environmental control during manufacturing, labelling and packaging.

It is essential for the effectiveness and the performance characteristics during use and during the functional lifetime of these sutures that the following physical properties are specified: consistent diameter, sufficient initial strength and firm needle attachment.

The requirements below have been established, taking into account stresses which occur during normal conditions of use. These requirements can be used to demonstrate that individual production batches of these sutures are suitable for wound closure in accordance with usual surgical techniques.

TESTS

Remove the sutures from the sachet and measure promptly and in succession the length, diameter and minimum load.

If linen is tested the sutures are conditioned as follows: if stored in the dry state, expose to an atmosphere with a relative humidity of 65 ± 5 per cent at 20 ± 2 °C for 4 h immediately before measuring the diameter and for the determination of minimum breaking load immerse in *water R* at room temperature for 30 min immediately before carrying out the test.

Length. Measure the length without applying more tension than is necessary to keep them straight. The length of the suture is not less than 95 per cent of the length stated on the label and does not exceed 400 cm.

Diameter. Unless otherwise prescribed, measure the diameter by the following method using 5 sutures. Use a suitable mechanical instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10-15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of 100 ± 10 g to the suture being tested. When

making the measurements, lower the pressor foot slowly to avoid crushing the suture. Measure the diameter at intervals of 30 cm over the whole length of the suture. For a suture less than 90 cm in length, measure at 3 points approximately evenly spaced along the suture. During the measurement submit monofilament sutures to a tension not greater than that required to keep them straight. Submit multifilament sutures to a tension not greater than one-fifth of the minimum breaking load shown in column C of Table 0324.-1 appropriate to the gauge number and type of material concerned or 10 N whichever is less. Stainless steel sutures do not require tension to be applied during the measurement of diameter. For multifilament sutures of gauge number above 1.5 make 2 measurements at each point, the second measurement being made after rotating the suture through 90°. The diameter of that point is the average of the 2 measurements. The average of the measurements carried out on the sutures being tested and not less than two-thirds of the measurements taken on each suture are within the limits given in the column under A in Table 0324.-1 for the gauge number concerned. None of the measurements are outside the limits given in the columns under B in Table 0324.-1 for the gauge number concerned.

Minimum breaking load. Unless otherwise prescribed, determine the minimum breaking load by the following method using sutures in the condition in which they are presented. The minimum breaking load is determined over a simple knot formed by placing one end of a suture held in the right hand over the other end held in the left hand, passing one end over the suture and through the loop so formed (see Figure 0324.-1) and pulling the knot tight. For stainless steel sutures gauges 3.5 and above, the minimum breaking load is determined on a straight pull. Carry out the test on 5 sutures. Submit sutures of length greater than 75 cm to 2 measurements and shorter sutures to 1 measurement. Determine the breaking load using a suitable tensiometer. The apparatus has 2 clamps for holding the suture, 1 of which is mobile and is driven at a constant rate of 30 cm/min. The clamps are designed so that the suture being tested can be attached without any possibility of slipping. At the beginning of the test the length of suture between the clamps is 12.5 cm to 20 cm and the knot is midway between the clamps. Set the mobile clamp in motion and note the force required to break the suture. If the suture breaks in a clamp or within 1 cm of it, the result is discarded and the test repeated on another suture. The average of all the results, excluding those legitimately discarded, is equal to or greater than the value given in column C in Table 0324.-1 and no value is less than that given in column D for the gauge number and type of material concerned.

Figure 0324.-1. – Simple knot

Needle attachment. If the sutures are supplied with an eyeless needle attached that is not stated to be detachable, they comply with the test for needle attachment. Carry out

Table 0324.-1. – *Diameters and minimum breaking loads*

Gauge number	Diameter (millimetres)				Minimum breaking load (newtons)

9	0.900	0.999	0.850	1.050					156.0	117.0
10	1.000	1.099	0.950	1.150					178.5	133.9

the test on 5 sutures. Use a suitable tensiometer, such as that described for the determination of the minimum breaking load. Fix the needle and suture (without knot) in the clamps of the apparatus in such a way that the swaged part of the needle is completely free of the clamp and in line with the direction of pull on the suture. Set the mobile clamp in motion and note the force required to break the suture or to detach it from the needle. The average of the 5 determinations and all individual values are not less than the respective values given in Table 0324.-2 for the gauge number concerned. If not more than 1 individual value fails to meet the individual requirement, repeat the test on an additional 10 sutures. The attachment complies with the test if none of these 10 values is less than the individual value in Table 0324.-2 for the gauge number concerned.

Extractable colour. Sutures that are dyed and intended to remain so during use comply with the test for extractable colour. Place 0.25 g of the suture to be examined in a conical flask, add 25.0 ml of *water R* and cover the mouth of the flask with a short-stemmed funnel. Boil for 15 min, cool and adjust to the original volume with *water R*. Depending on the colour of the suture, prepare the appropriate reference solution as described in Table 0324.-3 using the primary colour solutions (2.2.2).

The test solution is not more intensely coloured than the appropriate reference solution.

Table 0324.-2. – *Minimum strengths of needle attachment*

Gauge number	Mean value (newtons)	Individual value (newtons)
0.4	0.50	0.25
0.5	0.80	0.40
0.7	1.7	0.80
1	2.3	1.1
1.5	4.5	2.3
2	6.8	3.4
2.5	9.0	4.5

7	25.0	12.5
8	50.0	25
9	50.0	25
10	75.0	37.5

Table 0324.-3. – *Colour reference solutions*

Colour of strand	Composition of reference solution (parts by volume)			<i>Water R</i>
	Red primary solution	Yellow primary solution	Blue primary solution	
Yellow-brown	0.2	1.2	-	8.6
Pink-red	1.0	-	-	9.0
Green-blue	-	-	2.0	8.0
Violet	1.6	-	8.4	-

Monomer and oligomers. Polyamide-6 suture additionally complies with the following test for monomer and oligomers. In a continuous-extraction apparatus, treat 1.00 g with 30 ml of *methanol R* at a rate of at least 3 extractions per hour for 7 h. Evaporate the extract to dryness, dry the residue at 110 °C for 10 min, allow to cool in a desiccator and weigh. The residue weighs not more than 20 mg (2 per cent).

STORAGE (PACKAGING)

Sterile non-absorbable sutures are presented in a suitable sachet that maintains sterility and allows the withdrawal and use of a suture in aseptic conditions. They may be stored dry or in a preserving liquid to which an antimicrobial agent but no antibiotic may be added.

Sterile non-absorbable sutures are intended to be used only on the occasion when the sachet is first opened.

Sutures in their individual sachets (primary packaging) are kept in a protective cover (box) which maintains the physical and mechanical properties until the time of use.

The application of appropriate harmonised standards for packaging of medical devices shall be considered in addition.

LABELLING

Reference may be made to the appropriate harmonised standards for the labelling of medical devices.

The details strictly necessary for the user to identify the product properly are indicated on or in each sachet (primary packaging) and on the protective cover (box) and include at least:

- gauge number,
- length, in centimetres or metres,
- if appropriate, that the needle is detachable,
- name of the product,
- intended use (surgical suture, non-absorbable),
- if appropriate, that the suture is coloured,
- if appropriate, the structure (braided, monofilament, sheathed).

01/2005:0667

SUTURES, STERILE SYNTHETIC ABSORBABLE BRAIDED

Fila resorbilia synthetica torta sterilia

DEFINITION

Sterile synthetic absorbable braided sutures consist of sutures prepared from a synthetic polymer, polymers or copolymers which, when introduced into a living organism,

are absorbed by that organism and cause no undue tissue irritation. They consist of completely polymerised material. They occur as multifilament sutures consisting of elementary fibres which are assembled by braiding. The sutures may be treated to facilitate handling and they may be coloured.

Appropriate harmonised standards may be considered when assessing compliance with respect to origin and processing of raw materials and with respect to biocompatibility.

Sterile synthetic absorbable braided sutures are wound-closure devices. Being absorbable they serve to approximate tissue during the healing period and subsequently lose tensile strength by hydrolysis.

PRODUCTION

Appropriate harmonised standards may apply with respect to appropriate validated methods of sterilisation, environmental control during manufacturing, labelling and packaging.

It is essential for the effectiveness and the performance characteristics during use and during the functional lifetime of these sutures that the following physical properties are specified: consistent diameter, sufficient initial strength and firm needle attachment.

The requirements below have been established, taking into account stresses which occur during normal conditions of use. These requirements can be used to demonstrate that individual production batches of these sutures are suitable for wound closure according to usual surgical techniques.

TESTS

Carry out the following tests on the sutures in the state in which they are removed from the sachet.

Length. Measure the length of the suture without applying more tension than is necessary to keep it straight. The length of each suture is not less than 95 per cent of the length stated on the label and does not exceed 400 cm.

Diameter. Unless otherwise prescribed, measure the diameter by the following method, using five sutures in the condition in which they are presented. Use a suitable instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10 mm to 15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of 100 ± 10 g to the suture being tested. When making the measurements, lower the pressor foot slowly to avoid crushing the suture. Measure the diameter at intervals of 30 cm over the whole length of the suture. For a suture less than 90 cm in length, measure at three points approximately evenly spaced along the suture. During the measurement, submit the sutures to a tension not greater than one-fifth of the minimum breaking load shown in column C of Table 0667.-1 appropriate to the gauge number and type of material or 10 N whichever is less. For sutures of gauge number above 1.5 make two measurements at each point, the second measurement being made after rotating the suture through 90°. The diameter of that point is the average of the two measurements. The average of the measurements carried out on the sutures being tested and not less than two-thirds of the measurements taken on each suture are within the limits given in the columns under A in Table 0667.-1 for the gauge

number concerned. None of the measurements is outside the limits given in the columns under B in Table 0667-1 for the gauge number concerned.

Table 0667-1. – *Diameters and breaking loads*

Gauge number	Diameter (millimetres)				Breaking load (newtons)	
	A		B		C	D

2	0.200	0.249	0.175	0.275	17.7	8.9
2.5	0.250	0.299	0.225	0.325	21.0	10.5
3	0.300	0.349	0.275	0.375	26.8	13.4
3.5	0.350	0.399	0.325	0.450	39.0	18.5
4	0.400	0.499	0.375	0.550	50.8	25.4
5	0.500	0.599	0.450	0.650	63.5	31.8
6	0.600	0.699	0.550	0.750	-	-
7	0.700	0.799	0.650	0.850	-	-

Minimum breaking load. The minimum breaking load is determined over a simple knot formed by placing one end of a suture held in the right hand over the other end held in the left hand, passing one end over the suture and through the loop so formed (see Figure 0667-1) and pulling the knot tight.

Figure 0667-1. – *Simple knot*

Carry out the test on five sutures. Submit sutures of length greater than 75 cm to two measurements and shorter sutures to one measurement. Determine the breaking load using a suitable tensiometer. The apparatus has two clamps for holding the suture, one of which is mobile and is driven at a constant rate of 25 cm to 30 cm per minute. The clamps are designed so that the suture being tested can be attached without any possibility of slipping. At the beginning of the test the length of suture between the clamps is 12.5 cm to 20 cm and the knot is midway between the clamps. Set the mobile clamp in motion and note the force required to break the suture. If the suture breaks in a clamp or within

1 cm of it, the result is discarded and the test repeated on another suture. The average of all the results excluding those legitimately discarded is equal to or greater than the value given in column C in Table 0667-1 and no individual result is less than that given in column D for the gauge number concerned.

Needle attachment. If the suture is supplied with an eyeless needle attached that is not stated to be detachable the attachment, it complies with the test for needle attachment. Carry out the test on five sutures. Use a suitable tensiometer, such as that described for the determination of the minimum breaking load. Fix the needle and suture (without knot) in the clamps of the apparatus in such a way that the swaged part of the needle is completely free of the clamp and in line with the direction of pull on the suture. Set the mobile clamp in motion and note the force required to break the suture or to detach it from the needle. The average of the five determinations and all individual values are not less than the respective values given in Table 0667-2 for the gauge number concerned. If not more than one individual value fails to meet the individual requirement, repeat the test on an additional ten sutures. The attachment complies with the test if none of the ten values is less than the individual value in Table 0667-2 for the gauge number concerned.

Table 0667-2. – *Minimum strengths of needle attachment*

Gauge number	Mean value (newtons)	Individual value (newtons)
0.4	0.50	0.25
0.5	0.80	0.40
0.7	1.7	0.80
1	2.3	1.1
1.5	4.5	2.3
2	6.8	3.4
2.5	9.0	4.5
3	11.0	4.5
3.5	15.0	4.5
4	18.0	6.0
5	18.0	7.0

STORAGE (PACKAGING)

Sterile synthetic absorbable braided sutures are presented in a suitable sachet that maintains sterility and allows the withdrawal and use of the sutures in aseptic conditions. The sutures must be stored dry.

They are intended to be used only on the occasion when the sachet is first opened.

Sutures in their individual sachets (primary packaging) are kept in a protective cover (box) which maintains the physical and mechanical properties until the time of use.

The application of appropriate harmonised standards for packaging of medical devices may be considered in addition.

LABELLING

Reference may be made to the appropriate harmonised standards for the labelling of medical devices.

The details strictly necessary for the user to identify the product properly are indicated on or in each sachet (primary packaging) and on the protective cover (box) and include at least:

- gauge number,
- length in centimetres or metres,
- if appropriate, that the needle is detachable,

- name of the product,
- intended use (surgical absorbable suture),
- if appropriate, that the suture is coloured,
- the structure (braided).

01/2005:0666

SUTURES, STERILE SYNTHETIC ABSORBABLE MONOFILAMENT

Fila resorbilia synthetica monofilamenta sterilia

DEFINITION

Sterile synthetic absorbable monofilament sutures consist of sutures prepared from a synthetic polymer, polymers or copolymers which, when introduced into a living organism, are absorbed by that organism and cause no undue tissue irritation. They consist of completely polymerised material. They occur as monofilament sutures. The sutures may be treated to facilitate handling and they may be coloured.

Appropriate harmonised standards may be considered when assessing compliance with respect to origin and processing of raw materials and with respect to biocompatibility.

Sterile synthetic absorbable monofilament sutures are wound-closure devices. Being absorbable they serve to approximate tissue during the healing period and subsequently lose tensile strength by hydrolysis.

PRODUCTION

The appropriate harmonised standards may apply with respect to appropriate validated methods of sterilisation, environmental control during manufacturing, labelling and packaging.

It is essential for the effectiveness and the performance characteristics during use and during the functional lifetime of these sutures that the following physical properties are specified: consistent diameter, sufficient initial strength and firm needle attachment.

The requirements below have been established, taking into account stresses which occur during normal conditions of use. These requirements can be used to demonstrate that individual production batches of these sutures are suitable for wound closure according to usual surgical techniques.

TESTS

Carry out the following tests on the sutures in the state in which they are removed from the sachet.

Length. Measure the length of the suture without applying more tension than is necessary to keep it straight. The length of each suture is not less than 95 per cent of the length stated on the label and does not exceed 400 cm.

Diameter. Unless otherwise prescribed, measure the diameter by the following method, using five sutures in the condition in which they are presented. Use a suitable instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10 mm to 15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of 100 ± 10 g to the suture being tested. When making the measurements, lower the pressor foot slowly to avoid crushing the suture. Measure the diameter at intervals of 30 cm over the whole length of the suture. For a suture less than 90 cm in length, measure at three points approximately evenly spaced along

the suture. During the measurement, submit the sutures to a tension not greater than that required to keep them straight. The average of the measurements carried out on the sutures being tested and not less than two-thirds of the measurements taken on each suture are within the limits given in the columns under A in Table 0666.-1 for the gauge number concerned. None of the measurements is outside the limits given in the columns under B in Table 0666.-1 for the gauge number concerned.

Table 0666.-1. – *Diameters and breaking loads*

Gauge number	Diameter (millimetres)				Breaking load (newtons)	
	A		B		C	D
	min.	max.	min.	max.

CATGUT, STERILE, IN DISTRIBUTOR
FOR VETERINARY USE

Chorda resorbilis sterilis in fuso
ad usum veterinarium

DEFINITION

Sterile catgut in distributor for veterinary use consists of strands prepared from collagen taken from the intestinal membranes of mammals. After cleaning, the membranes are split longitudinally into strips of varying width, which, when assembled in small numbers, according to the diameter required, are twisted under tension, dried, polished, selected and sterilised. The strands may be treated with chemical substances such as chromium salts to prolong absorption and glycerol to make them supple, provided such substances do not reduce tissue acceptability.

The strand is presented in a distributor that allows the withdrawal and use of all or part of it in aseptic conditions. The design of the distributor is such that with suitable handling the sterility of the content is maintained even when part of the strand has been withdrawn. It may be stored dry or in a preserving liquid to which an antimicrobial preservative but not an antibiotic may be added.

TESTS

If stored in a preserving liquid, remove the strand from the distributor and measure promptly and in succession the length, diameter and breaking load. If stored in the dry state, immerse the strand in alcohol R or a 90 per cent V/V solution of 2-propanol R for 24 h and proceed with the measurements as indicated above.

Length. Measure the length without applying to the strand more tension than is necessary to keep it straight. The length is not less than 95 per cent of the length stated on the label. If the strand consists of several sections joined by knots, the length of each section is not less than 2.5 m.

Diameter. Carry out the test using a suitable instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10 mm to 15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of 100 ± 10 g to the strand being tested. When making the measurements, lower the pressor foot slowly to avoid crushing the strand. Make not fewer than one measurement per 2 m of length. If the strand consists of several sections joined by knots, make not fewer than three measurements per section. In any case make not fewer than twelve measurements. Make the measurements at points evenly spaced along the strand or along each section. The strand is not subjected to more tension than is necessary to keep it straight during measurement. The average of the measurements carried out on the strand being tested and not less than two-thirds of the individual measurements are within the limits given in the column under A in Table 0660.-1 for the gauge number

Table 0660.-1. – *Diameters and breaking loads*

Gauge number	Diameter (millimetres)				Breaking load (newtons)	
	A		B		C	D
	min.	max.	min.	max.		
1	0.100	0.149	0.085	0.175	1.8	0.4
1.5	0.150	0.199	0.125	0.225	3.8	0.7
2	0.200	0.249	0.175	0.275	7.5	1.8
2.5	0.250	0.299	0.225	0.325	10	3.8
3	0.300	0.349	0.275	0.375	12.5	7.5
3.5	0.350	0.399	0.325	0.450	20	10
4	0.400	0.499	0.375	0.550	27.5	12.5
5	0.500	0.599	0.450	0.650	38.4	20.0
6	0.600	0.699	0.550	0.750	45.0	27.5
7	0.700	0.799	0.650	0.850	60.0	38.0
8	0.800	0.899	0.750	0.950	70.0	45.0

Minimum breaking load. The minimum breaking load is determined over a simple knot formed by placing one end of a strand held in the right hand over the other end held in the left hand, passing one end over the strand and through the loop so formed (see Figure 0660.-1) and pulling the knot tight.

Figure 0660.-1. – *Simple knot*

Make not fewer than one measurement per 2 m of length. If the strand consists of several sections joined by knots, make not fewer than three measurements per section and, in any case, not fewer than one measurement per 2 m of length at points evenly spaced along the strand or along each section. Determine the breaking load using a suitable tensiometer. The apparatus has two clamps for holding the strand, one of which is mobile and is driven at a constant rate of 30 cm per minute. The clamps are designed so that the strand being tested can be attached without any possibility of slipping. At the beginning of the test the length of strand between the clamps is 12.5 cm to 20 cm and the knot is midway between the clamps. Set the mobile clamp in motion and note the force required to break the strand. If the strand breaks in a clamp or within 1 cm of it, the result is discarded and the test repeated on another part of the strand. The average of all the results, excluding those legitimately discarded, is equal to or greater than the value in column C and no value is less than that given in column D in Table 0660.-1 for the gauge number concerned.

Soluble chromium compounds. Place 0.25 g in a conical flask containing 1 ml of *water R* per 10 mg of catgut. Stopper the flask, allow to stand at 37 ± 0.5 °C for 24 h, cool and decant the liquid. Transfer 5 ml to a small test tube and add 2 ml of a 10 g/l solution of *diphenylcarbazide R* in *alcohol R* and 2 ml of *dilute sulphuric acid R*. The solution is not more intensely coloured than a standard prepared at the same time using 5 ml of a solution containing 2.83 µg of *potassium dichromate R* per millilitre, 2 ml of *dilute sulphuric acid R* and 2 ml of a 10 g/l solution of *diphenylcarbazide R* in *alcohol R* (1 ppm of Cr).

Sterility (2.6.1). It complies with the test for sterility as applied to catgut and other surgical sutures. Carry out the test on three sections, each 30 cm long, cut off respectively from the beginning, the centre and the end of the strand.

STORAGE

Store protected from light and heat.

LABELLING

The label states:

- the gauge number,
- the length in centimetres or in metres.

01/2005:0608

LINEN THREAD, STERILE, IN DISTRIBUTOR FOR VETERINARY USE

Filum lini sterile in fuso
ad usum veterinarium

DEFINITION

Sterile linen thread in distributor for veterinary use consists of the pericyclic fibres of the stem of *Linum usitatissimum* L. The elementary fibres, 2.5 cm to 5 cm long, are assembled in bundles 30 cm to 80 cm long and spun into continuous lengths of suitable diameter. The thread may be creamy-white or may be coloured with colouring matter authorised by the competent authority. The thread is sterilised.

IDENTIFICATION

- A. Dissect the end of a thread, using a needle or fine tweezers, to isolate a few individual fibres. Examined under a microscope, the fibres are seen to be 12 µm to 31 µm wide and, along the greater part of their length, have thick walls, sometimes marked with fine longitudinal striations, and a narrow lumen. The fibres gradually narrow to a long, fine point. Sometimes there are unilateral swellings with transverse lines.
- B. Impregnate isolated fibres with *iodinated zinc chloride solution R*. The fibres are coloured violet-blue.

TESTS

It complies with the tests prescribed in the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

If stored in a dry state, expose to an atmosphere with a relative humidity of 65 ± 5 per cent at 20 ± 2 °C for 4 h immediately before measuring the diameter and for the determination of minimum breaking load immerse in water R at room temperature for 30 min immediately before carrying out the test.

STORAGE

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

LABELLING

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

01/2005:0609

POLYAMIDE 6 SUTURE, STERILE, IN DISTRIBUTOR FOR VETERINARY USE

Filum polyamidicum-6 sterile in fuso
ad usum veterinarium

DEFINITION

Sterile polyamide 6 suture in distributor for veterinary use is obtained by drawing through a suitable die a synthetic plastic material formed by the polymerisation of ε-caprolactam. It consists of smooth, cylindrical monofilaments or braided filaments, or lightly twisted strands sheathed with the same material. It may be coloured with colouring matter authorised by the competent authority. The suture is sterilised.

CHARACTERS

It is practically insoluble in the usual organic solvents; it is not attacked by dilute alkaline solutions (for example a 100 g/l solution of sodium hydroxide) but is attacked by dilute mineral acids (for example 20 g/l sulphuric acid), by hot glacial acetic acid and by 70 per cent *m/m* formic acid.

IDENTIFICATION

- A. Heat about 50 mg with 0.5 ml of *hydrochloric acid R1* in a sealed glass tube at 110 °C for 18 h and allow to stand for 6 h. No crystals appear.
- B. To about 50 mg add 10 ml of *hydrochloric acid R1*. The material disintegrates in the cold and dissolves completely within a few minutes.
- C. It dissolves in a 70 per cent *m/m* solution of *anhydrous formic acid R*.

TESTS

It complies with the tests prescribed in the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)* and with the following test:

Monomer and oligomers. In a continuous-extraction apparatus, treat 1.00 g with 30 ml of *methanol R* at a rate of at least three extractions per hour for 7 h. Evaporate the extract to dryness, dry the residue at 110 °C for 10 min, allow to cool in a desiccator and weigh. The residue weighs not more than 20 mg (2 per cent).

STORAGE

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

LABELLING

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

The label states whether the suture is braided, monofilament or sheathed.

01/2005:0610

01/2005:0607

POLYAMIDE 6/6 SUTURE, STERILE, IN DISTRIBUTOR FOR VETERINARY USE

Filum polyamidicum-6/6 sterile in fuso ad usum veterinarium

DEFINITION

Sterile polyamide 6/6 suture in distributor for veterinary use is obtained by drawing through a suitable die a synthetic plastic material formed by the polycondensation of hexamethylene-diamine and adipic acid. It consists of smooth, cylindrical monofilaments or braided filaments, or lightly twisted strands sheathed with the same material. It may be coloured with authorised colouring matter or pigments authorised by the competent authority. The suture is sterilised.

CHARACTERS

It is practically insoluble in the usual organic solvents; it is not attacked by dilute alkaline solutions (for example a 100 g/l solution of sodium hydroxide) but is attacked by dilute mineral acids (for example 20 g/l sulphuric acid), by hot glacial acetic acid and by 80 per cent *m/m* formic acid.

IDENTIFICATION

- A. In contact with a flame it melts and burns, forming a hard globule of residue and gives off a characteristic odour resembling that of celery.
- B. Place about 50 mg in an ignition tube held vertically and heat gently until thick fumes are evolved. When the fumes fill the tube, withdraw it from the flame and insert a strip of *nitrobenzaldehyde paper R*. A violet-brown colour slowly appears on the paper and fades slowly in air; it disappears immediately on washing with *dilute sulphuric acid R*.
- C. To about 50 mg add 10 ml of *hydrochloric acid R1*. The material disintegrates in the cold and dissolves within a few minutes.
- D. It does not dissolve in a 70 per cent *m/m* solution of *anhydrous formic acid R* but dissolves in an 80 per cent *m/m* solution of *anhydrous formic acid R*.

TESTS

It complies with the tests prescribed in the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

STORAGE

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

LABELLING

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

The label states whether the suture is braided, monofilament or sheathed.

POLY(ETHYLENE TEREPHTHALATE) SUTURE, STERILE, IN DISTRIBUTOR FOR VETERINARY USE

Filum ethyleni polyterephthalici sterile in fuso ad usum veterinarium

DEFINITION

Sterile poly(ethylene terephthalate) suture in distributor for veterinary use is obtained by drawing poly(ethylene terephthalate) through a suitable die. The suture is prepared by braiding very fine filaments in suitable numbers, depending on the gauge required. It may be whitish in colour, or may be coloured with authorised colouring matter or pigments authorised by the competent authority. The suture is sterilised.

CHARACTERS

It is practically insoluble in most of the usual organic solvents, but is attacked by strong alkaline solutions. It is incompatible with phenols.

IDENTIFICATION

- A. It dissolves with difficulty when heated in *dimethylformamide R* and in *dichlorobenzene R*.
- B. To about 50 mg add 10 ml of *hydrochloric acid R1*. The material remains intact even after immersion for 6 h.

TESTS

It complies with the tests prescribed in the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

STORAGE

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

LABELLING

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

01/2005:0606

SILK SUTURE, STERILE, BRAIDED, IN DISTRIBUTOR FOR VETERINARY USE

Filum bombycis tortum sterile in fuso ad usum veterinarium

DEFINITION

Sterile braided silk suture in distributor for veterinary use is obtained by braiding a variable number of threads, according to the diameter required, of degummed silk obtained from the cocoons of the silkworm *Bombyx mori* L. It may be coloured with colouring matter authorised by the competent authority. The suture is sterilised.

IDENTIFICATION

- A. Dissect the end of a strand, using a needle or fine tweezers, to isolate a few individual fibres. The fibres are sometimes marked with very fine longitudinal striations parallel to the axis of the strand. Examined under a microscope, a cross-section is more or less triangular or semi-circular, with rounded edges and without a lumen.

B. Impregnate isolated fibres with *iodinated potassium iodide solution R*. The fibres are coloured pale yellow.

TESTS

It complies with the tests prescribed in the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

STORAGE

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

LABELLING

See the monograph on *Strands, sterile non-absorbable, in distributor for veterinary use (0605)*.

01/2005:0605

STRANDS, STERILE NON-ABSORBABLE, IN DISTRIBUTOR FOR VETERINARY USE

Fila non resorbilia sterilia in fuso ad usum veterinarium

DEFINITION

The statements in this monograph are intended to be read in conjunction with the individual monographs on sterile non-absorbable strands in distributor for veterinary use in the Pharmacopoeia. The requirements do not necessarily apply to sterile non-absorbable strands which are not the subject of such monographs.

Sterile non-absorbable strands in distributor for veterinary use are strands which, when introduced into a living organism, are not metabolised by that organism. Sterile non-absorbable strands vary in origin, which may be animal, vegetable or synthetic. They occur as cylindrical monofilaments or as multifilament strands. Multifilament strands consist of elementary fibres which are assembled by twisting, cabling or braiding. Such strands may be sheathed. Sterile non-absorbable strands may be treated to render them non-capillary, and they may be coloured with colouring matter or pigments authorised by the competent authority. The strands are sterilised.

They are presented in a suitable distributor that allows the withdrawal and use of all or part of the strand in aseptic conditions. The design of the distributor is such that with suitable handling the sterility of the content is maintained even when part of the strand has been removed. They may be stored dry or in a preserving liquid to which an antimicrobial preservative but not an antibiotic may be added.

TESTS

Remove the strand from the distributor and measure promptly and in succession the length, diameter and minimum breaking load.

Length. Measure the length in the condition in which the strand is presented and without applying more tension than is necessary to keep it straight. The length of the strand is not less than 95 per cent of the length stated on the label.

Diameter. Unless otherwise prescribed, measure the diameter by the following method using the strand in the condition in which it is presented. Use a suitable instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10 mm to 15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of 100 ± 10 g to

the strand being tested. When making the measurements, lower the pressor foot slowly to avoid crushing the strand. Make not fewer than one measurement per 2 m of length and in any case not fewer than 12 measurements at points evenly spaced along the strand. During the measurement submit monofilament strands to a tension not greater than that required to keep them straight. Submit multifilament strands to a tension not greater than one-fifth of the minimum breaking load shown in column C of Table 0605.-1 appropriate to the gauge number and type of material concerned or 10 N whichever is less. For multifilament strands of gauge number above 1.5 make two measurements at each point, the second measurement being made after rotating the strand through 90°. The diameter of that point is the average of the two measurements. The average of the measurements carried out on the strand being tested and not less than two-thirds of the individual measurements are within the limits given in the columns under A in Table 0605.-1 for the gauge number concerned. None of the measurements is outside the limits given in the columns under B in Table 0605.-1 for the gauge number concerned.

Table 0605.-1. – *Diameters and minimum breaking loads*

Gauge number	Diameter (millimetres)				Minimum breaking load (newtons)			
	A		B		Linen thread		All other non-absorbable strands	
	min.	max.	min.	max.	C	D	C	D
0.5	0.050	0.069	0.045	0.085	-	-	1.0	0.35
0.7	0.070	0.099	0.060	0.125	1.0	0.3	1.5	0.60
1	0.100	0.149	0.085	0.175	2.5	0.6	3.0	1.0
1.5	0.150	0.199	0.125	0.225	5.0	1.0	5.0	1.5
2	0.200	0.249	0.175	0.275	8.0	2.5	9.0	3.0
2.5	0.250	0.299	0.225	0.325	9.0	5.0	13.0	5.0
3	0.300	0.349	0.275	0.375	11.0	8.0	15.0	9.0
3.5	0.350	0.399	0.325	0.450	15.0	9.0	22.0	13.0
4	0.400	0.499	0.375	0.550	18.0	11.0	27.0	15.0
5	0.500	0.599	0.450	0.650	26.0	15.0	35.0	22.0
6	0.600	0.699	0.550	0.750	37.0	18.0	50.0	27.0
7	0.700	0.799	0.650	0.850	50.0	26.0	62.0	35.0
8	0.800	0.899	0.750	0.950	65.0	37.0	73.0	50.0

Minimum breaking load. Unless otherwise prescribed, determine the minimum breaking load by the following method using the strand in the condition in which it is presented. The minimum breaking load is determined over a simple knot formed by placing one end of a strand held in the right hand over the other end held in the left hand, passing one end over the strand and through the loop so formed (see Figure 0605.-1) and pulling the knot tight.

Make not fewer than one measurement per 2 m of length at points evenly spaced along the strand. Determine the breaking load using a suitable tensiometer. The apparatus has two clamps for holding the strand, one of which is mobile and is driven at a constant rate of 30 cm per minute. The clamps are designed so that the strand being tested can be attached with-out any possibility of slipping. At the beginning of the test the length of strand between the clamps is 12.5 cm to 20 cm and the knot is midway between the clamps. Set the mobile clamp in motion and note the force required to break the strand. If the strand breaks in a clamp or within 1 cm of it, the result is discarded and the test repeated on another part of the strand. The average of all

the results, excluding those legitimately dis-carded, is equal to or greater than the value in column C and no value is less than that given in column D in Table 0605.-1 for the gauge number and type of material concerned.

Figure 0605.-1. – Simple knot

Sterility (2.6.1). They comply with the test for sterility as applied to catgut and other surgical sutures. Carry out the test on three sections each 30 cm long, cut off respectively from the beginning, the centre and the end of the strand.

Extractable colour. Strands that are dyed and intended to remain so during use comply with the test for extractable colour. Place 0.25 g of the strand to be examined in a conical flask, add 25.0 ml of *water R* and cover the mouth of the flask with a short-stemmed funnel. Boil for 15 min, cool and

adjust to the original volume with *water R*. Depending on the colour of the strand, prepare the appropriate reference solution as described in Table 0605.-2 using the primary colour solutions (2.2.2).

Table 0605.-2. – Colour reference solutions

Colour of strand	Composition of reference solution (parts by volume)			
	Red primary solution	Yellow primary solution	Blue primary solution	Water
Yellow - brown	0.2	1.2	–	8.6
Pink - red	1.0	–	–	9.0
Green - blue	–	–	2.0	8.0
Violet	1.6	–	8.4	–

The test solution is not more intensely coloured than the appropriate reference solution.

STORAGE

Store protected from light and heat.

LABELLING

The label states:

- the gauge number,
- the length in centimetres or in metres,
- where appropriate, that the strand is coloured and intended to remain so during use.

01/2005:90006

INTRODUCTION

All general texts and other monographs of the European Pharmacopoeia that are relevant to homoeopathy are applicable.

The "Homoeopathy" chapter of the European Pharmacopoeia contains general monographs and individual monographs describing starting materials and preparations used virtually exclusively for homoeopathic medicines. Reference to these monographs for other purposes may be authorised by licensing authorities.

01/2005:2045

HERBAL DRUGS FOR HOMOEOPATHIC PREPARATIONS

Plantae medicinales ad praeparationes homoeopathicas

DEFINITION

Herbal drugs for homoeopathic preparations are mainly whole, fragmented or cut, plants, parts of plants including algae, fungi or lichens in an unprocessed state, usually in fresh form but sometimes dried. Certain exudates that have not been subjected to a specific treatment are also considered to be herbal drugs for homoeopathic preparations. Herbal drugs for homoeopathic preparations are precisely defined by the botanical scientific name of the source species according to the binomial system (genus, species, variety and author).

PRODUCTION

Herbal drugs for homoeopathic preparations are obtained from cultivated or wild plants. Suitable cultivation, harvesting, collection, sorting, drying, fragmentation and storage conditions are essential to guarantee the quality of herbal drugs for homoeopathic preparations.

Herbal drugs for homoeopathic preparations are, as far as possible, free from impurities such as soil, dust, dirt and other contaminants such as fungal, insect and other animal contaminants. They do not present signs of decay.

If a decontaminating treatment has been used, it is necessary to demonstrate that the constituents of the plant are not affected and that no harmful residues remain. The use of ethylene oxide is prohibited for the decontamination of herbal drugs for homoeopathic preparations.

Adequate measures have to be taken in order to ensure that the microbiological quality of homoeopathic preparations containing one or more herbal drugs comply with the recommendations given in the text on *Microbiological quality of pharmaceutical preparations* (5.1.4).

IDENTIFICATION

Herbal drugs for homoeopathic preparations are identified using their macroscopic and, where necessary, microscopic descriptions and any further tests that may be required (for example, thin-layer chromatography).

TESTS

When a fresh plant is used as a starting material for the manufacture of homoeopathic preparations, the content of foreign matter is as low as possible; if necessary, the maximum content of foreign matter is indicated in the individual monographs. When a dried plant is used as a

starting material for the manufacture of homoeopathic preparations, a test for foreign matter (2.8.2) is carried out, unless otherwise prescribed in the individual monographs.

A specific appropriate test may apply to herbal drugs for homoeopathic preparations liable to be falsified.

If appropriate, the herbal drugs for homoeopathic preparations comply with other tests, for example, total ash (2.4.16) and bitterness value (2.8.15).

The test for loss on drying (2.2.32) is carried out on dried herbal drugs for homoeopathic preparations. A determination of water (2.2.13) is carried out on herbal drugs for homoeopathic preparations with a high essential oil content. The water content of fresh herbal drugs for homoeopathic preparations is determined by an appropriate method.

Herbal drugs for homoeopathic preparations comply with the requirements for pesticide residues (2.8.13). The requirements take into account the nature of the plant, where necessary the preparation in which the plant might be used, and where available the knowledge of the complete record of treatment of the batch of the plant. The content of pesticide residues may be determined by the method described in the annex to the general method.

The risk of contamination of herbal drugs for homoeopathic preparations by heavy metals must be considered. If an individual monograph does not prescribe limits for heavy metals or specific elements, such limits may be required if justified.

Limits for aflatoxins may be required.

In some specific circumstances, the risk of radioactive contamination is to be considered.

ASSAY

Where applicable, herbal drugs for homoeopathic preparations are assayed by an appropriate method.

STORAGE

Fresh herbal drugs are processed as rapidly as possible after harvesting; they may also be stored deep-frozen or in ethanol (96 per cent V/V) or in alcohol of a given concentration. Store dried herbal drugs protected from light.

01/2005:1038

HOMOEOPATHIC PREPARATIONS

Praeparationes homoeopathicas

DEFINITION

Homoeopathic preparations are prepared from substances, products or preparations called stocks, in accordance with a homoeopathic manufacturing procedure. A homoeopathic preparation is usually designated by the Latin name of the stock, followed by an indication of the degree of dilution.

Raw materials

Raw materials for the production of homoeopathic preparations may be of natural or synthetic origin.

For raw materials of zoological or human origin, adequate measures are taken to minimise the risk of agents of infection in the homoeopathic preparations. For this purpose, it is demonstrated that:

- the method of production includes a step or steps that have been shown to remove or inactivate agents of infection,

- where applicable, raw materials of zoological origin comply with the monograph on *Products with risk of transmitting agents of animal spongiform encephalopathies (1483)*,
- where applicable, the animals and the tissues used to obtain the raw materials comply with the health requirements of the competent authorities for animals for human consumption,
- for materials of human origin, the donor follows the recommendations applicable to human blood donors and to donated blood (see *Human plasma for fractionation (0853)*), unless otherwise justified and authorised.

A raw material of botanical, zoological or human origin may be used either in the fresh state or in the dried state. Where appropriate, fresh material may be kept deep-frozen. Raw materials of botanical origin comply with the requirements of the monograph on *Herbal drugs for homoeopathic preparations (2045)*.

Where justified and authorised for transportation or storage purposes, fresh plant material may be kept in ethanol (96 per cent V/V) or in alcohol of a suitable concentration, provided the whole material including the storage medium is used for processing.

Raw materials comply with any requirements of the relevant monographs of the European Pharmacopoeia.

Vehicles

Vehicles are excipients used for the preparation of certain stocks or for the potentisation process. They may include for example: purified water, alcohol of a suitable concentration, glycerol and lactose.

Vehicles comply with any requirements of the relevant monographs of the European Pharmacopoeia.

Stocks

Stocks are substances, products or preparations used as starting materials for the production of homoeopathic preparations. A stock is usually one of the following: a mother tincture or a glycerol macerate, for raw materials of botanical, zoological or human origin, or the substance itself, for raw materials of chemical or mineral origin.

Mother tinctures comply with the requirements of the monograph on *Mother tinctures for homoeopathic preparations (2029)*.

Glycerol macerates are liquid preparations obtained from raw materials of botanical, zoological or human origin by using glycerol or a mixture of glycerol and either alcohol of a suitable concentration or a solution of sodium chloride of a suitable concentration.

Potentisation

Dilutions and triturations are obtained from stocks by a process of potentisation in accordance with a homoeopathic manufacturing procedure: this means successive dilutions and succussions, or successive appropriate triturations, or a combination of the 2 processes.

The potentisation steps are usually one of the following:

- 1 part of the stock plus 9 parts of the vehicle; they may be designated as “D”, “DH” or “X” (decimal),
- 1 part of the stock plus 99 parts of the vehicle; they may be designated as “C” or “CH” (centesimal).

The number of potentisation steps defines the degree of dilution; for example, “D3”, “3 DH” or “3X” means 3 decimal potentisation steps, and “C3”, “3 CH” or “3C” means 3 centesimal potentisation steps.

“LM-” (or “Q-”) potencies are manufactured according to a specific procedure.

Dosage forms

A dosage form of a homoeopathic preparation complies with any relevant dosage form monograph in the European Pharmacopoeia and with the following:

- for the purpose of dosage forms for homoeopathic use “active substances” are considered to be “dilutions or triturations of homoeopathic stocks”,
- these dosage forms are prepared using appropriate excipients,
- the test for uniformity of content is normally not appropriate. However, in certain circumstances, it is required.

Homoeopathic dosage form “pillule”

Pillules for homoeopathic use are solid preparations obtained from sucrose, lactose or other suitable excipients. They may be prepared by impregnation of preformed pillules with a dilution or dilutions of homoeopathic stocks or by progressive addition of these excipients and the addition of a dilution or dilutions of homoeopathic stocks. They are intended for oral or sublingual use.

Homoeopathic dosage form “tablet”

Tablets for homoeopathic use are solid preparations obtained from sucrose, lactose or other suitable excipients according to the monograph on *Tablets (0478)*. They may either be prepared by compressing one or more solid active substances with the excipients or by impregnating preformed tablets with a dilution or dilutions of homoeopathic stocks. The preformed tablets for impregnation are obtained from sucrose, lactose or other suitable excipients according to the monograph on *Tablets (0478)*. They are intended for oral or sublingual use.

01/2005:2029

MOTHER TINCTURES FOR HOMOEOPATHIC PREPARATIONS

Tincturae maternae ad praeparationes homoeopathicas

DEFINITION

Mother tinctures for homoeopathic preparations are liquid preparations obtained by the solvent action of a suitable vehicle upon raw materials. The raw materials are usually in the fresh form but may be dried. Mother tinctures for homoeopathic preparations may also be obtained from plant juices, with, or without the addition of a vehicle. For some preparations, the matter to be extracted may undergo a preliminary treatment.

PRODUCTION

Mother tinctures for homoeopathic preparations are prepared by maceration, digestion, infusion, decoction, fermentation or as described in the individual monographs, usually using alcohol of suitable concentration.

Mother tinctures for homoeopathic preparations are obtained using a fixed proportion of raw material to solvent, taking the moisture content of the raw material into account, unless otherwise justified and authorised.

If fresh plants are used, suitable procedures are used to ensure freshness. The competent authorities may require that the freshness is demonstrated by means of a suitable test.

Mother tinctures for homoeopathic preparations are usually clear. A slight sediment may form on standing and that is acceptable as long as the composition of the tincture is not changed significantly.

The manufacturing process is defined so that it is reproducible.

Production by maceration. Unless otherwise prescribed, reduce the matter to be extracted to pieces of suitable size, mix thoroughly and extract according to the prescribed extraction method with the prescribed extraction solvent. Allow to stand in a closed vessel for the prescribed time. The residue is separated from the extraction solvent and, if necessary, pressed out. In the latter case, the 2 liquids obtained are combined.

Adjustment of the contents. Adjustment of the content of constituents may be carried out if necessary, either by adding the extraction solvent of suitable concentration, or by adding another mother tincture for homoeopathic preparations of the vegetable or animal matter used for the preparation.

IDENTIFICATION

Where applicable, at least 1 chromatographic identification test is carried out.

TESTS

The limits in an individual monograph are set to include official methods of production. Specific limits will apply to each defined method of production.

If the test for relative density is carried out, the test for ethanol need not be carried out, and vice versa.

Relative density (2.2.5). The mother tincture for homoeopathic preparations complies with the limits prescribed in the monograph.

Ethanol (2.9.10). The ethanol content complies with that prescribed in the monograph.

Methanol and 2-propanol (2.9.11): maximum 0.05 per cent V/V of methanol and maximum 0.05 per cent V/V of 2-propanol, unless otherwise prescribed.

Dry residue (2.8.16). Where applicable, the mother tincture for homoeopathic preparations complies with the limits prescribed in the monograph.

Pesticides (2.8.13). Where applicable, the mother tincture for homoeopathic preparations complies with the test. This requirement is met if the herbal drug has been shown to comply with the test.

ASSAY

Where applicable, an assay with quantitative limits is performed.

STORAGE

Protected from light. A maximum storage temperature may be specified.

LABELLING

The label states:

- that the product is a mother tincture for homoeopathic preparations (designated as "TM" or "Ø"),
- the name of the raw material using the Latin title of the European Pharmacopoeia monograph where one exists,
- the method of preparation,
- the ethanol content or other solvent content, in per cent V/V, in the mother tincture,
- the ratio of raw material to mother tincture,
- where applicable, the storage conditions.

01/2005:1599

ARSENIOUS TRIOXIDE FOR HOMOEOPATHIC PREPARATIONS

Arsenii trioxidum ad praeparationes homoeopathicas

As₂O₃M_r 197.8

DEFINITION

Content: 99.5 per cent to 100.5 per cent of As₂O₃.

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble to sparingly soluble in water. It dissolves in solutions of alkali hydroxides and carbonates.

IDENTIFICATION

- Dissolve 20 mg in 1 ml of *dilute hydrochloric acid R*, add 4 ml of *water R* and 0.1 ml of *sodium sulphide solution R*. The resulting yellow precipitate is soluble in *dilute ammonia R1*.
- Dissolve 20 mg in 1 ml of *hydrochloric acid R1*, add 5 ml of *hypophosphorous reagent R* and heat for 15 min on a water-bath. A black precipitate develops.

TESTS

Appearance of solution. A 100 g/l solution in *dilute ammonia R1* is clear (2.2.1) and colourless (2.2.2, *Method II*).

Sulphides. Dissolve 1.0 g in 10.0 ml of *dilute sodium hydroxide solution R*. Add 0.05 ml of *lead acetate solution R*. Any colour in the test solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 10.0 ml of a 0.015 g/l solution of *sodium sulphide R* in *dilute sodium hydroxide solution R* and 0.05 ml of *lead acetate solution R* (20 ppm).

ASSAY

Dissolve 40.0 mg in a mixture of 10 ml of *water R* and 10 ml of *dilute sodium hydroxide solution R*. Add 10 ml of *dilute hydrochloric acid R* and 3 g of *sodium hydrogen carbonate R* and mix. Add 1 ml of *starch solution R* and titrate with 0.05 M iodine.

1 ml of 0.05 M iodine is equivalent to 4.946 mg of As₂O₃.

01/2005:2030

COMMON STINGING NETTLE FOR HOMOEOPATHIC PREPARATIONS

Urtica dioica ad praeparationes homoeopathicas

DEFINITION

Whole, fresh, flowering plant of *Urtica dioica* L.

CHARACTERS

Macroscopic characters described under Identification A. The plant causes an itching, burning sensation on the skin.

IDENTIFICATION

- Common stinging nettle is perennial. The taproot sends out creeping subterranean rhizomes, more or less 4-angled in transverse section, from which extend

adventitious secondary roots and very numerous brownish hairy rootlets. The stipes are erect, generally unbranched, 3 mm to 5 mm in diameter and 0.3 m to 1.5 m high, rarely up to 2.5 m high, 4-angled, greyish-green and covered in short hairs and stinging hairs.

The decussate leaves are 30 mm to 150 mm long and 20 mm to 80 mm wide. The petiole is hispid and usually slightly less than one-third the length of the lamina. The leaf blade is ovate, acuminate, cordate or rounded at the base, and coarsely dentate; the apical tooth is distinctly larger than the lateral teeth. The upper side of the leaves is dark green and usually matt, both sides bear short serried hairs intermingled with long stinging hairs. The 2 stipules are linear-subulate and free. The inflorescences growing from the leaf axils are complex, the flowers unisexual, and, particularly in male plants, generally distinctly longer than the petiole. After shedding their pollen, male inflorescences are erect at an oblique angle or horizontal; female inflorescences are pendent when the fruit is ripe. All flowers have long stalks. The perianth of the male flowers is divided half-way down into equal green lobes, widest at their base, with short bristles and stinging hairs at the margins. The stamens are equal and opposite to the perianth segments, each with a long, whitish filament that curves inwards before pollen is shed and spreads out afterwards. The ovary is rudimentary, button or cup-shaped. The perianth of the female flowers is downy or bristly on the outside and consists of outer, and 2 inner segments; the inner segments are about twice the length of the outer ones. The hypogynous, ovate, unilocular ovary bears a large capitate stigma with a brush-like shock of hair. As the one-seeded fruit grows ripe, the 2 inner segments of the perianth fold around it like wings.

B. It complies with the test for *Urtica urens* (see Tests).

TESTS

Urtica urens. The margin of the lamina is not serrate with teeth twice as long as wide. The clusters of flowers in the axils are longer than the petiole of the leaf. Unisexual, apetalous flowers are not together on the same plant and in the same cluster.

Foreign matter (2.8.2): maximum 5 per cent.

Loss on drying (2.2.32): minimum 65.0 per cent, determined on 5.0 g of finely cut drug by drying in an oven at 100-105 °C for 2 h, if performed to demonstrate the freshness of the drug.

Mother tincture

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations* (2029).

PRODUCTION

The mother tincture of *Urtica dioica* L. is prepared by maceration using alcohol of a suitable concentration.

CHARACTERS

Appearance: greenish-brown or orange-brown liquid.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. The mother tincture to be examined.

Reference solution. Dissolve 10 mg of *phenylalanine R* and 10 mg of *serine R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Plate: *TLC silica gel plate R.*

Mobile phase: *glacial acetic acid R, water R, acetone R, butanol R* (10:20:35:35 V/V/V/V).

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a 1 g/l solution of *ninhydrin R* in *alcohol R*. Heat the plate at 105-110 °C for 5-10 min then examine in daylight within 10 min.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Phenylalanine: a violet to reddish-brown zone	4 red to violet zones
Serine: a reddish-violet zone	A violet zone A violet zone
Reference solution	Test solution

TESTS

Relative density (2.2.5): 0.930 to 0.950.

Ethanol (2.9.10): 40 per cent V/V to 56 per cent V/V.

Dry residue (2.8.16): minimum 1.1 per cent.

01/2005:1610

COPPER FOR HOMOEOPATHIC PREPARATIONS

Cuprum ad praeparationes homoeopathicas

Cu

A_r 63.5

DEFINITION

Content: 99.0 per cent to 101.0 per cent of Cu.

CHARACTERS

Appearance: reddish-brown powder.

Solubility: practically insoluble in water, soluble in hydrochloric acid and in nitric acid, practically insoluble in alcohol.

IDENTIFICATION

A. To 2 ml of solution S (see Tests) add 0.5 ml of *potassium ferrocyanide solution R*. A reddish-brown precipitate is formed.

B. To 5 ml of solution S add 0.6 ml of *ammonia R*. A blue precipitate is formed. Add 2 ml of *ammonia R*. The precipitate disappears; the solution has an intense blue colour.

TESTS

Solution S. Dissolve 2.0 g in 10 ml of *nitric acid R*. After nitrous fumes are no longer evolved, dilute to 60 ml with *distilled water R*.

Acidity or alkalinity. To 5.0 g add 20 ml of *carbon dioxide-free water R*. Boil for 1 min. Cool. Filter and dilute to 25.0 ml with *carbon dioxide free water R*. To 10 ml of the solution add 0.1 ml of *bromothymol blue solution R1*.

Not more than 0.5 ml of 0.01 M hydrochloric acid or 0.01 M sodium hydroxide is required to change the colour of the indicator.

Chlorides (2.4.4): maximum 100 ppm.

15 ml of solution S complies with the limit test for chlorides.

Sulphates (2.4.13): maximum 300 ppm.

15 ml of solution S complies with the limit test for sulphates.

Iron: maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, Method I).

Test solution. Dissolve 1.00 g in 5 ml of nitric acid R and dilute to 50.0 ml with water R.

Reference solutions. Prepare the reference solutions using iron standard solution (20 ppm Fe) R, diluted as necessary with a 1 per cent V/V solution of nitric acid R.

Source: iron hollow-cathode lamp.

Wavelength: 248.3 nm.

Flame: air-acetylene.

Lead: maximum 100 ppm.

Atomic absorption spectrometry (2.2.23, Method I).

Test solution. Use the test solution prepared for the test for iron.

Reference solutions. Prepare the reference solutions using lead standard solution (0.1 per cent Pb) R, diluted as necessary with a 1 per cent V/V solution of nitric acid R.

Source: lead hollow-cathode lamp.

Wavelength: 283.3 nm.

Flame: air-acetylene.

Zinc: maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, Method I).

Test solution. Use the test solution prepared for the test for iron.

Reference solutions. Prepare the reference solutions using zinc standard solution (100 ppm Zn) R, diluted as necessary with a 1 per cent V/V solution of nitric acid R.

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Flame: air-acetylene.

ASSAY

Dissolve 0.100 g in 5 ml of nitric acid R. Heat to expel the nitrous fumes. Add 200 ml of water R and neutralise (2.2.3) with dilute ammonia R1. Add 1 g of ammonium chloride R and 3 mg of murexide R. Titrate with 0.1 M sodium edetate until the colour changes from green to violet.

1 ml of 0.1 M sodium edetate is equivalent to 6.354 mg of Cu.

01/2005:2023

GARLIC FOR HOMOEOPATHIC PREPARATIONS

Allium sativum ad praeparationes homoeopathicas

DEFINITION

Fresh bulb of *Allium sativum* L.

CHARACTERS

Macroscopic characters described under identification.

It has a characteristic odour after cutting.

IDENTIFICATION

The bulb is generally 3 cm to 5 cm broad and almost spherical; the flat base bears the remnants of numerous short greyish-brown adventitious roots. The bulb consists of about 10 daughter bulbs (cloves) arranged roughly in a circle around a central axis. Individual daughter bulbs are 1 cm to 3 cm long, laterally compressed and convex on the dorsal side. Each daughter bulb has a tough, white or reddish skin around a fleshy tubular leaf, investing a more or less rounded elongated cone of leaf primordia and vegetative apex.

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter.

Water (2.2.13): minimum 55.0 per cent, determined on 10.0 g of the finely cut drug, if performed to demonstrate the freshness of the drug.

Mother tincture

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations* (2029).

PRODUCTION

The mother tincture of *Allium sativum* L. is prepared by maceration of the cut drug using alcohol of a suitable concentration.

CHARACTERS

Appearance: brownish-yellow liquid.

It has a peculiar and unpleasant aromatic odour.

IDENTIFICATION

A. To 2 ml of the mother tincture to be examined, add 0.2 ml of dilute sodium hydroxide solution R. A yellowish-white precipitate develops.

B. Thin-layer chromatography (2.2.27).

Test solution. Extract 5 ml of the mother tincture to be examined with 2 quantities, each of 10 ml, of ether R. Combine the ether layers and dry over anhydrous sodium sulphate R. Filter and evaporate the filtrate in a water-bath at low temperature. Dissolve the residue in 0.4 ml of methanol R.

Reference solution. Dissolve 10 mg of resorcinol R, 10 mg of thymol R and 30 mg of gallic acid R in 10 ml of methanol R.

Plate: TLC silica gel F₂₅₄ plate R.

Mobile phase: anhydrous formic acid R, toluene R, di-isopropyl ether R (10:40:50 V/V/V).

Application: 40 µl of the test solution and 10 µl of the reference solution.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm and identify gallic acid; spray with anisaldehyde solution R, heat to 105–110 °C for 5–10 min. Examine in daylight within 10 min.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Other zones may also be visible in the chromatogram obtained with the test solution.

TESTS

Relative density (2.2.5): 0.885 to 0.960.

Ethanol (2.9.10): 50 per cent V/V to 70 per cent V/V.

Dry residue (2.8.16): minimum 4.0 per cent.

STORAGE

In an airtight container, protected from light.

01/2005:2024

HONEY BEE FOR HOMOEOPATHIC PREPARATIONS

Apis mellifera
ad praeparationes homoeopathicas

DEFINITION

Live worker honey bee (*Apis mellifera* L.).

CHARACTERS

Characters described under Identification.

PRODUCTION

If the bee has been exposed to treatment to prevent or cure diseases, appropriate steps are taken to ensure that the levels of residues are as low as possible.

IDENTIFICATION

The body of a honey bee is about 15 mm long, black, with a silky sheen, and covered with red hairs with a touch of grey. The broad tibiae are without spines. The posterior margins of the segments and legs are brown, with gradual transition to orange-red. The claws are two-membered, the maxillary palps single-membered. On the hind legs are baskets or scoops invested with bristles. The wings have 3 complete cubital cells, with the radial cell twice as long as it is wide; the 3 cells on the lower margin and the 3 middle cells are closed. A duct connects the barbed sting with the poison sac.

Mother tincture

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations* (2029).

PRODUCTION

The mother tincture of *Apis mellifera* L. is prepared by maceration using alcohol of a suitable concentration.

CHARACTERS

Pale yellow liquid that may darken on storage.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. The mother tincture to be examined.

Reference solution. Dissolve 12 mg of 4-aminobutanoic acid R, 12 mg of leucine R and 12 mg of proline R in 5 ml of water R and dilute to 50 ml with alcohol R.

Plate: TLC silica gel plate R.

Mobile phase: water R, ethanol R (17:63 V/V).

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with ninhydrin solution R and heat at 100-105 °C for 10 min; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Other zones may also be visible.

TESTS

Relative density (2.2.5): 0.890 to 0.910.

Ethanol (2.9.10): 60 per cent V/V to 70 per cent V/V.

Dry residue (2.8.16): minimum 0.30 per cent.

01/2005:2028

HYPERICUM FOR HOMOEOPATHIC PREPARATIONS

Hypericum perforatum
ad praeparationes homoeopathicas

DEFINITION

Whole, fresh plant of *Hypericum perforatum* L., at the beginning of the flowering period.

CHARACTERS

Macroscopic characters described under Identification.

IDENTIFICATION

The perennial plant consists of a spindle-shaped root and a branched rhizome, giving rise to long, decumbent runners. The cylindrical, erect stem is woody at the base, 0.2 m to 1 m long, branched in the upper part, with 2 raised longitudinal lines.

The leaves are opposite, sessile, exstipulate, oblong-oval and 15 mm to 30 mm long. The leaf margins show black glandular dots, and many small translucent oil glands are present on the entire surface and are visible by transmitted light.

The flowers are regular and form corymbose clusters at the apex of the stem. They have 5 green, lanceolate sepals with acuminate apices, and black oil glands near the entire margins; 5 orange-yellow petals, much longer than the sepals, with black oil glands near the terminal margins only; 3 staminal blades, each divided into many orange-yellow stamens and 3 carpels surmounted by red styles. Each petal is asymmetrically linear-ovate in shape, with one of the margin entire and the other dentate.

TESTS

Foreign matter (2.8.2): maximum 4 per cent of fruits and maximum 1 per cent of other foreign matter.

Loss on drying (2.2.32): if performed to demonstrate the freshness of the drug, minimum 55 per cent, determined on 5.0 g of finely cut drug by drying in an oven at 100-105 °C.

Mother tincture

The mother tincture complies with the requirements of the general monograph on *Mother tinctures for homoeopathic preparations* (2029).

PRODUCTION

The mother tincture of *Hypericum perforatum* L. is prepared by maceration using alcohol of a suitable concentration.

CHARACTERS

Dark red to brownish red liquid.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. The mother tincture to be examined.

Reference solution. Dissolve 5 mg of *rutin R*, 1 mg of *hypericin R* and 5 mg of *hyperoside R* in *methanol R* and dilute to 5 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (6:9:90 V/V/V).

Application: 10 µl of the test solution and 5 µl of the reference solution, as 10 mm bands.

Development: over a path of 10 cm.

Drying: at 100-105 °C for 10 min.

Detection: spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then a 50 g/l solution of *macrogol 400 R* in *methanol R*. Examine the plates after 30 min in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. In the chromatogram obtained with the test solution, the zone due to rutin may be weak or even absent. The chromatogram obtained with the test solution shows a group of zones that may be blue or yellow, with a *R_f* similar to that of the zone due to hyperoside in the chromatogram obtained with the reference solution. Other weak zones may also be visible.

Top of the plate	
Hypericin: a red zone	A yellow to blue zone 2 red zones
Hyperoside: a yellow to orange zone	Several zones Blue or yellow zones
Rutin: a yellow to orange zone	A yellow to orange zone
Reference solution	Test solution

TESTS

Relative density (2.2.5): 0.900 to 0.920.

Ethanol (2.9.10): 60 per cent V/V to 75 per cent V/V.

Dry residue (2.8.16): minimum 1.3 per cent.

corrected

IRON FOR HOMOEOPATHIC PREPARATIONS

Ferrum ad praeparationes homoeopathicas

Fe

A_r 55.85

DEFINITION

Obtained by reduction or sublimation as a fine blackish-grey powder.

Content: 97.5 per cent to 101.0 per cent.

CHARACTERS

Appearance: fine, blackish-grey powder, without metallic lustre.

Solubility: practically insoluble in water and in alcohol. It dissolves with heating in dilute mineral acids.

IDENTIFICATION

Dissolve 50 mg in 2 ml of *dilute sulphuric acid R* and dilute to 10 ml with *water R*. The solution gives reaction (a) of iron (2.3.1).

TESTS

Solution S. To 10.0 g add 40 ml of *water R*. Boil for 1 min. Cool, filter and dilute to 50.0 ml with *water R*.

Alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.1 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to yellow.

Substances insoluble in hydrochloric acid. Dissolve 2.00 g in 40 ml of *hydrochloric acid R*. Heat on a water-bath. As soon as fumes are no longer evolved, filter through a sintered-glass filter No. 16 (2.1.2). Rinse with *water R*. Dry the residue in an oven at 100-105 °C for 1 h. The residue weighs a maximum of 20 mg (1.0 per cent).

Substances soluble in water. Evaporate 10.0 ml of solution S on a water-bath and dry at 100-105 °C for 1 h. The residue weighs a maximum of 2 mg (0.1 per cent).

Chlorides (2.4.4): maximum 50 ppm.

Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Sulphides and phosphides. In a 100 ml conical flask carefully mix 1.0 g with 10 ml of *dilute hydrochloric acid R*. Within 30 s *lead acetate paper R* moistened with *water R* and placed over the mouth of the flask is not coloured more intensely than light brown by the resulting fumes.

Arsenic (2.4.2): maximum 5 ppm.

Boil 0.2 g in 25 ml of *dilute hydrochloric acid R* until completely dissolved. The solution complies with limit test A.

Copper: maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 1.00 g in a mixture of 60 ml of *dilute hydrochloric acid R* and 10 ml of *dilute hydrogen peroxide solution R*. Reduce to a volume of 5 ml and dilute to 50.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *copper standard solution (0.1 per cent Cu) R*, diluted as necessary with a 1 per cent V/V solution of *hydrochloric acid R*.

Source: copper hollow-cathode lamp.

Wavelength: 324.8 nm.

Flame: air-acetylene.

Lead: maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. In a separating funnel, place 20 ml of the test solution prepared for the test for copper. Add 25 ml of *lead-free hydrochloric acid R*. Stir with 3 quantities, each of 25 ml, of *di-isopropyl ether R*. Collect the aqueous layer.

Add 0.10 g of *sodium sulphate decahydrate R*. Evaporate to dryness. Take up the residue with 1 ml of *lead-free nitric acid R* and dilute to 20 ml with *water R*.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R*, diluted as necessary with a 10 per cent V/V solution of *nitric acid R* containing 5 g/l of *sodium sulphate decahydrate R*.

Source: lead hollow-cathode lamp.

Wavelength: 217 nm.

Flame: air-acetylene.

ASSAY

Stir for 10 min 0.100 g in a hot solution of 1.25 g of *copper sulphate R* in 20 ml of *water R* in a 100 ml conical flask with a ground-glass stopper. Filter rapidly and wash the filter. Combine the filtrate and the washings, acidify with *dilute sulphuric acid R* and titrate with 0.02 M *potassium permanganate* until a pink colour is obtained.

1 ml of 0.02 M *potassium permanganate* is equivalent to 5.585 mg of Fe.

LABELLING

The label indicates whether the iron for homoeopathic preparations is obtained by reduction or sublimation.

01/2005:1624

SAFFRON FOR HOMOEOPATHIC PREPARATIONS

Croci stigma ad praeparationes homoeopathicas

DEFINITION

Dried stigmas of *Crocus sativus* L. usually joined by the base to a short style.

CHARACTERS

Saffron has a characteristic, aromatic odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The dark brick-red stigmas, when dry, are 20 mm to 40 mm long and after soaking with water, about 35 mm to 50 mm long. The tubes, gradually widening at the top, are incised on one side, the upper margin is open and finely crenated. The style connecting the 3 stigmas is pale yellow and not more than 5 mm long.
- B. Examine under a microscope using *chloral hydrate solution R*. It shows the following diagnostic characters: elongated epidermal cells, frequently with a short, central papilla; in water they release a yellow colouring matter; the upper border of the stigma has finger-shaped papillae, up to 150 µm long; between them are single, globular pollen grains, about 100 µm wide, with a finely pitted exine, vascular bundles with small spirally thickened vessels and no fibres.
- C. Carefully crush pieces of the drug to coarse particles and moisten with 0.2 ml of *phosphomolybdic acid solution R*. The particles turn blue within 1-2 min or they have a blue areole around them.
- D. Examine by thin-layer chromatography (2.2.27).

Test solution. Carefully crush 0.1 g of the drug with a glass rod and moisten with 0.2 ml of *water R*. After 3 min add 5 ml of *methanol R*, allow to stand for 20 min, protected from light, and filter through a plug of glass wool.

Reference solution. Dissolve 5 mg of *naphthol yellow R* in 5 ml of *methanol R* and add a solution of 5 mg of *Sudan red G R* in 5 ml of *methylethylene chloride R*.

Plate: TLC silica gel F₂₅₄ plate R.

Mobile phase: *water R*, 2-propanol R, *ethyl acetate R* (10:25:65 V/V/V).

Application: 10 µl of the test solution and 5 µl of the reference solution as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.

Top of the plate	
A red zone	2 yellow zones An intense yellow zone (crocin)
A yellow zone	
Reference solution	Test solution

Detection: in ultraviolet light at 254 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.

Top of the plate	
A red zone	1 or 2 quenching zones
A yellow zone	A quenching zone
Reference solution	Test solution

Detection: spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.

Top of the plate	
A red zone	1 or 2 red to reddish-violet zones
A blue to bluish-green zone	A red to reddish-violet zone
	2 blue to bluish-green zones
	An intense blue to bluish-green zone (crocin)
Reference solution	Test solution

- E. Dilute 0.1 ml of the test solution (see Identification test D) with 1 ml of *methanol R*. Deposit 0.1 ml of this solution on a filter paper, allow to dry and spray with a 10 g/l

solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Examine in ultraviolet light at 365 nm. The spot shows an intense orange-yellow fluorescence.

TESTS

Colouring power. Introduce 0.10 g into a 5 ml volumetric flask and add to 5.0 ml with *distilled water R*. Close the flask and shake every 30 min for 8 h. Then allow to stand for 16 h. Dilute 1.0 ml to 500.0 ml with *distilled water R*. The absorbance (2.2.25) measured at 440 nm using *distilled water R* as the compensation liquid, is not less than 0.44.

Foreign matter. Examine the drug microscopically. No parts with rough walls, no crystals and no pollen grains containing 3 germinal pores are present.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 100-105 °C.

Total ash (2.4.16): maximum 7.0 per cent, determined on the residue obtained in the test for loss on drying.

01/2005:0307

ACACIA**Acaciae gummi****DEFINITION**

Acacia is the air-hardened, gummy exudate flowing naturally from or obtained by incision of the trunk and branches of *Acacia senegal* L. Willdenow, other species of *Acacia* of African origin and *Acacia seyal* Del.

CHARACTERS

Acacia is almost completely but very slowly soluble, after about 2 h, in twice its mass of water leaving only a very small residue of vegetable particles; the liquid obtained is colourless or yellowish, dense, viscous, adhesive, translucent and weakly acid to blue litmus paper. Acacia is practically insoluble in alcohol.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. Acacia occurs as yellowish-white, yellow or pale amber, sometimes with a pinkish tint, friable, opaque, spheroidal, oval or reniform pieces (tears) of a diameter from about 1 cm to 3 cm, frequently with a cracked surface, easily broken into irregular, whitish or slightly yellowish angular fragments with conchoidal fracture and a glassy and transparent appearance. In the centre of an unbroken tear there is sometimes a small cavity.
- B. Reduce to a powder (355). The powder is white or yellowish-white. Examine under a microscope using *glycerol R* (50 per cent *V/V*). The powder presents angular, irregular, colourless, transparent fragments. Only traces of starch or vegetable tissues are visible. No stratified membrane is apparent.
- C. Examine the chromatograms obtained in the test for glucose and fructose. The chromatogram obtained with the test solution shows three zones due to galactose, arabinose and rhamnose. No other important zones are visible, particularly in the upper part of the chromatogram.
- D. Dissolve 1 g of the powdered drug (355) in 2 ml of *water R* by stirring frequently for 2 h. Add 2 ml of *alcohol R*. After shaking, a white, gelatinous mucilage is formed which becomes fluid on adding 10 ml of *water R*.

TESTS

Solution S. Dissolve 3.0 g of the powdered drug (355) in 25 ml of *water R* by stirring for 30 min. Allow to stand for 30 min and dilute to 30 ml with *water R*.

Insoluble matter. To 5.0 g of the powdered drug (355) add 100 ml of *water R* and 14 ml of *dilute hydrochloric acid R*, boil gently for 15 min, shaking frequently, and filter while hot through a tared sintered-glass filter. Wash with hot *water R* and dry at 100-105 °C. The residue weighs not more than 25 mg (0.5 per cent).

Glucose and fructose. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. To 0.100 g of the powdered drug (355) in a thick-walled centrifuge tube add 2 ml of a 100 g/l solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant carefully into a 50 ml flask, add 10 ml

of *water R* and evaporate the solution to dryness under reduced pressure. To the resulting clear film add 0.1 ml of *water R* and 0.9 ml of *methanol R*. Centrifuge to separate the amorphous precipitate. Dilute the supernatant, if necessary, to 1 ml with *methanol R*.

Reference solution. Dissolve 10 mg of *arabinose R*, 10 mg of *galactose R*, 10 mg of *glucose R*, 10 mg of *rhamnose R* and 10 mg of *xylose R* in 1 ml of *water R* and dilute to 10 ml with *methanol R*.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of a 16 g/l solution of *sodium dihydrogen phosphate R*, 40 volumes of *butanol R* and 50 volumes of *acetone R*. Dry the plate in a current of warm air for a few minutes and develop again over a path of 15 cm using the same mobile phase. Dry the plate at 110 °C for 10 min, spray with *anisaldehyde solution R* and heat again at 110 °C for 10 min. The chromatogram obtained with the reference solution shows five clearly separated coloured zones due to galactose (greyish-green to green), glucose (grey), arabinose (yellowish-green), xylose (greenish-grey to yellowish-grey) and rhamnose (yellowish-green), in order of increasing *R_f* value. The chromatogram obtained with the test solution shows no grey zone and no greyish-green zone between the zones corresponding to galactose and arabinose in the chromatogram obtained with the reference solution.

Starch, dextrin and agar. To 10 ml of solution S previously boiled and cooled add 0.1 ml of 0.05 *M iodine*. No blue or reddish-brown colour develops.

Sterculia gum

- A. Place 0.2 g of the powdered drug (355) in a 10 ml ground-glass-stoppered cylinder graduated in 0.1 ml. Add 10 ml of *alcohol (60 per cent V/V) R* and shake. Any gel formed occupies not more than 1.5 ml.
- B. To 1.0 g of the powdered drug (355) add 100 ml of *water R* and shake. Add 0.1 ml of *methyl red solution R*. Not more than 5.0 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator.

Tannins. To 10 ml of solution S add 0.1 ml of *ferric chloride solution R1*. A gelatinous precipitate is formed, but neither the precipitate nor the liquid shows a dark blue colour.

Tragacantha. Examine the chromatograms obtained in the test for glucose and fructose. The chromatogram obtained with the test solution shows no greenish-grey to yellowish-grey zone corresponding to the zone of xylose in the chromatogram obtained with the reference solution.

Loss on drying (2.2.32). Not more than 15.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C.

Total ash (2.4.16). Not more than 4.0 per cent.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10⁴ micro-organisms per gram, determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

01/2005:0308

ACACIA, SPRAY-DRIED**Acaciae gummi dispersione desiccatum****DEFINITION**

Spray-dried acacia is obtained from a solution of acacia.

CHARACTERS

It dissolves completely and rapidly, after about 20 min, in twice its mass of water. The liquid obtained is colourless or yellowish, dense, viscous, adhesive, translucent and weakly acid to blue litmus paper. Spray-dried acacia is practically insoluble in alcohol.

IDENTIFICATION

- A. Examined under a microscope, in *alcohol R*, the powder is seen to consist predominantly of spheroidal particles about 4 µm to 40 µm in diameter, with a central cavity containing one or several air-bubbles; a few minute flat fragments are present. Only traces of starch granules are visible. No vegetable tissue is seen.
- B. Examine the chromatograms obtained in the test for glucose and fructose. The chromatogram obtained with the test solution shows 3 zones due to galactose, arabinose and rhamnose. No other important zones are visible, particularly in the upper part of the chromatogram.
- C. Dissolve 1 g of the drug to be examined in 2 ml of *water R* by stirring frequently for 20 min. Add 2 ml of *alcohol R*. After shaking a white gelatinous mucilage is formed which becomes fluid on adding 10 ml of *water R*.

TESTS

Solution S. Dissolve 3.0 g of the drug to be examined in 25 ml of *water R* by stirring for 10 min. Allow to stand for 20 min and dilute to 30 ml with *water R*.

Glucose and fructose. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. To 0.100 g in a thick-walled centrifuge tube add 2 ml of a 100 g/l solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant carefully into a 50 ml flask, add 10 ml of *water R* and evaporate the solution to dryness under reduced pressure. To the resulting clear film add 0.1 ml of *water R* and 0.9 ml of *methanol R*. Centrifuge to separate the amorphous precipitate. Dilute the supernatant, if necessary, to 1 ml with *methanol R*.

Reference solution. Dissolve 10 mg of *arabinose R*, 10 mg of *galactose R*, 10 mg of *glucose R*, 10 mg of *rhamnose R* and 10 mg of *xylose R* in 1 ml of *water R* and dilute to 10 ml with *methanol R*.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of a 16 g/l solution of *sodium dihydrogen phosphate R*, 40 volumes of *butanol R* and 50 volumes of *acetone R*. Dry the plate in a current of warm air for a few minutes and develop again over a path of 15 cm using the same mobile phase. Dry the plate at 110 °C for 10 min, spray with *anisaldehyde solution R* and heat again at 110 °C for 10 min. The chromatogram obtained with the reference solution shows 5 clearly separated coloured zones due to galactose (greyish-green to green), glucose (grey), arabinose (yellowish-green) xylose (greenish-grey to yellowish-grey) and rhamnose (yellowish-green), in order of increasing R_f value. The chromatogram obtained with the test solution shows no grey zone and no greyish-green zone between the zones corresponding to galactose and arabinose in the chromatogram obtained with the reference solution.

Starch, dextrin and agar. To 10 ml of solution S previously boiled and cooled add 0.1 ml of 0.05 M *iodine*. No blue or reddish-brown colour develops.

Sterculia gum

- A. Place 0.2 g in a 10 ml ground-glass-stoppered cylinder graduated in 0.1 ml. Add 10 ml of *alcohol (60 per cent V/V) R* and shake. Any gel formed occupies not more than 1.5 ml.
- B. To 1.0 g add 100 ml of *water R* and shake. Add 0.1 ml of *methyl red solution R*. Not more than 5.0 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Tannins. To 10 ml of solution S add 0.1 ml of *ferric chloride solution R1*. A gelatinous precipitate is formed, but neither the precipitate nor the liquid shows a dark blue colour.

Tragacantha. Examine the chromatograms obtained in the test for Glucose and fructose. The chromatogram obtained with the test solution shows no greenish-grey to yellowish-grey zone corresponding to the zone of xylose in the chromatogram obtained with the reference solution.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Total ash (2.4.16). Not more than 4.0 per cent.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10⁴ micro-organisms per gram, determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

01/2005:1585

ACAMPROSATE CALCIUM

Acamprosatum calcicum

C₁₀H₂₀CaN₂O₈S₂M_r 400.5

DEFINITION

Calcium bis[3-(acetylamino)propane-1-sulphonate].

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white powder.

Solubility: freely soluble in water, practically insoluble in alcohol and in methylene chloride.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of acamprosate calcium*.

- B. It gives reaction (a) of calcium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3): 5.5 to 7.0 for solution S.

Impurity A. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.40 g of the substance to be examined in *distilled water R* and dilute to 20.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *borate buffer solution pH 10.4 R*. Place 3.0 ml of the solution obtained in a 25 ml ground-glass-stoppered

01/2005:0871

ACEBUTOLOL HYDROCHLORIDE

Acebutololi hydrochloridum

 $C_{18}H_{29}ClN_2O_4$

DEFINITION

N-[3-Acetyl-4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]butanamide hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in alcohol, very slightly soluble in acetone and in methylene chloride.

mp: about 143 °C.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 20.0 mg in a 0.1 per cent *V/V* solution of *hydrochloric acid R* and dilute to 100.0 ml with the same acid solution. Dilute 5.0 ml to 100.0 ml with a 0.1 per cent *V/V* solution of *hydrochloric acid R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows 2 absorption maxima, at 233 nm and 322 nm. The specific absorbance at the maximum at 233 nm is 555 to 605.

- B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *acebutolol hydrochloride CRS*.

- C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *acebutolol hydrochloride CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *pindolol CRS* in *methanol R* and dilute to 20 ml with the same solvent. To 1 ml add 1 ml of reference solution (a).

Plate: *TLC silica gel F₂₅₄ plate R*.

Mobile phase: *perchloric acid R*, *methanol R*, *water R* (5:395:600 *V/V/V*).

Application: 10 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

- D. It gives reaction (a) of chlorides (2.3.1).

tube. Add 0.15 ml of a freshly prepared 5 g/l solution of *fluorescamine R* in *acetonitrile R*. Shake immediately and vigorously for 30 s. Place in a water-bath at 50 °C for 30 min. Cool under a stream of cold water. Centrifuge and filter the supernatant through a suitable membrane filter (0.45 µm), 25 mm in diameter.

Reference solution. Dissolve 50 mg of *acamprosate impurity A CRS* in *distilled water R* and dilute to 200.0 ml with the same solvent. Dilute 0.4 ml of the solution to 100.0 ml with *borate buffer solution pH 10.4 R*. Treat 3.0 ml of this solution in the same way as the test solution

Column:

- *size*: *l* = 0.15 m, Ø = 4.6 mm,
- *stationary phase*: *spherical octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 170 m²/g and a pore size of 12 nm.

Mobile phase: *acetonitrile R*, *methanol R*, *0.1 M phosphate buffer solution pH 6.5 R* (10:10:80 *V/V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 261 nm.

Injection: 20 µl.

Run time: 6 times the retention time of impurity A

Retention times: *fluorescamine* = about 4 min; *impurity A* = about 8 min; *acamprosate* is not detected by this system.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in *distilled water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.4 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

To 4 g of *cation exchange resin R* (75–150 µm) add 20 ml of *distilled water R* and stir magnetically for 10 min. Introduce this suspension into a glass column, 45 cm long and 2.2 cm in internal diameter, equipped with a polytetrafluoroethylene flow cap covered by a glass-wool plug. Allow a few millilitres of this solution to flow, then place a plug of glass wool over the resin. Pass 50 ml of *1 M hydrochloric acid* through the column. The pH of the eluate is close to 1. Wash with 3 quantities, each of 200 ml, of *distilled water R* to obtain an eluate at pH 6. Dissolve 0.100 g of the substance to be examined in 15 ml of *distilled water R*. Pass through the column and wash with 3 quantities, each of 25 ml, of *distilled water R*, collecting the eluate. Allow to elute until an eluate at pH 6 is obtained. Titrate the solution obtained with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of *0.1 M sodium hydroxide* corresponds to 20.02 mg of $C_{10}H_{20}CaN_2O_8S_2$.

IMPURITIES

- A. 3-aminopropane-1-sulphonic acid (homotaurine).

TESTS

Appearance of solution. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, Method II).

Dissolve 0.5 g in *water R* and dilute to 10 ml with the same solvent.

pH (2.2.3): 5.0 to 7.0.

Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). Dissolve 20.0 mg of the substance to be examined in mobile phase A and dilute to 100.0 ml with mobile phase A. Dilute 0.5 ml to 50.0 ml with mobile phase A.

Reference solution (b). Dissolve 5.0 mg of *acebutolol impurity I CRS* in 10.0 ml of *acetonitrile R* and dilute to 25.0 ml with mobile phase A. Dilute 1.0 ml to 50.0 ml with mobile phase A.

Reference solution (c). Mix 2.0 ml of reference solution (a) and 1.0 ml of reference solution (b) and dilute to 10.0 ml with mobile phase A.

Reference solution (d). Dissolve 5.0 mg of *acebutolol impurity C CRS* in 10 ml of *acetonitrile R* and dilute to 25.0 ml with mobile phase A. Dilute 0.5 ml to 50.0 ml with mobile phase A.

Reference solution (e). Dissolve 5.0 mg of *acebutolol impurity B CRS* in 10.0 ml of *acetonitrile R* and dilute to 25.0 ml with mobile phase A. Dilute 1.0 ml to 50.0 ml with mobile phase A.

Column:

- **size:** $l = 0.125$ m, $\varnothing = 4$ mm,
- **stationary phase:** *end-capped octadecylsilyl silica gel for chromatography R* (5 μ m),
- **temperature:** 40 °C.

Mobile phase:

- **mobile phase A:** mix 2.0 ml of *phosphoric acid R*, and 3.0 ml of *triethylamine R* and dilute to 1000 ml with *water R*,
- **mobile phase B:** mix equal volumes of *acetonitrile R* and mobile phase A,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 2	98	2
2 - 30.5	98 → 10	2 → 90
30.5 - 41	10	90
41 - 42	10 → 98	90 → 2
42 - 50	98	2

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 25 μ l.

System suitability: reference solution (c):

- **resolution:** minimum 7.0 between the peaks due to impurity I and acebutolol.

Limits:

- **impurity B:** not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent),
- **impurity C:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent),
- **impurity I:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total of impurities:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 0.50 g of the substance to be examined in 20.0 ml of *water R*. The solution complies with limit test E. Prepare the standard by diluting 10.0 ml of *lead standard solution* (1 ppm Pb) *R* to 20.0 ml with *water R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of *alcohol R* and add 1 ml of 0.1 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 37.29 mg of C₁₈H₂₉ClN₂O₄.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J, K.

A. *N*-[3-acetyl-4-[(2*RS*)-oxiran-2-ylmethoxy]phenyl]butanamide,

01/2005:1281

- B. R1 = R2 = CO-CH₃: *N*-[3-acetyl-4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]acetamide (diacetolol),
- D. R1 = H, R2 = CO-CH₃: 1-[5-amino-2-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]ethanone,
- E. R1 = CO-CH₂-CH₂-CH₃, R2 = H: *N*-[4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]butanamide,
- J. R1 = CO-CH₂-CH₃, R2 = CO-CH₃: *N*-[3-acetyl-4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]propanamide,
- K. R1 = R2 = CO-CH₂-CH₂-CH₃: *N*-[3-butanoyl-4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]butanamide,

- C. *N*-(3-acetyl-4-hydroxyphenyl)butanamide,

- F. R = OH: *N*-[3-acetyl-4-[(2*RS*)-2,3-dihydroxypropoxy]phenyl]butanamide,
- I. R = NH-CH₂-CH₃: *N*-[3-acetyl-4-[(2*RS*)-3-(ethylamino)-2-hydroxypropoxy]phenyl]butanamide,

- G. *N,N'*-[[1-(1-methylethyl)imino]bis[(2-hydroxypropane-1,3-diyl)oxy(3-acetyl-1,4-phenylene)]]dibutanamide (biamine),

- H. *N,N'*-[(2-hydroxypropane-1,3-diyl)bis[oxy(3-acetyl-1,4-phenylene)]]dibutanamide,

ACECLOFENAC

Aceclofenacum

C₁₆H₁₃Cl₂NO₄M_r 354.2

DEFINITION

[[[2-[(2,6-Dichlorophenyl)amino]phenyl]acetyl]oxy]acetic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 50.0 ml with *methanol R*. Examined between 220 nm and 370 nm (2.2.25), the solution shows an absorption maximum at 275 nm. The specific absorbance at the absorption maximum is 320 to 350.
- B. Infrared absorption spectrophotometry (2.2.24).
Comparison: Ph. Eur. reference spectrum of aceclofenac.
- C. Dissolve about 10 mg in 10 ml of *alcohol R*. To 1 ml of the solution, add 0.2 ml of a mixture, prepared immediately before use, of equal volumes of a 6 g/l solution of *potassium ferricyanide R* and a 9 g/l solution of *ferric chloride R*. Allow to stand protected from light for 5 min. Add 3 ml of a 10.0 g/l solution of *hydrochloric acid R*. Allow to stand protected from light for 15 min. A blue colour develops and a precipitate is formed.

TESTS

Related substances. Liquid chromatography (2.2.29).
Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B and dilute to 25.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 21.6 mg of *diclofenac sodium CRS* in a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.0 ml of the test solution to 10.0 ml with a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B.

Reference solution (c). Mix 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b) and dilute to 100.0 ml with a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B.

Reference solution (d). Dissolve 4.0 mg of *aceclofenac impurity F CRS*, 2.0 mg of *aceclofenac impurity H CRS* and 2.0 mg of *diclofenac impurity A CRS* (aceclofenac impurity I) in a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (e). Mix 1.0 ml of reference solution (b) and 1.0 ml of reference solution (d) and dilute to 100.0 ml with a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 μ m) with a pore size of 10 nm and a carbon loading of 19 per cent,
- **temperature:** 40 °C.

Mobile phase:

- **mobile phase A:** 1.12 g/l solution of *phosphoric acid R* adjusted to pH 7.0 using a 42 g/l solution of *sodium hydroxide R*,
- **mobile phase B:** *water R*, *acetonitrile R* (1:9 V/V),

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 25	70 → 50	30 → 50
25 - 30	50 → 20	50 → 80
30 - 50	20	80
50 - 52	20 → 70	80 → 30
52 - 65	70	30

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 10 μ l; inject the test solution and reference solutions (c) and (e).

Relative retention with reference to aceclofenac (retention time = about 14 min): impurity A = about 0.8; impurity G = about 1.3; impurity H = about 1.5; impurity I = about 2.3; impurity D = about 2.6; impurity B = about 2.7; impurity E = about 2.8; impurity C = about 3.0; impurity F = about 3.2.

System suitability: reference solution (c):

- **resolution:** minimum 5.0 between the peaks due to aceclofenac and to impurity A.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- **impurities B, C, D, E, G:** for each impurity, not more than the area of the peak due to aceclofenac in the chromatogram obtained with reference solution (e) (0.2 per cent),
- **impurity F:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (0.2 per cent),
- **impurity H:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (0.1 per cent),

- **impurity I:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (0.1 per cent),
- **any other impurity:** not more than half the area of the peak due to aceclofenac in the chromatogram obtained with reference solution (e) (0.1 per cent),
- **total:** not more than 0.7 per cent,
- **disregard limit:** 0.1 times the area of the peak due to aceclofenac in the chromatogram obtained with reference solution (e) (0.02 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

To 2.0 g in a silica crucible, add 2 ml of *sulphuric acid R* to wet the substance. Heat progressively to ignition and continue heating until an almost white or at most a greyish residue is obtained. Carry out the ignition at a temperature not exceeding 800 °C. Allow to cool. Add 3 ml of *hydrochloric acid R* and 1 ml of *nitric acid R*. Heat and evaporate slowly to dryness. Cool and add 1 ml of a 100 g/l solution of *hydrochloric acid R* and 10.0 ml of *distilled water R*. Neutralise with a 1.0 g/l solution of *ammonia R* using 0.1 ml of *phenolphthalein solution R* as indicator. Add 2.0 ml of a 60 g/l solution of *anhydrous acetic acid R* and dilute to 20 ml with *distilled water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 40 ml of *methanol R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 35.42 mg of $C_{16}H_{13}Cl_2NO_4$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

- A. R = H: [2-[(2,6-dichlorophenyl)amino]phenyl]acetic acid (diclofenac),
- B. R = CH₃: methyl [2-[(2,6-dichlorophenyl)amino]phenyl]acetate (methyl ester of diclofenac),
- C. R = C₂H₅: ethyl [2-[(2,6-dichlorophenyl)amino]phenyl]acetate (ethyl ester of diclofenac),

- D. $R = \text{CH}_3$: methyl [[2-[(2,6-dichlorophenyl)amino]phenyl]acetyl]oxy]acetate (methyl ester of aceclofenac),
- E. $R = \text{C}_2\text{H}_5$: ethyl [[2-[(2,6-dichlorophenyl)amino]phenyl]acetyl]oxy]acetate (ethyl ester of aceclofenac),
- F. $R = \text{CH}_2\text{-C}_6\text{H}_5$: benzyl [[2-[(2,6-dichlorophenyl)amino]phenyl]acetyl]oxy]acetate (benzyl ester of aceclofenac),
- G. $R = \text{CH}_2\text{-CO}_2\text{H}$: [[[[2-[(2,6-dichlorophenyl)amino]phenyl]acetyl]oxy]acetyl]oxy]acetic acid (acetic aceclofenac),
- H. $R = \text{CH}_2\text{-CO-O-CH}_2\text{-CO}_2\text{H}$: [[[[[2-[(2,6-dichlorophenyl)amino]phenyl]acetyl]oxy]acetyl]oxy]acetic acid (diacetic aceclofenac),

- I. 1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indol-2-one.

01/2005:1282

ACESULFAME POTASSIUM

Acesulfamum kalicum

 $\text{C}_4\text{H}_4\text{KNO}_4\text{S}$ M_r 201.2

DEFINITION

Acesulfame potassium contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of potassium 6-methyl-1,2,3-oxathiazin-4-olate 2,2-dioxide, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, soluble in water, very slightly soluble in acetone and in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *acesulfame potassium CRS*. Examine the substances prepared as discs.
- B. Examine by thin-layer chromatography (2.2.27), using *cellulose for chromatography R* as the coating substance.

Test solution. Dissolve 5 mg of the substance to be examined in *water R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *acesulfame potassium CRS* in *water R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *acesulfame potassium CRS* and 5 mg of *saccharin sodium R* in *water R* and dilute to 5 ml with the same solvent.

Apply to the plate as bands 5 μl of each solution. Develop twice over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 60 volumes of *acetone R* and 60 volumes of *ethyl acetate R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. The principal band in the chromatogram obtained with the test solution is similar in position and size to the principal band in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated bands.

- C. 0.5 ml of solution S (see Tests) gives reaction (b) of potassium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 20 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Acetylacetamide. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 0.80 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *acetylacetamide R* in *water R* and dilute to 25 ml with the same solvent. To 5 ml of the solution add 45 ml of *water R* and dilute to 100 ml with *methanol R*.

Reference solution (b). To 10 ml of reference solution (a) add 1 ml of the test solution and dilute to 20 ml with *methanol R*.

Apply separately to the plate 5 μl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *water R*, 15 volumes of *alcohol R* and 74 volumes of *ethyl acetate R*. Allow the plate to dry in air until the solvents are completely removed. Spray the plate with *vanillin phosphoric solution R* and heat at 120 °C for about 10 min. Examine in daylight. Any spot corresponding to acetylacetamide in the chromatogram obtained with the test solution, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.125 per cent). The test is not valid unless the chromatogram obtained with reference solution (a) shows a clearly visible spot and the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Impurity B and related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 20.0 mg of *acesulfame potassium impurity B CRS* in *water R* and dilute to 500.0 ml with the same solvent. Dilute 0.5 ml of this solution to 100.0 ml with *water R*.

Reference solution (b). Dissolve 10.0 mg of *acesulfame potassium impurity B CRS* and 10.0 mg of *acesulfame potassium CRS* in *water R* and dilute to 500.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 40 volumes of *acetonitrile R* and 60 volumes of a 3.3 g/l solution of *tetrabutylammonium hydrogen sulphate R*,
- as detector a spectrophotometer set at 234 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the two principal peaks is at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the two peaks due to acesulfame and impurity B is at least 3.0.

Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography of the test solution for at least three times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (20 ppm).

Fluorides. Not more than 3 ppm of F, determined potentiometrically (2.2.36, *Method I*) using as indicator electrode a fluoride selective-membrane electrode and as reference electrode a silver-silver chloride electrode.

Test solution. Dissolve 3.000 g of the substance to be examined in *distilled water R*, add 15.0 ml of *total ionic strength adjustment buffer R1* and dilute to 50.0 ml with *distilled water R*.

Reference solutions. To 0.5 ml, 1.0 ml, 1.5 ml and 3.0 ml of *fluoride standard solution (10 ppm F) R* add 15.0 ml of *total ionic strength adjustment buffer R1* and dilute to 50.0 ml with *distilled water R*.

Carry out the measurements of each solution.

Heavy metals (2.4.8). 12 ml of solution S complies with the limit test A for heavy metals (5 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 3 h.

ASSAY

Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 20.12 mg of C₄H₆N₄O₃S₂.

IMPURITIES

A. 3-oxobutanamide (acetylacetamide),

B. 5-chloro-6-methyl-1,2,3-oxathiazin-4(3*H*)-one 2,2-dioxide.

01/2005:0454

ACETAZOLAMIDE

Acetazolamidum

C₄H₆N₄O₃S₂

*M*_r 222.2

DEFINITION

Acetazolamide contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of *N*-(5-sulphamoyl-1,3,4-thiadiazol-2-yl)acetamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, slightly soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- Dissolve 30.0 mg in 0.01 M *sodium hydroxide* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with 0.01 M *sodium hydroxide* (solution A). Examined between 230 nm and 260 nm (2.2.25), solution A shows an absorption maximum at 240 nm. The specific absorbance at the maximum is 162 to 176. Dilute 25.0 ml of solution A to 100.0 ml with 0.01 M *sodium hydroxide*. Examined between 260 nm and 350 nm, the solution shows an absorption maximum at 292 nm. The specific absorbance at the maximum is 570 to 620.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *acetazolamide CRS*. If the spectra obtained in the solid state with the substance to be examined and the reference substance show differences, dissolve separately the substance to be examined and the reference substance in *alcohol R*, evaporate to dryness, prepare new discs and record the spectra.
- Introduce about 20 mg into a test-tube and add 4 ml of *dilute hydrochloric acid R* and 0.2 g of *zinc powder R*. Immediately place a piece of *lead acetate paper R* over the mouth of the tube. The paper shows a brownish-black colour.
- Dissolve about 25 mg in a mixture of 0.1 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. Add 0.1 ml of *copper sulphate solution R*. A greenish-blue precipitate is formed.

TESTS

Appearance of solution. Dissolve 1.0 g in 10 ml of 1 M sodium hydroxide. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution Y₅ or BY₅ (2.2.2, Method II).

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel GF₂₅₄ R as the coating substance.

Test solution. Dissolve 50 mg of the substance to be examined in a mixture of equal volumes of alcohol R and ethyl acetate R and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dilute 1 ml of the test solution to 100 ml with a mixture of equal volumes of alcohol R and ethyl acetate R.

Apply separately to the plate 20 µl of each solution. Use the tank without lining the walls and allow to saturate for 1 h before development. Develop over a path of 15 cm using a freshly prepared mixture of 20 volumes of concentrated ammonia R, 30 volumes of ethyl acetate R and 50 volumes of 2-propanol R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (1 per cent).

Sulphates (2.4.13). To 0.4 g add 20 ml of distilled water R and dissolve by heating to boiling. Allow to cool with frequent shaking and filter. 15 ml of the filtrate complies with the limit test for sulphates (500 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 25 ml of dimethylformamide R. Titrate with 0.1 M ethanolic sodium hydroxide, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M ethanolic sodium hydroxide is equivalent to 22.22 mg of C₄H₆N₄O₃S₂.

IDENTIFICATION

A. A 100 g/l solution is strongly acid (2.2.4).

B. To 0.03 ml add 3 ml of water R and neutralise with dilute sodium hydroxide solution R. The solution gives reaction (b) of acetates (2.3.1).

TESTS

Solution S. Dilute 20 ml to 100 ml with distilled water R.

Appearance. It is clear (2.2.1) and colourless (2.2.2, Method II).

Freezing point (2.2.18). Not less than 14.8 °C.

Reducing substances. To 5.0 ml add 10.0 ml of water R and mix. To 5.0 ml of the solution add 6 ml of sulphuric acid R, cool and add 2.0 ml of 0.0167 M potassium dichromate. Allow to stand for 1 min and add 25 ml of water R and 1 ml of a freshly prepared 100 g/l solution of potassium iodide R. Titrate with 0.1 M sodium thiosulphate, using 1.0 ml of starch solution R as indicator. Not less than 1.0 ml of 0.1 M sodium thiosulphate solution is required.

Chlorides (2.4.4). 10 ml of solution S diluted to 15 ml with water R complies with the limit test for chlorides (25 mg/l).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (50 mg/l).

Iron (2.4.9). 5.0 ml of solution (a) obtained in the test for heavy metals diluted to 10.0 ml with water R complies with the limit test for iron (5 ppm).

Heavy metals (2.4.8). Dissolve the residue obtained in the test for residue on evaporation by heating with two quantities, each of 15 ml, of water R and dilute to 50.0 ml (solution (a)). 12 ml of solution (a) complies with limit test A for heavy metals (5 ppm). Prepare the standard using lead standard solution (2 ppm Pb) R.

Residue on evaporation. Evaporate 20 g to dryness on a water-bath and dry at 100 °C to 105 °C. The residue weighs not more than 2.0 mg (0.01 per cent).

ASSAY

Weigh accurately a conical flask with a ground-glass stopper containing 25 ml of water R. Add 1.0 ml of the substance to be examined and weigh again accurately. Add 0.5 ml of phenolphthalein solution R and titrate with 1 M sodium hydroxide.

1 ml of 1 M sodium hydroxide is equivalent to 60.1 mg of C₂H₄O₂.

STORAGE

Store in an airtight container.

01/2005:0590

ACETIC ACID, GLACIAL

Acidum aceticum glaciale

C₂H₄O₂M_r 60.1

DEFINITION

Glacial acetic acid contains not less than 99.0 per cent *m/m* and not more than the equivalent of 100.5 per cent *m/m* of C₂H₄O₂.

CHARACTERS

A crystalline mass or a clear, colourless, volatile liquid, miscible with water, with alcohol and with methylene chloride.

01/2005:0872

ACETONE

Acetonum

C₃H₆OM_r 58.08

DEFINITION

Acetone is propan-2-one.

CHARACTERS

A volatile clear, colourless liquid, miscible with water and with alcohol. The vapour is flammable.

IDENTIFICATION

- A. To 1 ml, add 3 ml of *dilute sodium hydroxide solution R* and 0.3 ml of a 25 g/l solution of *sodium nitroprusside R*. An intense red colour is produced which becomes violet with the addition of 3.5 ml of *acetic acid R*.
- B. To 10 ml of a 0.1 per cent V/V solution in *alcohol (50 per cent V/V) R*, add 1 ml of a 10 g/l solution of *nitrobenzaldehyde R* in the same solvent and 0.5 ml of *strong sodium hydroxide solution R*. Allow to stand for about 2 min and acidify with *acetic acid R*. A greenish-blue colour is produced.

TESTS

Appearance of solution. To 10 ml add 10 ml of *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 5 ml add 5 ml of *carbon dioxide-free water R*, 0.15 ml of *phenolphthalein solution R* and 0.5 ml of 0.01 M *sodium hydroxide*. The solution is pink. Add 0.7 ml of 0.01 M *hydrochloric acid* and 0.05 ml of *methyl red solution R*. The solution is red or orange.

Relative density (2.2.5). 0.790 to 0.793.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. The substance to be examined.

Reference solution. To 0.5 ml of *methanol R* add 0.5 ml of *2-propanol R* and dilute to 100.0 ml with the test solution. Dilute 1.0 ml to 10.0 ml with the test solution.

The chromatographic procedure may be carried out using:

- a fused-silica column 50 m long and 0.3 mm in internal diameter coated with a film (0.5 µm) of *macrogol 20 000 R*,
- *helium for chromatography R* as the carrier gas with a split ratio of about 50:1 and at a linear flow of 21 cm/s,
- a flame-ionisation detector,

maintaining the temperature of the column at 45 °C until injection, then raising the temperature at a rate of 5 °C per minute to 100 °C and maintaining the temperature of the injection port at 150 °C and that of the detector at 250 °C.

Inject 1 µl of the test solution and 1 µl of the reference solution.

When the chromatograms are recorded in the conditions described above, the substances are eluted in the following order: acetone, methanol, 2-propanol.

Continue the chromatography for three times the retention time of acetone (which is about 5.3 min).

The test is not valid unless, in the chromatogram obtained with the reference solution, the resolution between the peaks corresponding to methanol and 2-propanol is at least 1.0.

In the chromatogram obtained with the test solution: the area of any peak corresponding to methanol or 2-propanol is not greater than the difference between the areas of the corresponding peaks in the chromatogram obtained with the reference solution and the areas of the corresponding peaks in the chromatogram obtained with the test solution (0.05 per cent V/V for each impurity); the area of any peak, apart from the principal peak and any peaks corresponding to methanol and 2-propanol, is not greater than the difference between the area of the methanol peak in the chromatogram obtained with the reference solution and the area of the corresponding peak in the chromatogram obtained with the test solution (0.05 per cent V/V for each of the additional impurities).

Matter insoluble in water. To 1 ml add 19 ml of *water R*. The solution is clear (2.2.1).

Reducing substances. To 30 ml add 0.1 ml of 0.02 M *potassium permanganate* and allow to stand in the dark for 2 h. The mixture is not completely decolourised.

Residue on evaporation. Evaporate 20.0 g to dryness on a water-bath and dry at 100 °C to 105 °C. The residue weighs not more than 1 mg (50 ppm).

Water (2.5.12). Not more than 3 g/l, determined on 10.0 ml by the semi-micro determination of water. Use 20 ml of *anhydrous pyridine R* as solvent.

STORAGE

Store protected from light.

IMPURITIES

- A. CH₃-OH: methanol,
B. propan-2-ol.

01/2005:1485
corrected

ACETYLCHOLINE CHLORIDE

Acetylcholini chloridum

C₇H₁₆ClNO₂

M_r 181.7

DEFINITION

2-(Acetyloxy)-N,N,N-trimethylethanaminium chloride.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white crystalline powder or colourless crystals, very hygroscopic.

Solubility: very soluble in water, freely soluble in alcohol, slightly soluble in methylene chloride.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Melting point (2.2.14): 149 °C to 152 °C.

Introduce the substance to be examined into a capillary tube. Dry in an oven at 100-105 °C for 3 h. Seal the tube and determine the melting point.

- B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *acetylcholine chloride CRS*.

- C. Examine the chromatograms obtained in the test for related substances.

Results: the principal band in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal band in the chromatogram obtained with reference solution (b).

- D. To 15 mg add 10 ml of *dilute sodium hydroxide solution R*, 2 ml of 0.02 M *potassium permanganate* and heat. The vapours formed change the colour of *red litmus paper R* to blue.

- E. 0.5 ml of solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ or BY₆ (2.2.2, Method II).

Acidity. Dilute 1 ml of solution S to 10 ml with *carbon dioxide-free water R*. Add 0.05 ml of *phenolphthalein solution R*. Not more than 0.4 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Related substances. Thin-layer chromatography (2.2.27). Prepare the solutions immediately before use.

Test solution (a). Dissolve 0.30 g of the substance to be examined in *methanol R* and dilute to 3.0 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dilute 1 ml of test solution (a) to 100 ml with *methanol R*.

Reference solution (b). Dissolve 20.0 mg of *acetylcholine chloride CRS* in *methanol R* and dilute to 2.0 ml with the same solvent.

Reference solution (c). Dissolve 20 mg of *choline chloride R* in *methanol R*, add 0.4 ml of test solution (a) and dilute to 2.0 ml with *methanol R*.

Plate: TLC silica gel plate R.

Mobile phase: mix 20 volumes of a 40 g/l solution of *ammonium nitrate R*, 20 volumes of *methanol R* and 60 volumes of *acetonitrile R*.

Application: 5 µl as bands of 10 mm by 2 mm.

Development: over 2/3 of the plate.

Detection: spray with *potassium iodobismuthate solution R3*.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated bands.

Limits:

- **any impurity:** any bands in the chromatogram obtained with test solution (a), apart from the principal band, are not more intense than the principal band in the chromatogram obtained with reference solution (a) (1 per cent).

Trimethylamine. Dissolve 0.1 g in 10 ml of *sodium carbonate solution R* and heat to boiling. No vapours appear which turn *red litmus paper R* blue.

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Dissolve 0.200 g in 20 ml of *carbon dioxide-free water R*. Neutralise with 0.01 M *sodium hydroxide* using 0.15 ml of *phenolphthalein solution R* as indicator. Add 20.0 ml of 0.1 M *sodium hydroxide* and allow to stand for 30 min. Titrate with 0.1 M *hydrochloric acid*.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 18.17 mg of C₇H₁₆ClNO₂.

STORAGE

In ampoules, protected from light.

IMPURITIES

A. 2-hydroxy-*N,N,N*-trimethylethanaminium chloride (choline chloride),

B. 2-(acetoxy)-*N,N*-dimethylethanaminium chloride,

C. *N,N*-dimethylmethanamine.

01/2005:0967
corrected

ACETYLCYSTEINE

Acetylcysteinum

C₅H₉NO₃S

M_r 163.2

DEFINITION

Acetylcysteine contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (2*R*)-2-(acetylamino)-3-sulfanylpropanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water and in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

- It complies with the test for specific optical rotation (see Tests).
- Melting point (2.2.14): 104 °C to 110 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *acetylcysteine CRS*. Examine the substances prepared as discs using *potassium bromide R*.
- Examine the chromatograms obtained in the test for related substances. The retention time and size of the principal peak in the chromatogram obtained with test solution (b) are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (b).
- To 0.5 ml of solution S (see Tests) add 0.05 ml of a 50 g/l solution of *sodium nitroprusside R* and 0.05 ml of *concentrated ammonia R*. A dark violet colour develops.

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3). To 2 ml of solution S add 8 ml of *carbon dioxide-free water R* and mix. The pH of the solution is 2.0 to 2.8.

Specific optical rotation (2.2.7). In a 25 ml volumetric flask, mix 1.25 g with 1 ml of a 10 g/l solution of *sodium edetate R*. Add 7.5 ml of a 40 g/l solution of *sodium hydroxide R*, mix and dissolve. Dilute to 25.0 ml with *phosphate buffer solution pH 7.0 R2*. The specific optical rotation is + 21.0 to + 27.0, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29). *Except where otherwise prescribed, prepare the solutions immediately before use.*

Test solution (a). Suspend 0.80 g of the substance to be examined in 1 ml of 1 M *hydrochloric acid* and dilute to 100.0 ml with *water R*.

Test solution (b). Dilute 5.0 ml of test solution (a) to 100.0 ml with *water R*. Dilute 5.0 ml of the solution to 50.0 ml with *water R*.

Test solution (c). Use test solution (a) after storage for at least 1 h.

Reference solution (a). Suspend 4.0 mg of *acetylcysteine CRS*, 4.0 mg of *L-cystine R*, 4.0 mg of *L-cysteine R*, 4.0 mg of *acetylcysteine impurity C CRS* and 4.0 mg of *acetylcysteine impurity D CRS* in 1 ml of 1 M *hydrochloric acid* and dilute to 100.0 ml with *water R*.

Reference solution (b). Suspend 4.0 mg of *acetylcysteine CRS* in 1 ml of 1 M *hydrochloric acid* and dilute to 100.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate at 1.0 ml/min a mixture prepared as follows: stir 3 volumes of *acetonitrile R* and 97 volumes of *water R* in a beaker; adjust to pH 3.0 with *phosphoric acid R*,
- as detector a spectrophotometer set at 220 nm.

When the chromatograms are recorded in the prescribed conditions, the retention times are: *L-cystine*, about 2.2 min; *L-cysteine*, about 2.4 min; 2-methyl-2-thiazoline-4-carboxylic acid, originating in test solution (c), about 3.3 min; *acetylcysteine*, about 6.4 min; *acetylcysteine impurity C*, about 12 min; *acetylcysteine impurity D*, about 14 min. Inject 20 µl of reference solution (a). The test is not valid unless:

- in the chromatogram obtained with reference solution (a), the resolution between the peaks due to *L-cystine* and *L-cysteine* is at least 1.5,
- in the chromatogram obtained with reference solution (a), the resolution between the peaks due to *acetylcysteine impurity C* and *acetylcysteine impurity D* is at least 2.0.

Inject 20 µl of 0.01 M *hydrochloric acid* as a blank. Inject three times 20 µl of reference solution (a), 20 µl of reference solution (b) and 20 µl of each test solution. Continue the chromatography for five times the retention time of *acetylcysteine* which is about 30 min.

From the chromatogram obtained with test solution (a), calculate the percentage content of the known impurities and the unknown impurities using the following expressions:

$$\text{known impurity} = \frac{A_1 \times m_2 \times 100}{A_2 \times m_1}$$

$$\text{unknown impurity} = \frac{A_3 \times m_3 \times 100}{A_4 \times m_1}$$

A_1 = peak area of individual impurity (*L-cystine*, *L-cysteine*, *acetylcysteine impurity C* and *acetylcysteine impurity D*) in the chromatogram obtained with test solution (a),

A_2 = peak area of the corresponding individual impurity (*L-cystine*, *L-cysteine*, *acetylcysteine impurity C* and *acetylcysteine impurity D*) in the chromatogram obtained with reference solution (a),

A_3 = peak area of unknown impurity in the chromatogram obtained with test solution (a),

A_4 = peak area of *acetylcysteine* in the chromatogram obtained with reference solution (b),

m_1 = mass of the substance to be examined in test solution (a),

m_2 = mass of the individual impurity in reference solution (a),

m_3 = mass of *acetylcysteine* in reference solution (b).

The percentage content of each known impurity and of each unknown impurity is not greater than 0.5 per cent. The sum of the calculated percentage contents of known and unknown impurities is not greater than 0.5 per cent. Disregard any peak due to the solvent, any peak appearing at retention time of about 3.3 min corresponding to 2-methyl-2-thiazoline-4-carboxylic acid and any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard (10 ppm Pb) R*.

Zinc. Not more than 10 ppm of Zn, determined by atomic absorption spectrometry (2.2.23, Method II).

Test solution. Dissolve 1.00 g in 0.001 M *hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solutions. Prepare the reference solutions using *zinc standard solution (5 mg/ml Zn) R*, diluted with 0.001 M *hydrochloric acid*.

Measure the absorbance at 213.8 nm using a zinc hollow-cathode lamp as the source of radiation, an air-acetylene flame and a correction procedure for non-specific absorption.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 70 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.140 g in 60 ml of *water R* and add 10 ml of *dilute hydrochloric acid R*. After cooling in iced water, add 10 ml of *potassium iodide solution R* and titrate with 0.05 M *iodine*, using 1 ml of *starch solution R* as indicator.

1 ml of 0.05 M *iodine* is equivalent to 16.32 mg of $\text{C}_5\text{H}_9\text{NO}_3\text{S}$.

STORAGE

Store protected from light.

IMPURITIES

A. *L-cystine*,

B. *L-cysteine*,

C. *N,N'*-diacetyl-L-cystine,D. *N,S*-diacetyl-L-cysteine.

01/2005:0309

ACETYLSALICYLIC ACID

Acidum acetylsalicylicum

 $C_9H_8O_4$ M_r 180.2**DEFINITION**

Acetylsalicylic acid contains not less than 99.5 per cent and not more than the equivalent of 101.0 per cent of 2-(acetoxy)benzoic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, slightly soluble in water, freely soluble in alcohol.

It melts at about 143 °C (instantaneous method).

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *acetylsalicylic acid CRS*.
- To 0.2 g add 4 ml of *dilute sodium hydroxide solution R* and boil for 3 min. Cool and add 5 ml of *dilute sulphuric acid R*. A crystalline precipitate is formed. Filter, wash the precipitate and dry at 100 °C to 105 °C. The melting point (2.2.14) is 156 °C to 161 °C.
- In a test tube mix 0.1 g with 0.5 g of *calcium hydroxide R*. Heat the mixture and expose to the fumes produced a piece of filter paper impregnated with 0.05 ml of *nitrobenzaldehyde solution R*. A greenish-blue or greenish-yellow colour develops on the paper. Moisten the paper with *dilute hydrochloric acid R*. The colour becomes blue.
- Dissolve with heating about 20 mg of the precipitate obtained in identification test B in 10 ml of *water R* and cool. The solution gives reaction (a) of salicylates (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in 9 ml of *alcohol R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 0.10 g of the substance to be examined in *acetonitrile for chromatography R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *salicylic acid R* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *salicylic acid R* in the mobile phase and dilute to 10.0 ml with the mobile phase. To 1.0 ml of this solution add 0.2 ml of the test solution and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 2 volumes of *phosphoric acid R*, 400 volumes of *acetonitrile for chromatography R* and 600 volumes of *water R*,
- as detector a spectrophotometer set at 237 nm.

Inject 10 µl of each solution. Continue the chromatography of the test solution for seven times the retention time of acetylsalicylic acid. The test is not valid unless in the chromatogram obtained with reference solution (b), the resolution between the two principal peaks is at least 6.0.

In the chromatogram obtained with the test solution the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); the sum of the areas of all the peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent). Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). Dissolve 1.0 g in 12 ml of *acetone R* and dilute to 20 ml with *water R*. 12 ml of this solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 6 volumes of *water R* and 9 volumes of *acetone R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In a flask with a ground-glass stopper, dissolve 1.000 g in 10 ml of *alcohol R*. Add 50.0 ml of 0.5 M *sodium hydroxide*. Close the flask and allow to stand for 1 h. Using 0.2 ml of *phenolphthalein solution R* as indicator, titrate with 0.5 M *hydrochloric acid*. Carry out a blank titration.

1 ml of 0.5 M *sodium hydroxide* is equivalent to 45.04 mg of $C_9H_8O_4$.

STORAGE

Store in an airtight container.

IMPURITIES

- A. R = H: 4-hydroxybenzoic acid,
 B. R = CO₂H: 4-hydroxybenzene-1,3-dicarboxylic acid
 (4-hydroxyisophthalic acid),

- C. salicylic acid,

- D. R = O-CO-CH₃: 2-[[2-(acetyloxy)benzoyl]oxy]benzoic acid
 (acetylsalicylsalicylic acid),

- E. R = OH: 2-[(2-hydroxybenzoyl)oxy]benzoic acid
 (salicylsalicylic acid),

- F. 2-(acetyloxy)benzoic anhydride (acetylsalicylic anhydride).

Second identification: A, C, D, E.

- A. It complies with the test for optical rotation (see Tests).
 B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *N*-acetyltryptophan CRS.

- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 50 mg of the substance to be examined in 0.2 ml of *concentrated ammonia R* and dilute to 10 ml with *water R*.

Reference solution (a). Dissolve 50 mg of *N*-acetyltryptophan CRS in 0.2 ml of *concentrated ammonia R* and dilute to 10 ml with *water R*.

Reference solution (b). Dissolve 10 mg of *tryptophan R* in the test solution and dilute to 2 ml with the same solution.

Apply to the plate 2 µl of each solution. Develop over a path of 10 cm using a mixture of 25 volumes of *glacial acetic acid R*, 25 volumes of *water R* and 50 volumes of *butanol R*. Dry the plate in an oven at 100-105 °C for 15 min and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. Dissolve about 2 mg in 2 ml of *water R*. Add 2 ml of *dimethylaminobenzaldehyde solution R6*. Heat on a water-bath. A blue or greenish-blue colour develops.
 E. It gives the reaction of acetyl (2.3.1). Proceed as described for substances hydrolysable only with difficulty.

TESTS

01/2005:1383

N-ACETYLTRYPTOPHAN*N*-AcetyltryptophanumC₁₃H₁₄N₂O₃M_r 246.3

DEFINITION

N-Acetyltryptophan contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (RS)-2-acetylamino-3-(1*H*-indol-3-yl)propanoic acid, calculated with reference to the dried substance.

PRODUCTION

Tryptophan used for the production of *N*-acetyltryptophan complies with the test for 1,1'-ethylidenebistryptophan and other related substances in the monograph on *Tryptophan* (1272).

CHARACTERS

A white or almost white, crystalline powder, or colourless crystals, slightly soluble in water, very soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

It melts at about 205 °C.

IDENTIFICATION

First identification: A, B.

Appearance of solution. Dissolve 1.0 g in a 40 g/l solution of *sodium hydroxide R* and dilute to 100 ml with the same alkaline solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ or GY₇ (2.2.2, *Method II*).

Optical rotation (2.2.7). Dissolve 2.50 g in a 40 g/l solution of *sodium hydroxide R* and dilute to 25.0 ml with the same alkaline solution. The angle of optical rotation is -0.1° to + 0.1°.

Related substances. Examine by liquid chromatography (2.2.29).

Buffer solution pH 2.3. Dissolve 3.90 g of *sodium dihydrogen phosphate R* in 1000 ml of *water R*. Add about 700 ml of a 2.9 g/l solution of *phosphoric acid R* and adjust the pH to 2.3 with the same acidic solution.

Prepare the solutions immediately before use.

Test solution. Dissolve 0.10 g of the substance to be examined in a mixture of 50 volumes of *acetonitrile R* and 50 volumes of *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R*.

Reference solution (b). Dissolve 1.0 mg of 1,1'-ethylidenebis(*tryptophan*) CRS in a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (c). To 4.0 ml of reference solution (a), add 20.0 ml of reference solution (b) and dilute to 100.0 ml with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 0.7 ml/min:

Mobile phase A. A mixture of 115 volumes of *acetonitrile R* and 885 volumes of buffer solution pH 2.3,

Mobile phase B. A mixture of 350 volumes of *acetonitrile R* and 650 volumes of buffer solution pH 2.3,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
	100	0	equilibration
0 - 10	100	0	isocratic
10 - 45	100 → 0	0 → 100	linear gradient
45 - 65	0	100	isocratic
65 - 66	0 → 100	100 → 0	linear gradient
66 - 80	100	0	re-equilibration

- as detector a spectrophotometer set at 220 nm, maintaining the temperature of the column at 40 °C.

When the chromatograms are recorded in the prescribed conditions, the retention times are about 29 min for *N*-acetyltryptophan and about 34 min for 1,1'-ethyldienebis(tryptophan). Adjust the sensitivity of the system so that the height of the peak due to *N*-acetyltryptophan in the chromatogram obtained with reference solution (a) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (c). The test is not valid unless in the chromatogram obtained, the resolution between the peaks corresponding to *N*-acetyltryptophan and 1,1'-ethyldienebis(tryptophan) is at least 8.0. If necessary, adjust the time programme for the elution gradient. An increase in the duration of elution with mobile phase A produces longer retention times and a better resolution.

Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography of the test solution for 1.8 times the retention time of *N*-acetyltryptophan. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.01 times that of the peak due to *N*-acetyltryptophan in the chromatogram obtained with reference solution (a).

Ammonium (2.4.1). 0.10 g complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.2 ml of *ammonium standard solution* (100 ppm NH₄) *R*.

Iron (2.4.9). Dissolve 1.0 g in 50 ml of *hydrochloric acid R1*, with heating at 50 °C. Allow to cool. In a separating funnel, shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 5 ml of *methanol R*. Add 50 ml of *ethanol R*. Titrate with 0.1 *M* sodium hydroxide, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* sodium hydroxide is equivalent to 24.63 mg of C₁₃H₁₄N₂O₃.

STORAGE

Store protected from light.

IMPURITIES

A. tryptophan,

B. (S)-2-amino-3-[(3*RS*)-3-hydroxy-2-oxo-2,3-dihydro-1*H*-indol-3-yl]propanoic acid (dioxindolylalanine),

C. R = H: (S)-2-amino-4-(2-aminophenyl)-4-oxobutanoic acid (kynurenine),

E. R = CHO: (S)-2-amino-4-[2-(formylamino)phenyl]-4-oxobutanoic acid (*N*-formylkynurenine),

D. (S)-2-amino-3-(5-hydroxy-1*H*-indol-3-yl)propanoic acid (5-hydroxytryptophan),

F. (S)-2-amino-3-(phenylamino)propanoic acid (3-phenylaminoalanine),

G. (S)-2-amino-3-(2-hydroxy-1*H*-indol-3-yl)propanoic acid (2-hydroxytryptophan),

- H. R = H: (3*RS*)-1,2,3,4-tetrahydro-9*H*-β-carboline-3-carboxylic acid,
 I. R = CH₃: 1-methyl-1,2,3,4-tetrahydro-9*H*-β-carboline-3-carboxylic acid,

- J. R = CHOH-CH₂-OH: (S)-2-amino-3-[2-[2,3-dihydroxy-1-(1*H*-indol-3-yl)propyl]-1*H*-indol-3-yl]propanoic acid,
 K. R = H: (S)-2-amino-3-[2-(1*H*-indol-3-ylmethyl)-1*H*-indol-3-yl]propanoic acid,

- L. 1-(1*H*-indol-3-ylmethyl)-1,2,3,4-tetrahydro-9*H*-β-carboline-3-carboxylic acid.

01/2005:1384

N-ACETYLTYROSINE

N-Acetyltyrosinum

C₁₁H₁₃NO₄M_r 223.2

DEFINITION

N-Acetyltyrosine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2*S*)-2-(acetylamino)-3-(4-hydroxyphenyl)propanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, practically insoluble in cyclohexane.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. It complies with the test for specific optical rotation (see Tests).

- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *N*-acetyltyrosine CRS. Examine the substances prepared as discs.
 C. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
 D. Solution S (see Tests) is strongly acid (2.2.4).

TESTS

Solution S. Dissolve 2.50 g in *water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dilute 10.0 ml of solution S to 25.0 ml with *water R*. The specific optical rotation is + 46 to + 49, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄* plate *R*.

Test solution (a). Dissolve 0.80 g of the substance to be examined in 6 ml of a mixture of equal volumes of *glacial acetic acid R* and *water R* and dilute to 10 ml with *ethanol R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *ethanol R*.

Reference solution (a). Dissolve 80 mg of *N*-acetyltyrosine CRS in a mixture of 3 volumes of *water R*, 3 volumes of *glacial acetic acid R* and 94 volumes of *ethanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dilute 0.5 ml of test solution (b) to 10 ml with *ethanol R*.

Reference solution (c). Dissolve 40 mg of *tyrosine CRS* in 20 ml of a mixture of equal volumes of *water R* and *glacial acetic acid R* and dilute to 50 ml with *ethanol R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *water R*, 15 volumes of *glacial acetic acid R* and 75 volumes of *ethyl acetate R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 10 min. Examine in daylight. Any spot corresponding to tyrosine is not more intense than the spot in the chromatogram obtained with reference solution (c) (1 per cent).

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dissolve 1.0 g in *distilled water R* and dilute to 20 ml with the same solvent. The solution complies with the limit test for sulphates (200 ppm).

Ammonium. Prepare a cell consisting of two watch-glasses 60 mm in diameter placed edge to edge. To the inner wall of the upper watch-glass stick a piece of *red litmus paper R* 5 mm square and wetted with a few drops of *water R*. Finely powder the substance to be examined, place 50 mg in the lower watch-glass and dissolve in 0.5 ml of *water R*. To the solution add 0.30 g of *heavy magnesium oxide R*. Briefly triturate with a glass rod. Immediately close the cell by putting the two watch-glasses together. Heat at 40 °C for 15 min. The litmus paper is not more intensely blue

coloured than a standard prepared at the same time and in the same manner using 0.1 ml of *ammonium standard solution* (100 ppm NH_4) *R*, 0.5 ml of *water R* and 0.30 g of *heavy magnesium oxide R* (200 ppm).

Iron (2.4.9). In a separating funnel, dissolve 0.5 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

Pyrogens (2.6.8). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1.0 ml of a freshly prepared solution in *water for injections R* containing per millilitre 10.0 mg of the substance to be examined and 9.0 mg of pyrogen-free *sodium chloride R*.

ASSAY

Dissolve 0.180 g in 50 ml of *carbon dioxide-free water R*. Titrate with 0.1 *M sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M sodium hydroxide* is equivalent to 22.32 mg of $\text{C}_{11}\text{H}_{13}\text{NO}_4$.

STORAGE

Store protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is apyrogenic.

IMPURITIES

A. tyrosine,

B. (2*S*)-2-(acetylamino)-3-[4-(acetoxyphe-nyl)]propanoic acid (diacetyltyrosine).

01/2005:0968

ACICLOVIR

Aciclovirum

$\text{C}_8\text{H}_{11}\text{N}_5\text{O}_3$

M_r 225.2

DEFINITION

Aciclovir contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 2-amino-9-[(2-hydroxyethoxy)methyl]-1,9-dihydro-6*H*-purin-6-one, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, freely soluble in dimethyl sulphoxide, very slightly soluble in alcohol. It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *aciclovir CRS*.

TESTS

Appearance of solution. Dissolve 0.25 g in 0.1 *M sodium hydroxide* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_7 (2.2.2, *Method II*).

Related substances.

A. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Prepare the solutions immediately before use.

Test solution. Dissolve 0.1 g of the substance to be examined in *dimethyl sulphoxide R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *aciclovir impurity A CRS* in *dimethyl sulphoxide R* and dilute to 20 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *dimethyl sulphoxide R*.

Apply to the plate 10 µl of each solution. Keep the spots compact by drying in a current of warm air. Allow the plate to cool and develop over a path of 10 cm with a mixture of 2 volumes of *concentrated ammonia R*, 20 volumes of *methanol R* and 80 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any spot with an R_f value greater than that of the principal spot is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

B. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in 10 ml of a mixture of 20 volumes of *glacial acetic acid R* and 80 volumes of *water R* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *aciclovir CRS* and 20 mg of *aciclovir impurity A CRS* in a mixture of 20 volumes of *glacial acetic acid R* and 80 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 7 mg of *guanine R* in 0.1 *M sodium hydroxide* and dilute to 100.0 ml with the same solution. Dilute 1.0 ml to 20.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.10 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture prepared as follows: dissolve 6.0 g of *sodium dihydrogen phosphate R* and 1.0 g of *sodium decanesulphonate R* in 900 ml of *water R* and adjust to pH 3 ± 0.1 with *phosphoric acid R*; add 40 ml of *acetonitrile R* and dilute to 1 litre with *water R*,
- as detector a spectrophotometer set at 254 nm,
- a loop injector.

Inject 20 µl of each solution. Record the chromatograms for seven times the retention time of aciclovir. The test is not valid unless in the chromatogram obtained with reference solution (b), the number of theoretical plates calculated for the peak due to aciclovir impurity A is at least 1500 and its mass distribution ratio is at least 7 (V_0 can be calculated using *dimethyl sulfoxide R*). In the chromatogram obtained with the test solution: the area of any peak corresponding to guanine is not greater than that of the peak in the chromatogram obtained with reference solution (c) (0.7 per cent); the area of any peak apart from the principal peak and any peak corresponding to guanine is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of such peaks is not greater than twice the area of the peak in the chromatogram obtained with reference solution (a) (1 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (a).

Water (2.5.12). Not more than 6.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 60 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *perchloric acid* is equivalent to 22.52 mg of $C_8H_{11}N_5O_3$.

IMPURITIES

- A. R = CH_3 : 2-[(2-amino-6-oxo-1,6-dihydro-9H-purin-9-yl)methoxy]ethyl acetate,
- D. R = C_6H_5 : 2-[(2-amino-6-oxo-1,6-dihydro-9H-purin-9-yl)methoxy]ethyl benzoate,

- B. R = H: 2-amino-1,7-dihydro-6H-purin-6-one (guanine),
- C. R = $CH_2OCH_2CH_2OH$: 2-amino-7-[(2-hydroxyethoxy)methyl]-1,7-dihydro-6H-purin-6-one,

- E. 6-amino-9-[(2-hydroxyethoxy)methyl]-1,9-dihydro-2H-purin-2-one,

- F. R = H: *N*-[9-[(2-hydroxyethoxy)methyl]-6-oxo-6,9-dihydro-1H-purin-2-yl]acetamide,
- G. R = $CO-CH_3$: 2-[[2-(acetylamino)-6-oxo-1,6-dihydro-9H-purin-9-yl]methoxy]ethyl acetate,
- H. R = $CO-C_6H_5$: 2-[[2-(acetylamino)-6-oxo-1,6-dihydro-9H-purin-9-yl]methoxy]ethyl benzoate.

corrected

ACITRETIN

Acitretinum

$C_{21}H_{26}O_3$

M_r 326.4

DEFINITION

Acitretin contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (all-*E*)-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoic acid, calculated with reference to the dried substance.

CHARACTERS

A yellow or greenish-yellow, crystalline powder, practically insoluble in water, sparingly soluble in tetrahydrofuran, slightly soluble in acetone and in alcohol, very slightly soluble in cyclohexane. It is sensitive to air, heat and light, especially in solution.

Carry out all operations as rapidly as possible and avoid exposure to actinic light; use freshly prepared solutions.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. Dissolve 15.0 mg in 10 ml of *tetrahydrofuran R* and dilute immediately to 100.0 ml with the same solvent. Dilute 2.5 ml of this solution to 100.0 ml with *tetrahydrofuran R*. Examined between 300 nm and 400 nm (2.2.25), the solution shows an absorption maximum at 358 nm. The specific absorbance at the maximum is 1350 to 1475.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *acitretin CRS*. Examine the substances prepared as discs.

- C. Examine the chromatograms obtained in the assay.
The principal peak in the chromatogram obtained with the test solution has a retention time similar to that of the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 10 µl each of reference solutions (b) and (c) and of the test solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is not less than 40 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks due to acitretin and tretinoin in the chromatogram obtained with reference solution (b) is at least 2.0. If necessary, adjust the concentration of *ethanol R*. Continue the chromatography of the test solution (a) for 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution (a), the area of any peak, apart from the principal peak, is not greater than the area of the peak due to acitretin in the chromatogram obtained with reference solution (c) (0.3 per cent); the sum of the areas of any peaks, apart from the principal peak, is not greater than the area of the peak due to acitretin in the chromatogram obtained with reference solution (b) (1.0 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (c).

Heavy metals (2.4.8). 2.0 g complies with limit test C (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Palladium. Not more than 10 ppm of Pd, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Introduce 2.0 g of the substance to be examined into a quartz beaker and add 3 ml of *magnesium nitrate solution R*. Heat in a muffle furnace to 350 °C at a rate of 40 °C/min to incinerate the content. Ignite at about 450 °C for 8 h and then at 550 °C for a further hour. Dissolve the residue in a mixture of 0.75 ml of *hydrochloric acid R* and 0.25 ml of *nitric acid R* warming gently. Cool, transfer the solution into a volumetric flask with *water R* and dilute to 50.0 ml with the same solvent.

Reference solution. Dissolve 0.163 g of *heavy magnesium oxide R* in a mixture of 0.5 ml of *nitric acid R*, 1.5 ml of *hydrochloric acid R* and 50 ml of *water R*, add 2.0 ml of *palladium standard solution* (20 ppm Pd *R*) and dilute to 100.0 ml with *water R*.

Measure the absorbance at 247.6 nm using a palladium hollow-cathode lamp as source of radiation and an air-acetylene flame.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 100 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the assay protected from light, use amber volumetric flasks and prepare the solutions immediately before use.

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 25.0 mg of the substance to be examined in 5 ml of *tetrahydrofuran R* and dilute immediately to 100.0 ml with *ethanol R*.

Test solution (b). Dilute 10.0 ml of test solution (a) to 25.0 ml with *ethanol R*.

Reference solution (a). Dissolve 25.0 mg of *acitretin CRS* in 5 ml of *tetrahydrofuran R* and dilute immediately to 100.0 ml with *ethanol R*. Dilute 10.0 ml to 25.0 ml with *ethanol R*.

Reference solution (b). Dissolve 1.0 mg of *tretinoin CRS* in *ethanol R* and dilute to 20.0 ml with the same solvent. Mix 5.0 ml of the solution with 2.5 ml of reference solution (a) and dilute to 100.0 ml with *ethanol R*.

Reference solution (c). Dilute 2.5 ml of reference solution (a) to 50.0 ml with *ethanol R*. Dilute 3.0 ml of the solution to 20.0 ml with *ethanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with microparticulate *octadecylsilyl silica gel for chromatography R* (5 µm), with a carbon loading of 20 per cent, a specific surface area of 200 m²/g and a pore size of 15 nm,
- as mobile phase at a flow rate of 0.6 ml/min a 0.3 per cent V/V solution of *glacial acetic acid R* in a mixture of 8 volumes of *water R* and 92 volumes of *ethanol R*,
- as detector a spectrophotometer set at 360 nm,
- a sampler kept at 4 °C,

maintaining the temperature of the column at 25 °C.

When the chromatograms are recorded in the prescribed conditions, the retention times are: impurity A about 4.8 min, tretinoin about 5.2 min, acitretin about 6.2 min and impurity B about 10.2 min.

Inject 10 µl of reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the peak area for acitretin is at most 1.0 per cent. If necessary, adjust the integration parameters. Inject alternately the test solution (b) and reference solution (a).

STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

It is recommended that the contents of an opened container be used as soon as possible and any unused part be protected by an atmosphere of inert gas.

IMPURITIES

A. (2Z,4E,6E,8E)-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoic acid,

B. ethyl (all-*E*)-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoate.

01/2005:2043

ACRIFLAVINIUM MONOCHLORIDE

Acriflavinii monochloridum

R	Mol. Formula	M_r
H	$C_{13}H_{12}ClN_3$	245.7
CH ₃	$C_{14}H_{14}ClN_3$	259.7

DEFINITION

Mixture of 3,6-diamino-10-methylacridinium chloride and 3,6-diaminoacridine hydrochloride.

Content: 95.0 per cent to 105.0 per cent (anhydrous substance).

CHARACTERS

Appearance: reddish-brown powder, hygroscopic.

Solubility: freely soluble in water, sparingly soluble in alcohol, very slightly soluble in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Dilute 0.5 ml of solution S (see Tests) to 10 ml with *alcohol R*.

Reference solution. Dissolve 10 mg of *acriflavinium monochloride CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: glacial acetic acid *R*, water *R*, butanol *R* (1:1:4 V/V/V).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: at 100-105 °C.

Detection: examine in ultraviolet light at 365 nm.

Results: the 2 principal spots in the chromatogram obtained with the test solution are similar in position, fluorescence and size to the principal spots in the chromatogram obtained with the reference solution.

B. To 0.1 mg add 20 ml of *water R*. The solution obtained shows a yellowish-green fluorescence. Add 1 ml of *dilute sodium hydroxide solution R*. The fluorescence disappears.

C. It complies with the test for pH (see Tests).

TESTS

Solution S. Dissolve with heating 0.500 g in 15 ml of *carbon dioxide-free water R*; allow to cool and dilute to 25.0 ml with the same solvent.

pH (2.2.3): 4.5 to 7.5 for solution S.

Composition. Liquid chromatography (2.2.29): use the normalisation procedure.

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: dissolve 1.0 g of *sodium octanesulphonate R* and 5 ml of *triethylamine R* in a mixture of 400 ml of *acetonitrile R* and 600 ml of *phosphate buffer solution pH 2.8 R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 262 nm.

Injection: 10 µl.

Run time: 30 min.

System suitability: reference solution (a):

- **resolution:** minimum 3.5 between the 2 principal peaks.

Limits:

- **first principal peak:** 30.0 per cent to 40.0 per cent,
- **second principal peak:** 50.0 per cent to 60.0 per cent,
- **any other peak:** maximum 6.0 per cent and not more than 2 such peaks have a peak area of more than 2.0 per cent,
- **disregard limit:** 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 40 ppm.

0.5 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 10.0 per cent, determined on 0.250 g.

Sulphated ash (2.4.14): maximum 3.5 per cent, determined on 1.0 g.

ASSAY

Prepare the solutions immediately before use and protected from light.

Determine the water content immediately before the assay.

Dissolve 0.100 g in 500.0 ml of *water R*. Dilute 5.0 ml of the solution to 250.0 ml with 0.1 M *hydrochloric acid*. Measure the absorbance (2.2.25) at the maximum at 262 nm.

Calculate the content of the sum of $C_{14}H_{14}ClN_3$ and $C_{13}H_{12}ClN_3$ taking the specific absorbance to be 1820.

STORAGE

In an airtight container, protected from light.

01/2005:0800

ADENINE

Adeninum

 $C_5H_5N_5$ M_r 135.1

DEFINITION

Adenine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 7H-purin-6-amine, calculated with reference to the dried substance.

CHARACTERS

A white powder, very slightly soluble in water and in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *adenine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- To 1 g add 3.5 ml of *propionic anhydride R* and boil for 15 min with stirring. Cool. To the resulting crystalline mass add 15 ml of *light petroleum R* and heat to boiling with vigorous stirring. Cool and filter. Wash the precipitate with two quantities, each of 5 ml, of *light petroleum R*. Dissolve the precipitate in 10 ml of *water R* and boil for 1 min. Filter the mixture at 30 °C to 40 °C. Allow to cool. Filter, and dry the precipitate at 100 °C to 105 °C for 1 h. The melting point (2.2.14) of the precipitate is 237 °C to 241 °C.

TESTS

Solution S. Suspend 2.5 g in 50 ml of *distilled water R* and boil for 3 min. Cool and dilute to 50 ml with *distilled water R*. Filter. Use the filtrate as solution S.

Appearance of solution. Dissolve 0.5 g in *dilute hydrochloric acid R* and dilute to 50 ml with the same acid. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is blue. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is yellow.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dilute acetic acid R*, with heating if necessary, and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *dilute acetic acid R*.

Reference solution (a). Dissolve 10 mg of *adenine CRS* in *dilute acetic acid R*, with heating if necessary, and dilute to 10 ml with the same acid.

Reference solution (b). Dilute 1 ml of test solution (b) to 20 ml with *dilute acetic acid R*.

Reference solution (c). Dissolve 10 mg of *adenine CRS* and 10 mg of *adenosine R* in *dilute acetic acid R*, with heating if necessary, and dilute to 10 ml with the same acid.

Apply to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *concentrated ammonia R*, 40 volumes of *ethyl acetate R* and 40 volumes of *propanol R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). To 10 ml of solution S add 1 ml of *concentrated ammonia R* and 3 ml of *silver nitrate solution R2*. Filter. Wash the precipitate with a little *water R*

and dilute the filtrate to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm). When carrying out the test, add 2 ml of *dilute nitric acid R* instead of 1 ml of *dilute nitric acid R*.

Sulphates (2.4.13). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium. Prepare a cell consisting of two watch-glasses 60 mm in diameter placed edge to edge. To the inner wall of the upper watch-glass stick a piece of *red litmus paper R* 5 mm square and wetted with a few drops of *water R*. Finely powder the substance to be examined, place 0.5 g in the lower watch-glass and suspend in 0.5 ml of *water R*. To the suspension add 0.30 g of *heavy magnesium oxide R*. Briefly triturate with a glass rod. Immediately close the cell by putting the two watch-glasses together. Heat at 40 °C for 15 min. The litmus paper is not more intensely blue coloured than a standard prepared at the same time and in the same manner using 0.05 ml of *ammonium standard solution* (100 ppm NH_4) *R*, 0.5 ml of *water R* and 0.30 g of *heavy magnesium oxide R* (10 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in a mixture of 20 ml of *acetic anhydride R* and 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 13.51 mg of $\text{C}_5\text{H}_5\text{N}_5$.

01/2005:1486

ADENOSINE

Adenosinum

 $\text{C}_{10}\text{H}_{13}\text{N}_5\text{O}_4$ M_r 267.2

DEFINITION

Adenosine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 9-β-D-ribofuranosyl-9H-purin-6-amine, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder slightly soluble in water, soluble in hot water, practically insoluble in alcohol and in methylene chloride. It dissolves in dilute mineral acids.

It melts at about 234 °C.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *adenosine CRS*.

TESTS

Solution S. Suspend 5.0 g in 100 ml of *distilled water R* and heat to boiling. Allow to cool, filter with the aid of vacuum and dilute to 100 ml with *distilled water R*.

Appearance of solution. Solution S is colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S, add 0.1 ml of *bromocresol purple solution R* and 0.1 ml of 0.01 M *hydrochloric acid*. The solution is yellow. Add 0.4 ml of 0.01 M *sodium hydroxide*, the solution is violet-blue.

Specific optical rotation (2.2.7). Dissolve 1.25 g in 1 M *hydrochloric acid* and dilute to 50.0 ml with the same acid. Determined within 10 min and calculated with reference to the dried substance, the specific optical rotation is -45 to -49 .

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 0.20 g of the substance to be examined in *dilute acetic acid R* with slight heating and dilute to 5 ml with the same acid.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *water R*.

Reference solution (b). Dissolve 10 mg of *adenosine CRS* and 10 mg of *adenine CRS* in *dilute acetic acid R*, with heating if necessary, and dilute to 10 ml with the same acid.

Apply to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *water R*, 30 volumes of *concentrated ammonia R* and 60 volumes of *propanol R*. Allow the plate to dry in a current of warm air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent). Spray with a 5 g/l solution of *potassium permanganate R* in 1 M *sodium hydroxide*. Allow the plate to dry in a current of warm air and examine in daylight. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (200 ppm).

Ammonium (2.4.1). 0.5 g complies with limit test B for ammonium (10 ppm). Prepare the standard using 5 ml of *ammonium standard solution* (1 ppm NH_4) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g, warming slightly if necessary, in a mixture of 20 ml of *acetic anhydride R* and 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 26.72 mg of $\text{C}_{10}\text{H}_{18}\text{N}_5\text{O}_4$.

IMPURITIES

A. adenine,

B. D-ribose,

C. R = H: adenosine 3'-(dihydrogen phosphate),

D. R = PO_3H_2 : adenosine 3'-(trihydrogen diphosphate),

E. R = $\text{PO}_2\text{H-O-PO}_3\text{H}_2$: adenosine 3'-(tetrahydrogen triphosphate).

01/2005:1586

ADIPIC ACID

Acidum adipicum

$\text{C}_6\text{H}_{10}\text{O}_4$

M_r 146.1

DEFINITION

Hexanedioic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: sparingly soluble in water, soluble in boiling water, freely soluble in alcohol and in methanol, soluble in acetone.

IDENTIFICATION

A. Melting point (2.2.14): 151 °C to 154 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *adipic acid CRS*.

TESTS

Solution S. Dissolve 5.0 g with heating in *distilled water R* and dilute to 50 ml with the same solvent. Allow to cool and to crystallise. Filter through a sintered-glass filter (40). Wash the filter with *distilled water R*. Collect the filtrate and the washings until a volume of 50 ml is obtained.

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dissolve 1.0 g in *methanol R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.20 g of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *glutaric acid R* in 1.0 ml of the test solution and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase, dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Column:

- **size:** $l = 0.125$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** spherical *octadecylsilyl silica gel for chromatography R* (5 μ m) with a specific surface area of 350 m²/g and a pore size of 10 nm,
- **temperature:** 30 °C.

Mobile phase: mix 3 volumes of *acetonitrile R* and 97 volumes of a 24.5 g/l solution of *dilute phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 209 nm.

Injection: 20 μ l.

Run time: 3 times the retention time of adipic acid.

System suitability: reference solution (a):

- **resolution:** minimum 9.0 between the peaks due to glutaric acid and adipic acid.

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (2.4.4): maximum 200 ppm.

2.5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides.

Nitrates: maximum 30 ppm.

To 1 ml of solution S add 2 ml of *concentrated ammonia R*, 0.5 ml of a 10 g/l solution of *manganese sulphate R*, 1 ml of a 10 g/l solution of *sulfanilamide R* and dilute to 20 ml with *water R*. Add 0.10 g of *zinc powder R* and cool in iced water for 30 min; shake from time to time. Filter and cool 10 ml of the filtrate in iced water. Add 2.5 ml of *hydrochloric acid R1* and 1 ml of a 10 g/l solution of *naphthylethylenediamine dihydrochloride R*. Allow to stand at room temperature. After 15 min the mixture is not more intensely coloured than a standard prepared at the same time and in the same manner, using 1.5 ml of *nitrate standard solution* (2 ppm NO₃) *R* instead of 1 ml of solution S. The test is invalid if a blank solution prepared at the same time and in the same manner, using 1 ml of *water R* instead of 1 ml of solution S, is more intensely coloured than a 2 mg/l solution of *potassium permanganate R*.

Sulphates (2.4.13): maximum 500 ppm.

3 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates.

Iron (2.4.9): maximum 10 ppm.

10 ml of solution S complies with the limit test for iron.

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.2 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent.

Melt 1.0 g completely over a gas burner, then ignite the melted substance with the burner. After ignition, lower or remove the flame in order to prevent the substance from boiling and keep it burning until completely carbonised. Carry out the test for sulphated ash using the residue.

ASSAY

Dissolve 60.0 mg in 50 ml of *water R*. Add 0.2 ml of *phenolphthalein solution R* and titrate with 0.1 M *sodium hydroxide*.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 7.31 mg of C₆H₁₀O₄.

IMPURITIES

A. R = CH₂-CO₂H: pentanedioic acid (glutaric acid),

B. R = CO₂H: butanedioic acid (succinic acid),

C. R = [CH₂]₃-CO₂H: heptanedioic acid (pimelic acid).

01/2005:0254

ADRENALINE TARTRATE

Adrenalini tartras

C₁₃H₁₉NO₉

*M*_r 333.3

DEFINITION

Adrenaline tartrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (1*R*)-1-(3,4-dihydroxyphenyl)-2-(methylamino)ethanol hydrogen (2*R*,3*R*)-2,3-dihydroxybutanedioate, calculated with reference to the dried substance.

CHARACTERS

A white or greyish-white, crystalline powder, freely soluble in water, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

- A. Dissolve 2 g in 20 ml of a 5 g/l solution of *sodium metabisulphite R* and make alkaline by addition of *ammonia R*. Keep the mixture in iced water for 1 h and filter. Reserve the filtrate for identification test C. Wash the precipitate with 3 quantities, each of 2 ml, of *water R*, with 5 ml of *ethanol* (96 per cent) *R* and finally with 5 ml of *ether R*. Dry *in vacuo* for 3 h. The specific optical rotation (2.2.7) of the precipitate (adrenaline base) is –50 to –54, determined using a 20.0 g/l solution in 0.5 M *hydrochloric acid*.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with adrenaline base prepared by the same method from a suitable amount of *adrenaline tartrate CRS*. Use adrenaline base prepared as described under identification test A. Examine the substances prepared as discs.

C. 0.2 ml of the filtrate obtained in identification test A gives reaction (b) of tartrates (2.3.1).

TESTS

Appearance of solution. Dissolve 0.5 g in *water R* and dilute to 10 ml with the same solvent. Examine the solution immediately. The solution is not more opalescent than reference suspension II (2.2.1) and is not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Adrenalone. Dissolve 50.0 mg in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid. The absorbance (2.2.25) of the solution measured at 310 nm is not greater than 0.10.

Noradrenaline. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.25 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution (a). Dissolve 12.5 mg of *noradrenaline tartrate CRS* in *water R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution (b). Dilute 2 ml of reference solution (a) to 10 ml with *water R*.

Reference solution (c). Mix 2 ml of the test solution with 2 ml of reference solution (b).

Apply separately to the plate as bands 20 mm by 2 mm 6 µl of the test solution, 6 µl of reference solution (a), 6 µl of reference solution (b) and 12 µl of reference solution (c). Allow to dry and spray the bands with a saturated solution of *sodium bicarbonate R*. Allow the plate to dry in air and spray the bands twice with *acetic anhydride R*, drying between the 2 sprayings. Heat the plate at 50 °C for 90 min. Develop over a path of 15 cm using a mixture of 0.5 volumes of *anhydrous formic acid R*, 50 volumes of *acetone R* and 50 volumes of *methylethyl chloride R*. Allow the plate to dry in air and spray with a solution freshly prepared by mixing 2 volumes of *ethylenediamine R* and 8 volumes of *methanol R* and adding 2 volumes of a 5 g/l solution of *potassium ferricyanide R*. Dry the plate at 60 °C for 10 min and examine in ultraviolet light at 254 nm and 365 nm. In the chromatogram obtained with the test solution, any zone situated between the 2 most intense zones is not more intense than the corresponding zone in the chromatogram obtained with reference solution (b) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows between the 2 most intense zones a clearly separated zone corresponding to the most intense zone in the chromatogram obtained with reference solution (a).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying *in vacuo* for 18 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of *anhydrous acetic acid R*, heating gently if necessary. Titrate with 0.1 M *perchloric acid* until a bluish-green colour is obtained using 0.1 ml of *crystal violet solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 33.33 mg of C₁₃H₁₉NO₉.

STORAGE

In an airtight container, or preferably in a sealed tube under vacuum or under an inert gas, protected from light.

01/2005:0310

AGAR

Agar

DEFINITION

Agar consists of the polysaccharides from various species of Rhodophyceae mainly belonging to the genus *Gelidium*. It is prepared by treating the algae with boiling water; the extract is filtered whilst hot, concentrated and dried.

CHARACTERS

Agar has a mucilaginous taste.

It occurs in the form of a powder or in crumpled strips 2 mm to 5 mm wide or sometimes in flakes, colourless to pale yellow, translucent, somewhat tough and difficult to break, becoming more brittle on drying.

It has the microscopic characters described under identification test A.

IDENTIFICATION

- Examine under a microscope. When mounted in 0.005 M *iodine*, the strips or flakes are partly stained brownish-violet. Magnified 100 times, they show numerous minute, colourless, ovoid or rounded grains on an amorphous background; occasional brown, round to ovoid spores with a reticulated surface, measuring up to 60 µm, may be present. Reduce to a powder, if necessary. The powder is yellowish-white. Examine under a microscope using 0.005 M *iodine*. The powder presents angular fragments with numerous grains similar to those seen in the strips and flakes; some of the fragments are stained brownish-violet.
- Dissolve 0.1 g with heating in 50 ml of *water R*. Cool. To 1 ml of the mucilage carefully add 3 ml of *water R* so as to form two separate layers. Add 0.1 ml of 0.05 M *iodine*. A dark brownish-violet colour appears at the interface. Mix. The liquid becomes pale yellow.
- Heat 5 ml of the mucilage prepared for identification test B on a water-bath with 0.5 ml of *hydrochloric acid R* for 30 min. Add 1 ml of *barium chloride solution R1*. A white turbidity develops within 30 min.
- Heat 0.5 g with 50 ml of *water R* on a water-bath until dissolved. Only a few fragments remain insoluble. During cooling, the solution gels between 35 °C and 30 °C. Heat the gel thus obtained on a water-bath; it does not liquefy below 80 °C.

TESTS

Swelling index (2.8.4). The swelling index, determined on the powdered drug (355), is not less than 10 and is within 10 per cent of the value stated on the label.

Insoluble matter. To 5.00 g of the powdered drug (355) add 100 ml of *water R* and 14 ml of *dilute hydrochloric acid R*. Boil gently for 15 min with frequent stirring. Filter the hot liquid through a tared, sintered-glass filter (160), rinse the filter with hot *water R* and dry at 100 °C to 105 °C. The residue weighs not more than 50 mg (1.0 per cent).

Gelatin. To 1.00 g add 100 ml of *water R* and heat on a water-bath until dissolved. Allow to cool to 50 °C. To 5 ml of the solution add 5 ml of *picric acid solution R*. No turbidity appears within 10 min.

Loss on drying (2.2.32). Not more than 20.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100 °C to 105 °C.

Total ash (2.4.16). Not more than 5.0 per cent.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram, determined by plate-count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

LABELLING

The label states the swelling index.

01/2005:1587

AGRIMONY

Agrimoniae herba

DEFINITION

Dried flowering tops of *Agrimonia eupatoria* L.

Content: minimum 2.0 per cent of tannins, expressed as pyrogallol (C₆H₆O₃; *M_r* 126.1) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The stem is green or, more usually, reddish, cylindrical and infrequently branched. It is covered with long, erect or tangled hairs. The leaves are compound imparipennate with 3 or 6 opposite pairs of leaflets, with 2 or 3 smaller leaflets between. The leaflets are deeply dentate to serrate, dark green on the upper surface, greyish and densely tomentose on the lower face. The flowers are small and form a terminal spike. They are pentamerous and borne in the axils of hairy bracts, the calyces closely surrounded by numerous terminal hooked spires, which occur on the rim of the hairy receptacle. The petals are free, yellow and deciduous. Fruit-bearing obconical receptacles, with deep furrows and hooked bristles, are usually present at the base of the inflorescence.
- B. Reduce to a powder (355). The powder is yellowish-green to grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous straight of bent, unicellular, long thick-walled (about 500 µm) trichomes finely warty and sometimes spirally marked; fragments of parenchyma with prisms and cluster crystals of calcium oxalate; fragments of leaf epidermis with sinuous walls, those of the lower epidermis with abundant stomata, mostly anomocytic but occasionally anisocytic; ovoid to subspherical-pollen grains, with 3 pores and a smooth exine; fragments of glandular trichomes with a multicellular uniseriate stalk and a spherical unicellular or quadricellular head; groups of fibres and spiral and banded-fitted vessels from the stem.
- C. Thin-layer chromatography (2.2.27).
Test solution. To 2.0 g of the powdered drug (355) add 20 ml of *methanol R*. Heat with shaking at 40 °C for 10 min. Filter.
Reference solution. Dissolve 1.0 mg of *rutin R* and 1.0 mg of *isoquercitroside R* in 2 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: anhydrous formic acid *R*, water *R*, ethyl acetate *R* (10:10:80 V/V/V).

Application: 10 µl, as bands.

Development: over a path of 12 cm.

Drying: at 100-105 °C.

Detection: spray the still warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine in ultraviolet light at 365 nm

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.

Top of the plate	
Isoquercitroside: an orange fluorescent zone	An orange fluorescent zone may be present (quercitroside)
	An orange fluorescent zone (isoquercitroside)
Rutin: an orange fluorescent zone	An orange fluorescent zone (hyperoside)
	An orange fluorescent zone (rutin)
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): it complies with the test for foreign matter.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 10.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (2.8.14). Use a 1.000 g of powdered drug (180).

01/2005:1238
corrected

AIR, MEDICINAL

Aer medicinalis

DEFINITION

Compressed ambient air.

Content: 20.4 per cent V/V to 21.4 per cent V/V of oxygen (O₂).

CHARACTERS

A colourless, odourless gas.

Solubility: at a temperature of 20 °C and a pressure of 101 kPa, 1 volume dissolves in about 50 volumes of water.

PRODUCTION

Carbon dioxide: maximum 500 ppm V/V, determined using an infrared analyser (2.5.24).

Gas to be examined. Use the substance to be examined. It must be filtered to avoid stray light phenomena.

Reference gas (a). Use a mixture of 79 per cent V/V of *nitrogen R1* and 21 per cent V/V of *oxygen R* containing less than 1 ppm V/V of *carbon dioxide R1*.

Reference gas (b). Use a mixture of 79 per cent V/V of *nitrogen R1* and 21 per cent V/V of *oxygen R* containing 500 ppm V/V of *carbon dioxide R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of carbon dioxide in the gas to be examined.

Carbon monoxide: maximum 5 ppm V/V, determined using an infrared analyser (2.5.25).

Gas to be examined. Use the substance to be examined. It must be filtered to avoid stray light phenomena.

Reference gas (a). Use a mixture of 79 per cent V/V of nitrogen R1 and 21 per cent V/V of oxygen R containing less than 1 ppm V/V of carbon monoxide R.

Reference gas (b). Use a mixture of 79 per cent V/V of nitrogen R1 and 21 per cent V/V of oxygen R containing 5 ppm V/V of carbon monoxide R.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of carbon monoxide in the gas to be examined.

Sulphur dioxide: maximum 1 ppm V/V, determined using an ultraviolet fluorescence analyser (Figure 1238-1).

The apparatus consists of the following:

- a system generating ultraviolet radiation with a wavelength of 210 nm, made up of an ultraviolet lamp, a collimator, and a selective filter; the beam is blocked periodically by a chopper rotating at high speeds;
- a reaction chamber, through which flows the gas to be examined;
- a system that detects radiation emitted at a wavelength of 350 nm, made up of a selective filter, a photomultiplier tube and an amplifier.

Gas to be examined. Use the substance to be examined. It must be filtered.

Reference gas (a). Use a mixture of 79 per cent V/V of nitrogen R1 and 21 per cent V/V of oxygen R.

Reference gas (b). Use a mixture of 79 per cent V/V of nitrogen R1 and 21 per cent V/V of oxygen R containing 0.5 ppm V/V to 2 ppm V/V of sulphur dioxide R1.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of sulphur dioxide in the gas to be examined.

Oil: maximum 0.1 mg/m³ calculated for atmospheric pressure and at 0 °C, determined using a measuring system such as described in Figure 1238-2.

The apparatus consists of the following:

- an on-off valve (1),
- a three-way valve (2),
- an oil cone (3),
- a bypass line (4),
- a pressure-regulator (5),
- a flow-metering device (6).

All of the apparatus is cleaned beforehand, using trichlorotrifluoroethane R free from oil and grease.

Place a micro fibre-glass filter in the oil cone (3); this filter has the following characteristics: 100 per cent borosilicate glass without binder; resistant to heat treatment at 500 °C (to eliminate organic traces); 99.999 per cent retention efficiency for NaCl particles with a diameter of 0.6 µm. Close the on-off valve (1); the substance to be examined enters the bypass line (4) and purges the three-way valve (2), the pressure-regulator (5) and the flow-metering device (6). Close the inlet valve of the compression and filtration system: open the on-off valve (1) and set the three-way valve (2) to the position allowing passage between the oil

Figure 1238-1. – UV fluorescence analyser

Figure 1238-2. – Measuring system for oil

cone and the pressure-regulator. Open the inlet valve and set the pressure-regulator (5) so that the flow indicated by the flow-metering device (6) is 20 litres/min. Pass 100.0 litres of the substance to be examined through the system.

Test solution. Remove the micro fibre-glass filter and place in an airtight container. Carefully cut up the micro fibre-glass filter and place the pieces in 25.0 ml of *trichlorotrifluoroethane R*.

Reference solutions. Prepare the reference solutions with quantities of oil (used for the lubrication of the compression system) ranging from 0.05 µg/ml to 0.5 µg/ml in *trichlorotrifluoroethane R*.

Measure the absorbance of the test solution and the reference solutions, using an appropriate infrared spectrophotometer, at 2960.3 cm⁻¹, 2927.7 cm⁻¹ and 2855.0 cm⁻¹. The sum of the 3 absorbances gives the absorbance of the oil. Use potassium bromide cells with a pathlength of several centimetres.

Plot the calibration curve from the absorbances obtained with the reference solutions and determine the quantity of oil from this curve.

Nitrogen monoxide and nitrogen dioxide: maximum 2 ppm V/V in total, determined using a chemiluminescence analyser (2.5.26).

Gas to be examined. Use the substance to be examined.

Reference gas (a). Use a mixture of 79 per cent V/V of *nitrogen R1* and 21 per cent V/V of *oxygen R* containing less than 0.05 ppm V/V of nitrogen monoxide and nitrogen dioxide.

Reference gas (b). Use a mixture of 2 ppm V/V of *nitrogen monoxide R* in *nitrogen R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of nitrogen monoxide and nitrogen dioxide in the gas to be examined.

Water: maximum 67 ppm V/V, determined using an electrolytic hygrometer (2.5.28), except where the competent authority decides that the following limit applies to medicinal air generated on-site and distributed in pipe-line systems operating at a pressure not greater than 10 bars and a temperature not less than 5 °C: maximum 870 ppm V/V, determined using an electrolytic hygrometer (2.5.28).

Assay. Determine the concentration of oxygen in air using a paramagnetic analyser (2.5.27).

IDENTIFICATION

First identification: C.

Second identification: A, B.

- A. In a conical flask containing the substance to be examined, place a glowing wood splinter. The splinter remains glowing.
- B. Use a gas burette (Figure 1238-3) of 25 ml capacity in the form of a chamber in the middle of which is a tube graduated in 0.2 per cent between 19.0 per cent and 23.0 per cent, and isolated at each end by a tap with a conical barrel. The lower tap is joined to a tube with an olive-shaped nozzle and is used to introduce the gas into the apparatus. A cylindrical funnel above the upper tap is used to introduce the absorbent solution. Wash the burette with *water R* and dry. Open the 2 taps. Connect the nozzle to the source of the substance to be examined and set the flow rate to 1 litre/min. Flush the burette by passing the substance to be examined through it for 1 min. Close the lower tap of the burette and immediately afterwards the upper tap. Rapidly disconnect the burette from the source of the substance to be examined. Rapidly give a half turn to the upper tap to eliminate any excess

pressure in the burette. Keeping the burette vertical, fill the funnel with a freshly prepared mixture of 21 ml of a 560 g/l solution of *potassium hydroxide R* and 130 ml of a 200 g/l solution of *sodium dithionite R*. Open the upper tap slowly. The solution absorbs the oxygen and enters the burette. Allow to stand for 10 min without shaking. Read the level of the liquid meniscus on the graduated part of the burette. This figure represents the percentage V/V of oxygen. The value read is 20.4 to 21.4.

Figure 1238-3. – Gas burette

C. It complies with the limits of the assay.

TESTS

Carbon dioxide: maximum 500 ppm V/V, determined using a carbon dioxide detector tube (2.1.6).

Sulphur dioxide: maximum 1 ppm V/V, determined using a sulphur dioxide detector tube (2.1.6).

Oil: maximum 0.1 mg/m³, determined using an oil detector tube (2.1.6).

Nitrogen monoxide and nitrogen dioxide: maximum 2 ppm V/V, determined using a nitrogen monoxide and nitrogen dioxide detector tube (2.1.6).

Carbon monoxide: maximum 5 ppm V/V, determined using a carbon monoxide detector tube (2.1.6).

Water vapour: maximum 67 ppm V/V, determined using a water vapour detector tube (2.1.6), except where the competent authority decides that the following limit applies to medicinal air generated on-site and distributed in pipe-line systems operating at a pressure not greater than 10 bars and a temperature not less than 5 °C: maximum 870 ppm V/V, determined using a water vapour detector tube (2.1.6).

STORAGE

As a gas, in suitable containers complying with the legal regulations or as a gas supplied by a pipe network.

IMPURITIES

- A. carbon dioxide,
- B. sulphur dioxide,
- C. nitrogen monoxide,
- D. nitrogen dioxide,
- E. oil,
- F. carbon monoxide,
- G. water.

01/2005:1684

AIR, SYNTHETIC MEDICINAL

Aer medicinalis artificiosus

DEFINITION

Mixture of *Nitrogen* (1247) and *Oxygen* (0417).

Content: 95.0 per cent to 105.0 per cent of the nominal value which is between 21.0 per cent V/V to 22.5 per cent V/V of oxygen (O₂).

CHARACTERS

Colourless and odourless gas.

Solubility: at a temperature of 20 °C and a pressure of 101 kPa, 1 volume dissolves in about 50 volumes of water.

PRODUCTION

Water (2.5.28): maximum 67 ppm V/V.

Assay (2.5.27). Carry out the determination of oxygen in gases.

IDENTIFICATION

First identification: C.

Second identification: A, B.

- A. In a conical flask containing the substance to be examined, place a glowing splinter of wood. The splinter remains glowing.

Figure 1684.-1. – Gas burette

- B. Use a gas burette (Figure 1684.-1) of 25 ml capacity in the form of a chamber, in the middle of which is a tube graduated in 0.2 per cent between 19.0 per cent and 23.0 per cent, and isolated at each end by a tap with a conical barrel. The lower tap is joined to a tube with an olive-shaped nozzle and is used to introduce the gas into the apparatus. A cylindrical funnel above the upper tap is used to introduce the absorbent solution. Wash the burette with *water R* and dry. Open both taps. Connect the nozzle to the source of the substance to be examined and set the flow rate to 1 litre/min. Flush the burette by passing the substance to be examined through it for 1 min. Close the lower tap of the burette and immediately afterwards the upper tap. Rapidly disconnect the burette from the source of the substance to be examined. Rapidly give a half turn of the upper tap to eliminate any excess pressure in the burette. Keeping the burette vertical, fill the funnel with a freshly prepared mixture of 21 ml of a 560 g/l solution of *potassium hydroxide R* and 130 ml of a 200 g/l solution of *sodium dithionite R*. Open the upper tap slowly. The solution absorbs the oxygen and enters the burette. Allow to stand for 10 min without

shaking. Read the level of the liquid meniscus on the graduated part of the burette. This figure represents the percentage *V/V* of oxygen. The value read is 95.0 per cent to 105.0 per cent of the nominal value.

C. It complies with the limits of the assay.

TESTS

Water vapour: maximum 67 ppm *V/V*, determined using a water vapour detector tube (2.1.6).

STORAGE

As a compressed gas in suitable containers complying with the legal regulations or as a compressed gas supplied by a pipe network, after mixing of the components.

LABELLING

The label states the nominal content of O₂ in per cent *V/V*.

IMPURITIES

A. water.

01/2005:0752

ALANINE

Alaninum

C₃H₇NO₂

*M*_r 89.1

DEFINITION

Alanine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*S*)-2-aminopropanoic acid, calculated with reference to the dried substance.

CHARACTERS

White or almost white, crystalline powder or colourless crystals, freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *alanine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve 0.5 g in a mixture of 1 ml of *water R*, 0.5 ml of a 100 g/l solution of *sodium nitrite R* and 0.25 ml of *hydrochloric acid R1*. Shake. Gas is given off. Add 2 ml of *dilute sodium hydroxide solution R*, followed by 0.25 ml of *iodinated potassium iodide solution R*. After about 30 min, a yellow precipitate with a characteristic odour is formed.

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Dilute 10 ml of solution S to 20 ml with *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 2.50 g in *hydrochloric acid R1* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 13.5 to + 15.5, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *alanine CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *alanine CRS* and 10 mg of *glycine CRS* in *water R* and dilute to 25 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm with a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air. Spray with *ninhydrin solution R*. Heat the plate at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH₄) R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 80.0 mg in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Using 0.1 ml of *naphtholbenzein solution R* as indicator, titrate with 0.1 *M perchloric acid*, until the colour changes from brownish-yellow to green.

1 ml of 0.1 *M perchloric acid* is equivalent to 8.91 mg of C₃H₇NO₂.

STORAGE

Store protected from light.

01/2005:1386

ALBENDAZOLE

Albendazolum

 $C_{12}H_{15}N_3O_2S$
 M_r 265.3

DEFINITION

Albendazole contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of methyl [5-(propylsulphonyl)-1*H*-benzimidazol-2-yl]carbamate, calculated with reference to the dried substance.

CHARACTERS

A white or faintly yellowish powder, practically insoluble in water, freely soluble in anhydrous formic acid, very slightly soluble in methylene chloride, practically insoluble in alcohol.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *albendazole CRS*. Examine the substances prepared as discs.

TESTS

Appearance of solution. Dissolve 0.10 g in a mixture of 1 volume of *anhydrous formic acid R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 5 ml of *methanol R* containing 1 per cent V/V of *sulphuric acid R* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of the substance to be examined in 10 ml of *methanol R* containing 1 per cent V/V of *sulphuric acid R* and dilute to 100.0 ml with the mobile phase. Dilute 0.5 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 50.0 mg of the substance to be examined and 50 mg of *oxybendazole CRS* in 5 ml of *methanol R* containing 1 per cent V/V of *sulphuric acid R* and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 10 nm and a carbon loading of 19 per cent,
- as the mobile phase at a flow rate of 0.7 ml/min a mixture of 300 volumes of a 1.67 g/l solution of *ammonium dihydrogen phosphate R* and 700 volumes of *methanol R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (b). The test is not valid unless the resolution between the peaks corresponding to albendazole and oxybendazole is at least 3.0.

Inject 20 µl of the test solution. Continue the chromatography for 1.5 times the retention time of albendazole. When the chromatograms are recorded in the prescribed conditions, the approximate relative retention times are: 0.80 for impurity A, 0.43 for impurities B and C, 0.40 for impurity D, 0.47 for impurity E and 0.57 for impurity F. In the chromatogram obtained with the test solution the area of any peak, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent) and the sum of the areas of any such peaks is not greater than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating during the titration, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.250 g in 3 ml of *anhydrous formic acid R* and add 40 ml of *anhydrous acetic acid R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 26.53 mg of $C_{12}H_{15}N_3O_2S$.

STORAGE

Store protected from light.

IMPURITIES

- A. R = S-CH₂-CH₂-CH₃: 5-(propylsulphonyl)-1*H*-benzimidazol-2-amine,
 D. R = SO₂-CH₂-CH₂-CH₃: 5-(propylsulphonyl)-1*H*-benzimidazol-2-amine,

- B. R = SO-CH₂-CH₂-CH₃: methyl [5-(propylsulphonyl)-1*H*-benzimidazol-2-yl]carbamate,
 C. R = SO₂-CH₂-CH₂-CH₃: methyl [5-(propylsulphonyl)-1*H*-benzimidazol-2-yl]carbamate,
 E. R = H: methyl (1*H*-benzimidazol-2-yl)carbamate,
 F. R = S-CH₃: methyl [5-(methylsulphonyl)-1*H*-benzimidazol-2-yl]carbamate.

01/2005:1387

ALCHEMILLA**Alchemillae herba****DEFINITION**

Alchemilla consists of the whole or cut, dried, flowering, aerial parts of *Alchemilla vulgaris* L. *sensu latiore*. It contains not less than 6.0 per cent of tannins, expressed as pyrogallol (C₆H₆O₃, *M_r* 126.1), calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The greyish-green, partly brownish-green, radical leaves which are the main part of the drug are reniform to slightly semicircular with a diameter generally up to 8 cm, seldom up to 11 cm and have 7 to 9, or 11 lobes and a long petiole. The smaller, cauline leaves, which have a pair of large stipules at the base, have 5 to 9 lobes and a shorter petiole or they are sessile. The leaves are densely pubescent especially on the lower surface and have a coarsely serrated margin. Young leaves are folded with a whitish-silvery pubescence; older leaves are slightly pubescent and have a finely meshed venation, prominent on the lower surface. The greyish-green to yellowish-green petiole is pubescent, about 1 mm in diameter, with an adaxial groove. The apetalous flowers are yellowish-green to light green and about 3 mm in diameter. The calyx is double with 4 small segments of the epicalyx alternating with 4 larger sepals, subacute to triangular. They are 4 short stamens and a single carpel with a capitate stigma. The greyish-green to yellowish-green stem is pubescent, more or less longitudinally wrinkled and hollow.

B. Reduce to a powder (355). The powder is greyish-green. Examine under a microscope, using *chloral hydrate solution R*. The powder shows unicellular, narrow trichomes up to 1 mm long partly tortuous, acuminate, and bluntly pointed at the apex, with thick lignified walls, somewhat enlarged and pitted at the base; fragments of leaves with 2 layers of palisade parenchyma, the upper layer of which is 2 to 3 times longer than the lower layer and with spongy parenchyma, containing scattered cluster crystals of calcium oxalate, up to 25 µm in diameter; leaf fragments in surface view with sinuous to wavy epidermal cells, the anticlinal walls unevenly thickened and beaded, anomocytic stomata (2.8.3); groups of vascular tissue and lignified fibres from the petioles and stems, the vessels spirally thickened or with bordered pits; occasional thin-walled conical trichomes, about 300 µm long; thin-walled parenchyma containing cluster crystals of calcium oxalate; spherical pollen grains, about 15 µm in diameter, with 3 distinct pores and a granular exine; occasional fragments of the ovary wall with cells containing a single crystal of calcium oxalate.

C. Thin-layer chromatography (2.2.27).

Test solution. To 0.5 g of the powdered drug (355) add 5 ml of *methanol R* and heat in a water-bath at 70 °C under a reflux condenser for 5 min. Cool and filter.

Reference solution. Dissolve 1.0 mg of *caffeic acid R* and 1.0 mg of *chlorogenic acid R* in 10 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (8:8:84 V/V/V).

Application: 20 µl as bands for the test solution, 10 µl as bands for the reference solution.

Development: over a path of 10 cm.

Drying: at 100-105 °C for 5 min.

Detection: spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone Chlorogenic acid: a light blue fluorescent zone	Two red fluorescent zones (chlorophyll)
	One or two intense light blue fluorescent zones
	One or several intense green to greenish yellow fluorescent zone
	An intense yellow to orange fluorescent zone
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 2 per cent.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 12.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (2.8.14). Use 0.50 g of the powdered drug (355).

01/2005:1285

ALCURONIUM CHLORIDE**Alcuronii chloridum**C₄₄H₅₀Cl₂N₄O₂*M_r* 738**DEFINITION**

Alcuronium chloride contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (1*R*,3*aS*,10*S*,11*aS*,12*R*,14*aS*,19*aS*,20*bS*,21*S*,22*aS*,23*E*,26*E*)-23,26-bis(2-hydroxyethylidene)-1,12-bis(prop-2-enyl)-2,3,11,11*a*,13,14,22,22*a*-octahydro-10*H*,21*H*-1,21:10,12-diethano-19*aH*,20*bH*-[1,5]diazocino[1,2,3-*lm*:5,6,7-

l'm [dipyrrolo[2',3'-d:2'',3''':d]dicarbazoledium dichloride (4,4'-didesmethyl-4,4'-bis(prop-2-enyl)toxi-ferin I dichloride), calculated with reference to the anhydrous, propan-2-ol-free substance.

CHARACTERS

A white or slightly greyish-white, crystalline powder, freely soluble in water and in methanol, soluble in alcohol, practically insoluble in cyclohexane.

Carry out the identification, tests and assay as rapidly as possible avoiding exposure to actinic light.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *alcuronium chloride CRS*.
- B. Examine by thin-layer chromatography (2.2.27) using a *TLC silica gel plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *alcuronium chloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of a 58.4 g/l solution of *sodium chloride R*, 35 volumes of *dilute ammonia R2* and 50 volumes of *methanol R*. Allow the plate to dry in air for 10 min and then spray with 0.1 M *ammonium and cerium nitrate*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- C. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.250 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆, BY₆ or B₆ (2.2.2, *Method I*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *hydrochloric acid*. The solution is red. Add 0.4 ml of 0.01 M *sodium hydroxide*. The solution is yellow.

Specific optical rotation (2.2.7): –430 to –451, determined on solution S and calculated with reference to the anhydrous, propan-2-ol-free substance.

Propan-2-ol. Not more than 1.0 per cent (2.4.24, *System A*).

Related substances. Examine by liquid chromatography (2.2.29).

Solvent mixture. Mix 100 ml of *methanol R*, 200 ml of *acetonitrile R* and 200 ml of a 6.82 g/l solution of *potassium dihydrogen phosphate R*. Dissolve 1.09 g of *sodium laurylsulphonate for chromatography R* in the mixture and adjust the apparent pH to 8.0 with a 100 g/l solution of *sodium hydroxide R*.

Test solution. Dissolve 0.20 g of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dilute 0.5 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 4.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Reference solution (d). To 5.0 ml of the test solution add 5.0 mg of *allylstrychnine bromide CRS*, dissolve in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.2 ml/min a solution prepared as follows: mix 200 ml of *methanol R*, 400 ml of *acetonitrile R* and 400 ml of a 6.82 g/l solution of *potassium dihydrogen phosphate R*. Dissolve 2.18 g of *sodium laurylsulphonate for chromatography R* in the mixture and adjust the apparent pH to 5.4 with a 100 g/l solution of *phosphoric acid R*,
- as detector a spectrophotometer set at 254 nm.

Inject 10 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the peak due to alcuronium is at least 10 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (d). The test is not valid unless the resolution between the peak corresponding to *N*-allylstrychnine and alcuronium is at least 4.0. Inject 10 µl of the test solution, 10 µl of reference solution (a) and 10 µl of reference solution (c). Continue the chromatography of the test solution for twice the retention time of the peak corresponding to alcuronium. In the chromatogram obtained with the test solution the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than one such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent). Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Water (2.5.12). Not more than 5.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g by stirring in 70 ml of *acetic anhydride R* for 1 min. Titrate with 0.1 M *perchloric acid* until the colour changes from violet-blue to greenish-blue, using 0.1 ml of *crystal violet solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 36.9 mg of C₄₄H₅₀Cl₂N₄O₂.

STORAGE

Store in an airtight container under nitrogen, protected from light, at a temperature of 2 °C to 8 °C.

IMPURITIES

- A. (1R,3aS,9R,9aR,10R,11aS,12R,14aS,19aS,20R,20aR,20bS,21R,22aS)-1,12-bis(prop-2-enyl)-2,3,9a,11,11a,13,14,19a,20a,21,22,22a-dodecahydro-10H,20bH-1,23:12,27-dimethano-9,10:20,21-bis(epoxyprop[2]eno)-9H,20H-[1,5]diazocino[1,2,3-lm:5,6,7-l'm']dipyrrolo[2',3'-d:2'',3''-d']dicarbazole-11,12-dichloride (4,4'-diallylcarcurin V dichloride),

- B. (4bS,7R,7aS,8aR,13R,13aR,13bS)-13-hydroxy-7-(prop-2-enyl)-5,6,7a,8,8a,11,13,13a,13b,14-decahydro-7,9-methano-7H-oxepino[3,4-a]pyrrolo[2,3-d]carbazolium chloride ((4R,17R)-4-allyl-17,18-epoxy-17-hydroxy-19,20-didehydrocuranium chloride).

01/2005:1286

ALFACALCIDOL

Alfalcaldidolum

 $C_{27}H_{44}O_2$ M_r 400.6

DEFINITION

Alfalcaldidol contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of (5Z,7E)-9,10-secocholesta-5,7,10(19)-triene-1 α ,3 β -diol.

CHARACTERS

White or almost white crystals, practically insoluble in water, freely soluble in alcohol, soluble in fatty oils. It is sensitive to air, heat and light.

A reversible isomerisation to pre-alfalcaldidol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of alfalcaldidol*.
- B. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Calculate the percentage content of related substances, apart from pre-alfalcaldidol, that are eluted within twice the retention time of alfalcaldidol from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure. The content of any individual related substance is not greater than 0.5 per cent and the sum of the related substances is not greater than 1.0 per cent. Disregard any peak below 0.1 per cent.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 1.0 mg of the substance to be examined without heating in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 1.0 mg of *alfalcaldidol CRS* without heating in 10.0 ml of the mobile phase.

Reference solution (b). Dilute reference solution (a) 100 times with the mobile phase.

Reference solution (c). Heat 2 ml of reference solution (a) in a water-bath at 80 °C under a reflux condenser for 2 h and cool.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R2* (5 μ m),
- as mobile phase at a flow rate of 2.0 ml/min a mixture of 1 volume of *ammonia R*, 200 volumes of *water R* and 800 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 265 nm,
- a loop injector.

Inject 100 μ l of reference solution (c) and record the chromatogram. Make a total of six injections. When the chromatograms are recorded in the prescribed conditions, the retention time for pre-alfalcaldidol, relative to alfalcaldidol, is about 1.3. The assay is not valid unless the relative standard deviation of the response for alfalcaldidol is at most 1 per cent and the resolution between the peaks due to pre-alfalcaldidol and alfalcaldidol is at least 4.0; adjust the proportions of the constituents of the mobile phase, if necessary, to obtain this resolution.

Inject 100 μ l of reference solution (a) and 100 μ l of reference solution (b) and record the chromatograms. Inject 100 μ l of the test solution and record the chromatogram in the same manner, continuing the chromatography for twice the retention time of the principal peak.

STORAGE

Store under nitrogen, in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

The contents of an opened container are to be used immediately.

IMPURITIES

01/2005:1487

ALFADEX

Alfadexum

A. (5*E*,7*E*)-9,10-secocholesta-5,7,10(19)-triene-1 α ,3 β -diol (*trans*-alfacalcidol),

B. (5*Z*,7*E*)-9,10-secocholesta-5,7,10(19)-triene-1 β ,3 β -diol (1 β -calcidol),

C. triazoline adduct of pre-alfacalcidol.

[C₆H₁₀O₅]₆*M*_r 973

DEFINITION

Alfadex contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of cyclohexakis-(1→4)-(α-D-glucopyranosyl) (cyclomaltohexaose or α-cyclodextrin), calculated with reference to the dried substance.

CHARACTERS

A white or almost white, amorphous or crystalline powder, freely soluble in water and in propylene glycol, practically insoluble in ethanol and in methylene chloride.

IDENTIFICATION

- It complies with the test for specific optical rotation (see Tests).
- Examine the chromatograms obtained in the assay. The retention time and size of the principal peak in the chromatogram obtained with test solution (b) are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (c).
- Dissolve 0.2 g in 2 ml of *iodine solution R4* by warming on a water-bath, and allow to stand at room temperature; a yellowish-brown precipitate is formed.

TESTS

Solution S. Dissolve 1.000 g in *carbon dioxide-free water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1).

pH (2.2.3). The pH of a mixture of 30 ml of solution S and 1 ml of a 223.6 g/l solution of *potassium chloride R* is 5.0 to 8.0.

Specific optical rotation (2.2.7): + 147 to + 152, determined on solution S and calculated with reference to the dried substance.

Reducing sugars

Test solution. To 1 ml of solution S add 1 ml of *cupri-tartaric solution R4*. Heat on a water-bath for 10 min, cool to room temperature. Add 10 ml of *ammonium molybdate reagent R1* and allow to stand for 15 min.

Reference solution. Prepare a reference solution at the same time and in the same manner as the test solution, using 1 ml of a 0.02 g/l solution of *glucose R*.

Measure the absorbance of the test solution and the reference solution (2.2.25) at the maximum at 740 nm using *water R* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (0.2 per cent).

Light-absorbing impurities. Examine solution S between 230 nm and 750 nm (2.2.25). Between 230 nm and 350 nm, the absorbance is not greater than 0.10. Between 350 nm and 750 nm, the absorbance is not greater than 0.05.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject test solution (a) and reference solution (b). In the chromatogram obtained with test solution (a): the areas of any peaks corresponding to betadex or gammacyclodextrin are not greater than half of the area of the corresponding peaks in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak and any peaks corresponding to betadex or gammacyclodextrin, is not greater than half of the area of the peak corresponding to alfadex in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 11 per cent, determined on 1.000 g by drying in an oven at 120 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 0.25 g of the substance to be examined in *water R* with heating, cool and dilute to 25.0 ml with the same solvent.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with *water R*.

Reference solution (a). Dissolve 25.0 mg of *betadex CRS*, 25.0 mg of *gammacyclodextrin CRS* and 50.0 mg of *alfadex CRS* in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with *water R*.

Reference solution (c). Dissolve 25.0 mg of *alfadex CRS* in *water R* and dilute to 25.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 10 volumes of *methanol R* and 90 volumes of *water R*,
- as detector a differential refractometer,
- a 50 µl loop injector.

Equilibrate the column with the mobile phase at a flow rate of 1.5 ml/min for about 3 h. Inject reference solution (a) 5 times and record the chromatograms for 3.5 times the retention time of alfadex. Adjust the sensitivity of the system so that the height of the peak corresponding to gammacyclodextrin is 55 per cent to 75 per cent of the full scale of the recorder. The retention time of alfadex is about 10 min, the relative retention of gammacyclodextrin is about 0.7 and that of betadex is about 2.2. The test is not valid unless the resolution between the peaks corresponding to

gammacyclodextrin and alfadex is at least 1.5 and the relative standard deviation for the area of the peak corresponding to alfadex is less than 2.0 per cent. If necessary, adjust the concentration of methanol in the mobile phase to achieve the required resolution. Inject alternately test solution (b) and reference solution (c). Calculate the percentage content of $[C_6H_{10}O_5]_6$ from the area of the principal peak in each of the chromatograms obtained and from the declared content of *alfadex CRS*.

STORAGE

Store in an airtight container.

IMPURITIES

A. betadex,

B. cyclooctakis-(1→4)-(α-D-glucopyranosyl) (cyclomaltooctaose or γ-cyclodextrin).

01/2005:1062

ALFENTANIL HYDROCHLORIDE

Alfentanili hydrochloridum

$C_{21}H_{33}ClN_6O_3$

M_r 453.0

DEFINITION

Alfentanil hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of *N*-[1-[2-(4-ethyl-4,5-dihydro-5-oxo-1*H*-tetrazol-1-yl)ethyl]-4-(methoxymethyl)piperidin-4-yl]-*N*-phenylpropanamide hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, freely soluble in water, in alcohol and in methanol.

It melts at about 140 °C, with decomposition.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of alfentanil hydrochloride*.
- B. Dissolve 50 mg in a mixture of 0.4 ml of *ammonia R* and 2 ml of *water R*. Mix, allow to stand for 5 min and filter. Acidify the filtrate with *dilute nitric acid R*. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.2 g in *water R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). In order to prepare the *in situ* degradation compound (alfentanil impurity E), dissolve 10 mg of the substance to be examined in 10.0 ml of *dilute hydrochloric acid R*. Heat on a water-bath under a reflux condenser for 4 h. Neutralise with 10.0 ml of *dilute sodium hydroxide solution R*. Evaporate to dryness on a water-bath. Cool and take up the residue in 10 ml of *methanol R*. Filter.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 20.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min, a gradient programme using the following conditions:
Mobile phase A. A 5 g/l solution of *ammonium carbonate R* in a mixture of 10 volumes of *tetrahydrofuran R* and 90 volumes of *water R*,
Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	90 → 40	10 → 60	linear gradient
15 - 20	40	60	isocratic elution
20 - 25	90	10	switch to initial composition
25 = 0	90	10	restart gradient

- as detector a spectrophotometer set at 220 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate at the initial eluent composition for at least 5 min. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions the retention times are: alfentanil impurity E about 6 min and alfentanil hydrochloride about 7 min. Disregard any other peak. The test is not valid unless the resolution between the peaks corresponding to alfentanil hydrochloride and alfentanil impurity E is at least 4.0. If necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear-gradient elution.

Inject 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak,

apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak obtained with the blank-run, and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.5.12): 3.0 per cent to 4.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Dissolve 0.350 g in 50 ml of a mixture of 1 volume of *alcohol R* and 4 volumes of *water R* and add 5.0 ml of 0.01 *M hydrochloric acid*. Titrate with 0.1 *M sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Read the volume added between the two points of inflexion.

1 ml of 0.1 *M sodium hydroxide* is equivalent to 45.30 mg of C₂₁H₃₃ClN₆O₃.

STORAGE

Store protected from light.

IMPURITIES

A. *cis*-N-[1-[2-(4-ethyl-4,5-dihydro-5-oxo-1H-tetrazol-1-yl)ethyl]-4-(methoxymethyl)piperidin-4-yl]-N-phenylpropanamide *N*-oxide,

B. *trans*-N-[1-[2-(4-ethyl-4,5-dihydro-5-oxo-1H-tetrazol-1-yl)ethyl]-4-(methoxymethyl)piperidin-4-yl]-N-phenylpropanamide *N*-oxide,

C. *N*-[4-(methoxymethyl)piperidin-4-yl]-*N*-phenylpropanamide,

D. *N*-[1-[2-(4-ethyl-4,5-dihydro-5-oxo-1H-tetrazol-1-yl)ethyl]-4-(methoxymethyl)piperidin-4-yl]-*N*-phenylacetamide,

- E. 1-ethyl-1,4-dihydro-4-[2-[[4-(methoxymethyl)-4-phenylamino]piperidin-1-yl]ethyl]-5H-tetrazol-5-one,

- F. N-[1-(2-hydroxyethyl)-4-(methoxymethyl)piperidin-4-yl]-N-phenylpropanamide,

- G. N-[1-[2-(4-ethyl-4,5-dihydro-5-oxo-1H-tetrazol-1-yl)ethyl]-4-(propanoyloxymethyl)piperidin-4-yl]-N-phenylpropanamide,

- H. N-[1-[2-(4-ethyl-4,5-dihydro-5-oxo-1H-tetrazol-1-yl)ethyl]-4-(methoxymethyl)piperidin-4-yl]-N-phenylbutanamide.

01/2005:1287

ALFUZOSIN HYDROCHLORIDE

Alfuzosini hydrochloridum

C₁₉H₂₈ClN₅O₄M_r 425.9

DEFINITION

Alfuzosin hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-N-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]tetrahydrofuran-2-carboxamide hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly hygroscopic, freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *alfuzosin hydrochloride CRS*. Examine the substances prepared as discs.

- B. To 1 ml of solution S (see Tests) add 1 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.500 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

pH (2.2.3). The pH of freshly prepared solution S is 4.0 to 6.0.

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *alfuzosin impurity A CRS* in the mobile phase and dilute to 25 ml with the mobile phase. To 1 ml of the solution, add 1 ml of the test solution and dilute to 100 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with microparticulate *octadecylsilyl silica gel for chromatography R* (5 µm), with a carbon loading of 18.5 per cent, a specific surface area of 320 m²/g, a pore size of 15 nm, and end-capped with hexamethyldisilane,
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 1 volume of *tetrahydrofuran R*, 20 volumes of *acetonitrile R* and 80 volumes of a solution of sodium perchlorate prepared as follows: dilute 5.0 ml of *perchloric acid R* in 900 ml of *water R*, adjust to pH 3.5 with *dilute sodium hydroxide solution R* and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the two peaks in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to alfuzosin and alfuzosin impurity A is at least 3.0. Inject 20 µl of the test solution and 20 µl of reference solution (a). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.025 times that of the principal peak in the chromatogram obtained with reference solution (a).

Water (2.5.12). Not more than 2.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 40 ml of *anhydrous acetic acid R* and 40 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 42.59 mg of C₁₉H₂₈ClN₅O₄.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. *N*-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]furan-2-carboxamide,
 B. R-Cl: 2-chloro-6,7-dimethoxyquinazolin-4-amine,

- C. (*RS*)-*N*-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)amino]propyl]-*N*-methyltetrahydrofuran-2-carboxamide,

- D. *N*-(4-amino-6,7-dimethoxyquinazolin-2-yl)-*N*-methylpropane-1,3-diamine,

- E. *N*-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]formamide.

01/2005:0591

ALGINIC ACID

Acidum alginicum

DEFINITION

Alginic acid is a mixture of polyuronic acids [(C₆H₈O₆)_{*n*}] composed of residues of D-mannuronic and L-guluronic acid and is obtained mainly from algae belonging to the Phaeophyceae. A small proportion of the carboxyl groups may be neutralised. It contains not less than 19.0 per cent and not more than 25.0 per cent of carboxyl groups (COOH), calculated with reference to the dried substance.

CHARACTERS

A white or pale yellowish-brown, crystalline or amorphous powder, very slightly soluble or practically insoluble in alcohol, practically insoluble in organic solvents. It swells in water but does not dissolve; it dissolves in solutions of alkali hydroxides.

IDENTIFICATION

- A. To 0.2 g add 20 ml of *water R* and 0.5 ml of *sodium carbonate solution R*. Shake and filter. To 5 ml of the filtrate add 1 ml of *calcium chloride solution R*. A voluminous gelatinous mass is formed.

- B. To 5 ml of the filtrate obtained in identification test A add 0.5 ml of a 123 g/l solution of *magnesium sulphate R*. No voluminous gelatinous mass is formed.
 C. To 5 mg add 5 ml of *water R*, 1 ml of a freshly prepared 10 g/l solution of *1,3-dihydroxynaphthalene R* in *alcohol R* and 5 ml of *hydrochloric acid R*. Boil gently for 3 min, cool, add 5 ml of *water R*, and shake with 15 ml of *di-isopropyl ether R*. Carry out a blank test. The upper layer obtained with the substance to be examined exhibits a deeper bluish-red colour than that obtained with the blank.

TESTS

Chlorides. Not more than 1.0 per cent. To 2.50 g add 50 ml of *dilute nitric acid R*, shake for 1 h and dilute to 100.0 ml with *dilute nitric acid R*. Filter. To 50.0 ml of the filtrate add 10.0 ml of 0.1 *M silver nitrate* and 5 ml of *toluene R*. Titrate with 0.1 *M ammonium thiocyanate*, using 2 ml of *ferric ammonium sulphate solution R2* as indicator and shaking vigorously towards the end point.

1 ml of 0.1 *M silver nitrate* is equivalent to 3.545 mg of Cl.

Heavy metals (2.4.8). 1.0 g complies with the limit test F for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 15.0 per cent, determined on 0.1000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 8.0 per cent, determined on 0.100 g and calculated with reference to the dried substance.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10² micro-organisms per gram, determined by plate-count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

To 0.2500 g add 25 ml of *water R*, 25.0 ml of 0.1 *M sodium hydroxide* and 0.2 ml of *phenolphthalein solution R*. Titrate with 0.1 *M hydrochloric acid*.

1 ml of 0.1 *M sodium hydroxide* is equivalent to 4.502 mg of carboxyl groups (COOH).

01/2005:1288

ALLANTOIN

Allantoinum

C₄H₆N₄O₃M_r 158.1

DEFINITION

Allantoin contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-(2,5-dioxoimidazolidin-4-yl)urea.

CHARACTERS

A white, crystalline powder, slightly soluble in water, very slightly soluble in alcohol.

It melts at about 225 °C, with decomposition.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *allantoin CRS*.
- B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. Boil 20 mg with a mixture of 1 ml of *dilute sodium hydroxide solution R* and 1 ml of *water R*. Allow to cool. Add 1 ml of *dilute hydrochloric acid R*. To 0.1 ml of the solution add 0.1 ml of a 100 g/l solution of *potassium bromide R*, 0.1 ml of a 20 g/l solution of *resorcinol R* and 3 ml of *sulphuric acid R*. Heat for 5 min to 10 min on a water-bath. A dark blue colour develops, which becomes red after cooling and pouring into about 10 ml of *water R*.
- D. Heat about 0.5 g. Ammonia vapour is evolved, which turns *red litmus paper R* blue.

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R*, with heating if necessary, and dilute to 100 ml with the same solvent.

Acidity or alkalinity. To 5 ml of solution S add 5 ml of *carbon dioxide-free water R*, 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is red.

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^\circ$.

Reducing substances. Shake 1.0 g with 10 ml of *water R* for 2 min. Filter. Add 1.5 ml of 0.02 M *potassium permanganate*. The solution must remain violet for at least 10 min.

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable *cellulose for chromatography R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 5.0 ml of *water R* with heating. Allow to cool. Dilute to 10 ml with *methanol R*. Use the solution immediately after preparation.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *methanol R* and 1 volume of *water R*.

Reference solution (a). Dissolve 10 mg of *allantoin CRS* in a mixture of 1 volume of *methanol R* and 1 volume of *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *urea R* in 10 ml of *water R*. Dilute 1 ml of this solution to 10 ml with *methanol R*.

Reference solution (c). Mix 1 ml of reference solution (a) and 1 ml of reference solution (b).

Apply to the plate 10 µl of test solution (a) and 5 µl each of test solution (b), reference solution (a), reference solution (b) and reference solution (c). Develop over a path of 10 cm using a mixture of 15 volumes of *glacial acetic acid R*, 25 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air. Spray the plate with a 5 g/l solution of *dimethylaminobenzaldehyde R* in a mixture of 1 volume of *hydrochloric acid R* and 3 volumes of *methanol R*. Dry the plate in a current of hot air. Examine in daylight after 30 min. Any spot in the chromatogram obtained with test

solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Loss on drying (2.2.32). Not more than 0.1 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 120.0 mg in 40 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 15.81 mg of $C_5H_4N_4O$.

IMPURITIES

A. glyoxylic acid,

B. urea.

01/2005:0576

ALLOPURINOL

Allopurinolum

 $C_5H_4N_4O$
 M_r 136.1

DEFINITION

1,5-Dihydro-4H-pyrazolo[3,4-d]pyrimidin-4-one.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: very slightly soluble in water and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Dissolve 10 mg in 1 ml of a 4 g/l solution of *sodium hydroxide R* and dilute to 100.0 ml with a 10.3 g/l solution of *hydrochloric acid R*. Dilute 10.0 ml of this solution to 100.0 ml with a 10.3 g/l solution of *hydrochloric acid R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 250 nm and an absorption minimum at 231 nm. The ratio of the absorbance measured at the absorption minimum at 231 nm to that measured at the absorption maximum at 250 nm is 0.52 to 0.62.
- B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *allopurinol CRS*.

C. Dissolve 0.3 g in 2.5 ml of *dilute sodium hydroxide solution R* and add 50 ml of *water R*. Add slowly and with shaking 5 ml of *silver nitrate solution R1*. A white precipitate is formed which does not dissolve on the addition of 5 ml of *ammonia R*.

D. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 20 mg of the substance to be examined in *concentrated ammonia R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *allopurinol CRS* in *concentrated ammonia R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *ethanol R*, *methylene chloride R* (40:60 V/V).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use. Store them and inject them at 8 °C using a cooled autosampler.

Test solution (a). Dissolve 25.0 mg of the substance to be examined in 2.5 ml of a 4 g/l solution of *sodium hydroxide R* and dilute immediately to 50.0 ml with the mobile phase.

Test solution (b). Dissolve 20.0 mg of the substance to be examined in 5.0 ml of a 4 g/l solution of *sodium hydroxide R* and dilute immediately to 250.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *allopurinol impurity A CRS*, 5.0 mg of *allopurinol impurity B CRS* and 5.0 mg of *allopurinol impurity C CRS* in 5.0 ml of a 4 g/l solution of *sodium hydroxide R* and dilute immediately to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 20.0 mg of *allopurinol CRS* in 5.0 ml of a 4 g/l solution of *sodium hydroxide R* and dilute immediately to 250.0 ml with the mobile phase.

Column:

- *size:* $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase:* octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: 1.25 g/l solution of *potassium dihydrogen phosphate R*.

Flow rate: 1.4 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl of test solution (a) and reference solutions (a) and (b).

Run time: twice the retention time of allopurinol.

Elution order: impurity A, impurity B, impurity C, allopurinol.

Retention time: allopurinol = about 10 min.

System suitability: reference solution (b):

- *resolution:* minimum 1.1 between the peaks due to impurity B and impurity C.

Limits:

- *impurity A:* not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *impurity B:* not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *impurity C:* not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *any other impurity:* for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *sum of impurities other than A, B and C:* not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *disregard limit:* 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Impurities D and E. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use. Store them and inject them at 8 °C using a cooled autosampler.

Solution A: 1.25 g/l solution of *potassium dihydrogen phosphate R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in 5.0 ml of a 4 g/l solution of *sodium hydroxide R* and dilute immediately to 100.0 ml with solution A.

Reference solution. Dissolve 5.0 mg of *allopurinol impurity D CRS* and 5.0 mg of *allopurinol impurity E CRS* in 5.0 ml of a 4 g/l solution of *sodium hydroxide R* and dilute immediately to 100.0 ml with solution A. Dilute 1.0 ml of this solution to 100.0 ml with solution A.

Column:

- *size:* $l = 0.05$ m, $\varnothing = 4.6$ mm,
- *stationary phase:* base-deactivated octadecylsilyl silica gel for chromatography *R* (3 µm).

Mobile phase: *methanol R*, 1.25 g/l solution of *potassium dihydrogen phosphate R* (10:90 V/V).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

Run time: 1.5 times the retention time of impurity E.

Retention times: impurity D = about 3.6 min; impurity E = about 4.5 min.

System suitability: reference solution:

- *resolution:* minimum 2.0 between the peaks due to impurity D and impurity E.

Limits:

- *impurity D:* not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent),
- *impurity E:* not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (c).

Calculate the percentage content of $C_5H_4N_4O$ from the areas of the peaks and the declared content of *allopurinol CRS*.

IMPURITIES

Specified impurities: A, B, C, D, E.

- A. R1 = NH₂, R2 = H: 5-amino-1*H*-pyrazole-4-carboxamide,
 B. R1 = NH₂, R2 = CHO: 5-(formylamino)-1*H*-pyrazole-4-carboxamide,
 D. R1 = O-CH₂-CH₃, R2 = H: ethyl 5-amino-1*H*-pyrazole-4-carboxylate,
 E. R1 = O-CH₂-CH₃, R2 = CHO: ethyl 5-(formylamino)-1*H*-pyrazole-4-carboxylate,

- C. 5-(4*H*-1,2,4-triazol-4-yl)-1*H*-pyrazole-4-carboxamide.

corrected

ALMAGATE

Almagatum

Al₂Mg₆C₂O₂₀H₁₄·4H₂O

M_r 630

DEFINITION

Hydrated aluminium magnesium hydroxycarbonate.

Content:

- aluminium: 15.0 per cent to 17.0 per cent (calculated as Al₂O₃),
- magnesium: 36.0 per cent to 40.0 per cent (calculated as MgO),
- carbonic acid: 12.5 per cent to 14.5 per cent (calculated as CO₂).

CHARACTERS

Appearance: white or almost white, fine crystalline powder.

Solubility: practically insoluble in water, in alcohol and in methylene chloride. It dissolves with effervescence and heating in dilute mineral acids.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of almagate*.

- B. Dissolve 150 mg in *dilute hydrochloric acid R* and dilute to 20 ml with the same acid. 2 ml of the solution gives the reaction of aluminium (2.3.1).

- C. 2 ml of the solution prepared under identification test B gives the reaction of magnesium (2.3.1).

TESTS

pH (2.2.3): 9.1 to 9.7.

Disperse 4.0 g in 100 ml of *carbon dioxide-free water R*, stir for 2 min and filter.

Neutralising capacity. Carry out the test at 37 °C. Disperse 0.5 g in 100 ml of *water R*, heat, add 100.0 ml of 0.1 *M* *hydrochloric acid*, previously heated and stir continuously; the pH (2.2.3) of the solution between 5 min and 20 min is not less than 3.0 and not greater than 4.5. Add 10.0 ml of 0.5 *M* *hydrochloric acid*, previously heated, stir continuously for 1 h and titrate with 0.1 *M* *sodium hydroxide* to pH 3.5; not more than 20.0 ml of 0.1 *M* *sodium hydroxide* is required.

Chlorides (2.4.4): maximum 0.1 per cent.

Dissolve 0.33 g in 5 ml of *dilute nitric acid R* and dilute to 100 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides. Prepare simultaneously the standard by diluting 0.7 ml of *dilute nitric acid R* to 5 ml with *water R* and adding 10 ml of *chloride standard solution* (5 ppm Cl) *R*.

Sulphates (2.4.13): maximum 0.4 per cent.

Dissolve 0.25 g in 5 ml of *dilute hydrochloric acid R* and dilute to 100 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates. Prepare simultaneously the standard by adding 0.8 ml of *dilute hydrochloric acid R* to 15 ml of *sulphate standard solution* (10 ppm SO₄) *R*.

Sodium: maximum 150 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 0.25 g in 50 ml of a 103 g/l solution of *hydrochloric acid R*.

Reference solutions. Prepare the reference solutions using *sodium standard solution* (200 ppm Na) *R*, diluted as necessary with a 103 g/l solution of *hydrochloric acid R*.

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 1.0 g in *dilute hydrochloric acid R* and dilute to 20.0 ml with the same acid. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on ignition: 43.0 per cent to 49.0 per cent, determined on 1.000 g by ignition at 900 °C.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram determined by plate count. It complies with the tests for *Escherichia coli* and *Pseudomonas aeruginosa* (2.6.13).

ASSAY

Aluminium. Dissolve 1.000 g in 5 ml of *hydrochloric acid R*, heating if necessary. Allow to cool to room temperature and dilute to 100.0 ml with *water R* (solution A). Introduce 10.0 ml of solution A into a 250 ml conical flask, add 25.0 ml of 0.05 *M* *sodium edetate*, 20 ml of *buffer solution pH 3.5 R*, 40 ml of *ethanol R* and 2 ml of a freshly prepared 0.25 g/l solution of *dithizone R* in *ethanol R*. Titrate the excess of sodium edetate with 0.05 *M* *zinc sulphate* until the colour changes from greenish-violet to pink.

1 ml of 0.05 *M* *sodium edetate* is equivalent to 2.549 mg of Al₂O₃.

Magnesium. Introduce 10.0 ml of solution A prepared in the assay of aluminium into a 500 ml conical flask, add 200 ml of *water R*, 20 ml of *triethanolamine R* with shaking, 10 ml of

IMPURITIES

- A. 4-O-(3-amino-3-deoxy- α -D-glucopyranosyl)-2-deoxy-6-O-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-L-streptamine (kanamycin B),

- B. R = H: 2-deoxy-4-O-(2,6-diamino-2,3,6-trideoxy- α -D-ribohexopyranosyl)-D-streptamine (nebramine),
C. R = OH: 2-deoxy-4-O-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-D-streptamine (neamine).

01/2005:0692

all-*rac*- α -TOCOPHEROLint-*rac*- α -Tocopherolum $C_{29}H_{50}O_2$ M_r 430.7

DEFINITION

all-*rac*-2,5,7,8-Tetramethyl-2-(4,8,12-trimethyltridecyl)-3,4-dihydro-2*H*-1-benzopyran-6-ol.

Content: 96.0 per cent to 101.5 per cent.

CHARACTERS

Appearance: clear, colourless or yellowish-brown, viscous, oily liquid.

Solubility: practically insoluble in water, freely soluble in acetone, in ethanol, in methylene chloride and in fatty oils.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

- A. Optical rotation (2.2.7): -0.01° to $+0.01^\circ$.

Dissolve 2.50 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

- B. Infrared absorption spectrophotometry (2.2.24).

Comparison: α -tocopherol CRS.

- C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in 2 ml of *cyclohexane R*.

Reference solution. Dissolve 10 mg of α -tocopherol CRS in 2 ml of *cyclohexane R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *ether R*, *cyclohexane R* (20:80 V/V).

Application: 10 μ l.

Development: over 2/3 of the plate.

Drying: in a current of air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Gas chromatography (2.2.28): use the normalisation procedure.

Internal standard solution. Dissolve 1.0 g of *squalane R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Test solution (a). Dissolve 0.100 g of the substance to be examined in 10.0 ml of the internal standard solution.

Test solution (b). Dissolve 0.100 g of the substance to be examined in 10 ml of *cyclohexane R*.

Reference solution (a). Dissolve 0.100 g of α -tocopherol CRS in 10.0 ml of the internal standard solution.

Reference solution (b). Dissolve 10 mg of the substance to be examined and 10 mg of α -tocopheryl acetate *R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of all-*rac*- α -tocopherol for peak identification CRS in *cyclohexane R* and dilute to 1 ml with the same solvent.

Reference solution (d). Dilute 1.0 ml of test solution (b) to 100.0 ml with *cyclohexane R*. Dilute 1.0 ml of this solution to 10.0 ml with *cyclohexane R*.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.25$ mm,
- **stationary phase:** poly(dimethyl)siloxane *R* (film thickness 0.25 μ m).

Carrier gas: helium for chromatography *R*.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

- **column:** 280 $^\circ$ C,
- **injection port and detector:** 290 $^\circ$ C.

Detection: flame ionisation.

Injection: 1 μ l of test solution (b) and reference solutions (b), (c) and (d).

Run time: twice the retention time of all-*rac*- α -tocopherol.

Relative retention with reference to all-*rac*- α -tocopherol (retention time = about 13 min): *squalane* = about 0.5; impurity A = about 0.7; impurity B = about 0.8. Use the chromatogram supplied with the CRS and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A and B.

System suitability: reference solution (b):

- **resolution:** minimum 3.5 between the peaks due to all-*rac*- α -tocopherol and α -tocopheryl acetate.

Limits:

- **impurity A:** maximum 0.5 per cent,

- *impurity B*: maximum 1.5 per cent,
- *any other impurity*: for each impurity, maximum 0.25 per cent,
- *total*: maximum 2.5 per cent,
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

ASSAY

Gas chromatography (2.2.28) as described in the test for related substances with the following modification.

Injection: test solution (a) and reference solution (a).

Calculate the percentage content of $C_{29}H_{50}O_2$ taking into account the declared content of α -tocopherol CRS.

STORAGE

Under an inert gas, protected from light.

IMPURITIES

Specified impurities: A, B.

- A. all-*rac-trans*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-ol,

- B. all-*rac-cis*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-ol.

01/2005:1256

RRR- α -TOCOPHEROL**RRR- α -Tocopherolum** $C_{29}H_{50}O_2$ M_r 430.7**DEFINITION**

RRR- α -Tocopherol contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of (2*R*)-2,5,7,8-tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-ol.

CHARACTERS

A clear, colourless or yellowish-brown, viscous, oily liquid, practically insoluble in water, freely soluble in acetone, in ethanol, in methylene chloride and in fatty oils.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. It complies with the test for absorbance (see Tests).

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with α -tocopherol CRS.

C. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel F_{254} plate R.

Test solution. Dissolve 10 mg of the substance to be examined in 2 ml of cyclohexane R.

Reference solution. Dissolve 10 mg of α -tocopherol CRS in 2 ml of cyclohexane R.

Apply separately to the plate 10 μ l of each solution.

Develop over a path of 15 cm using a mixture of 20 volumes of ether R and 80 volumes of cyclohexane R. Dry the plate in a current of air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution. Spray the plate with a mixture of 10 volumes of hydrochloric acid R, 40 volumes of a 2.5 g/l solution of ferric chloride R in alcohol R and 40 volumes of a 10 g/l solution of phenanthroline hydrochloride R in alcohol R. After 1 h to 2 h, the principal spots are orange.

D. RRR- α -tocopherol is dextrorotatory (2.2.7). The specific optical rotation after oxidation to the quinone form is not less than + 24.

Dissolve 1.0 g of the substance to be examined in 50 ml of ether R. To the solution add 20 ml of a 100 g/l solution of potassium ferricyanide R in an 8 g/l solution of sodium hydroxide R and shake for 3 min. Wash the ether solution with four quantities, each of 50 ml, of water R, discard the washings and dry the ether layer over anhydrous sodium sulphate R. Evaporate the ether on a water-bath under reduced pressure or in an atmosphere of nitrogen until a few millilitres remain, then complete the evaporation removing the last traces of ether without the application of heat. Immediately dissolve the residue in 5.0 ml of trimethylpentane R and determine the optical rotation.

Calculate the specific optical rotation of the substance in the test solution using as *c* the number of grams of RRR- α -tocopherol in 1000 ml.

TESTS

Absorbance (2.2.25). Dissolve 0.100 g in ethanol R and dilute to 100 ml with the same solvent (solution A). Dilute 10.0 ml of solution A to 100.0 ml with ethanol R (solution B). Measure the absorbance of solution B at the maximum at 292 nm and of solution A at the minimum at 255 nm. The specific absorbance at the maximum is 72.0 to 76.0 and that at the minimum is 5.5 to 8.0.

Acid value (2.5.1). Not more than 2.0, determined on 2.00 g.

Heavy metals (2.4.8). 0.50 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 1 ml of lead standard solution (10 ppm Pb) R.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g. Use sulphuric acid R instead of dilute sulphuric acid R.

ASSAY

Examine by gas chromatography (2.2.28), using dotriacontane R as the internal standard.

STORAGE

Store in an airtight, well-filled container, protected from light.

LABELLING

The label states the content of α -tocopherol acetate, expressed in grams per 100 g of concentrate.

01/2005:0439

all-*rac*- α -TOCOPHERYL ACETATEint-*rac*- α -Tocopherylis acetas $C_{31}H_{52}O_3$ M_r 472.7

DEFINITION

all-*rac*-2,5,7,8-Tetramethyl-2-(4,8,12-trimethyltridecyl)-3,4-dihydro-2*H*-1-benzopyran-6-yl acetate.

Content: 96.5 per cent to 101.0 per cent.

CHARACTERS

Appearance: clear, colourless or slightly greenish-yellow, viscous, oily liquid.

Solubility: practically insoluble in water, freely soluble in acetone, in ethanol and in fatty oils.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Optical rotation (2.2.7): -0.01° to $+0.01^\circ$.

Dissolve 2.50 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: α -tocopheryl acetate CRS.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve about 10 mg of the substance to be examined in 2 ml of *cyclohexane R*.

Reference solution. Dissolve about 10 mg of α -tocopheryl acetate CRS in 2 ml of *cyclohexane R*.

Plate: TLC silica gel F_{254} plate R.

Mobile phase: *ether R*, *cyclohexane R* (20:80 V/V).

Application: 10 μ l.

Development: over 2/3 of the plate.

Drying: in a current of air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Gas chromatography (2.2.28): use the normalisation procedure.

Internal standard solution. Dissolve 1.0 g of *squalane R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Test solution (a). Dissolve 0.100 g of the substance to be examined in 10.0 ml of the internal standard solution.

Test solution (b). Dissolve 0.100 g of the substance to be examined in 10 ml of *cyclohexane R*.

Reference solution (a). Dissolve 0.100 g of α -tocopheryl acetate CRS in 10.0 ml of the internal standard solution.

Reference solution (b). Dissolve 10 mg of the substance to be examined and 10 mg of α -tocopherol R in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of all-*rac*- α -tocopheryl acetate for peak identification CRS in *cyclohexane R* and dilute to 1 ml with the same solvent.

Reference solution (d). Dilute 1.0 ml of test solution (b) to 100.0 ml with *cyclohexane R*. Dilute 1.0 ml of this solution to 10.0 ml with *cyclohexane R*.

Column:

- *material*: fused silica,
- *size*: $l = 30$ m, $\varnothing = 0.25$ mm,
- *stationary phase*: poly(dimethyl)siloxane R (film thickness 0.25 μ m).

Carrier gas: helium for chromatography R.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

- *column*: 280 $^\circ$ C,
- *injection port and detector*: 290 $^\circ$ C.

Detection: flame ionisation.

Injection: 1 μ l of test solution (b) and reference solutions (a), (b), (c) and (d).

Run time: twice the retention time of all-*rac*- α -tocopheryl acetate.

Relative retention with reference to all-*rac*- α -tocopheryl acetate (retention time = about 15 min): squalane = about 0.4; impurity A = about 0.7; impurity B = about 0.8; impurity C = about 0.9; use the chromatogram supplied with the CRS to identify the peaks due to impurities A and B in the chromatogram obtained with reference solution (c).

System suitability:

- *resolution*: minimum 3.5 between the peaks due to impurity C and all-*rac*- α -tocopheryl acetate in the chromatogram obtained with reference solution (b),
- in the chromatogram obtained with reference solution (a), the area of the peak due to impurity C is not greater than 0.2 per cent of the area of the peak due to all-*rac*- α -tocopheryl acetate.

Limits:

- *impurities A, C*: for each impurity, maximum 0.5 per cent,
- *impurity B*: maximum 1.5 per cent,
- *any other impurity*: for each impurity, maximum 0.25 per cent,
- *total*: maximum 2.5 per cent,
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

ASSAY

Gas chromatography (2.2.28) as described in the test for related substances with the following modification.

Injection: test solution (a) and reference solution (a).

Calculate the percentage content of $C_{31}H_{52}O_3$ taking into account the declared content of α -tocopheryl acetate CRS.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

- A. all-*rac-trans*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-yl acetate,

- B. all-*rac-cis*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-yl acetate,
C. all-*rac*- α -tocopherol.

01/2005:1257

RRR- α -TOCOPHERYL ACETATERRR- α -Tocopherylis acetasC₃₁H₅₂O₃M_r 472.7

DEFINITION

RRR- α -Tocopheryl acetate contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of (2*R*)-2,5,7,8-tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl acetate.

CHARACTERS

A clear, pale greenish-yellow, viscous, oily liquid, practically insoluble in water, freely soluble in acetone, in ethanol and in fatty oils, soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. It complies with the test for absorbance (see Tests).
B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with α -tocopheryl acetate CRS.
C. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel F₂₅₄ plate *R*.

Test solution (a). Dissolve 10 mg of the substance to be examined in 2 ml of cyclohexane *R*.

Test solution (b). In a ground glass-stoppered tube, dissolve 10 mg of the substance to be examined in 2 ml of 2.5 *M* alcoholic sulphuric acid *R*. Heat on a water-bath for 5 min. Cool and add 2 ml of water *R* and 2 ml of cyclohexane *R*. Shake for 1 min. Use the upper layer.

Reference solution (a). Dissolve 10 mg of α -tocopheryl acetate CRS in 2 ml of cyclohexane *R*.

Reference solution (b). Prepare as described for test solution (b), using α -tocopheryl acetate CRS instead of the substance to be examined.

Apply separately to the plate 10 μ l of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of ether *R* and 80 volumes of cyclohexane *R*. Dry the plate in a current of air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). In the chromatograms obtained with test solution (b) and reference solution (b), there are two spots: the spot with the higher *R_f* value is due to α -tocopheryl acetate and corresponds to the spot in the chromatogram obtained with reference solution (a); the spot with the lower *R_f* value is due to α -tocopherol. Spray the plate with a mixture of 10 volumes of hydrochloric acid *R*, 40 volumes of a 2.5 g/l solution of ferric chloride *R* in alcohol *R* and 40 volumes of a 10 g/l solution of phenanthroline hydrochloride *R* in alcohol *R*. In the chromatograms obtained with test solution (b) and reference solution (b), the spot due to α -tocopherol is orange.

- D. After saponification, the resulting RRR- α -tocopherol is dextrorotatory (2.2.7). The specific optical rotation after oxidation to the quinone form is at least + 24.

Carry out the test avoiding exposure to actinic light. Transfer 1.0 g of the substance to be examined to a 250 ml round-bottomed flask with a ground-glass stopper; dissolve in 30 ml of ethanol *R* and heat under reflux for 3 min. While the solution is boiling, add, through the condenser, 20 ml of 2 *M* alcoholic potassium hydroxide solution *R*. Continue heating under reflux for 20 min and, without cooling, add 4.0 ml of hydrochloric acid *R* dropwise through the condenser. Cool, rinse the condenser with 10 ml of ethanol *R*, transfer the contents of the flask to a 500 ml separating funnel. Rinse the flask with four quantities, each of 25 ml, of water *R* and four quantities, each of 25 ml, of ether *R*. Add the rinsings to the separating funnel. Shake vigorously for 2 min, allow the layers to separate and collect each of the two layers in individual separating funnels. Shake the aqueous layer with two quantities, each of 50 ml, of ether *R* and add these extracts to the main ether extract. Wash the combined ether extracts with four quantities, each of 100 ml, of water *R* and discard the washings.

To the ether solution add 40 ml of a 100 g/l solution of potassium ferricyanide *R* in an 8 g/l solution of sodium hydroxide *R* and shake for 3 min. Wash the ether solution with four quantities, each of 50 ml, of water *R*, discard the washings and dry the ether layer over anhydrous sodium sulphate *R*. Evaporate the ether on a water-bath under reduced pressure or in an atmosphere of nitrogen until a few millilitres remain, then complete the evaporation removing the last traces of ether without the application of heat. Immediately dissolve the residue in 25.0 ml of trimethylpentane *R* and determine the optical rotation.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (c).

Calculate the percentage content of $C_5H_4N_4O$ from the areas of the peaks and the declared content of *allopurinol CRS*.

IMPURITIES

Specified impurities: A, B, C, D, E.

- A. R1 = NH₂, R2 = H: 5-amino-1*H*-pyrazole-4-carboxamide,
 B. R1 = NH₂, R2 = CHO: 5-(formylamino)-1*H*-pyrazole-4-carboxamide,
 D. R1 = O-CH₂-CH₃, R2 = H: ethyl 5-amino-1*H*-pyrazole-4-carboxylate,
 E. R1 = O-CH₂-CH₃, R2 = CHO: ethyl 5-(formylamino)-1*H*-pyrazole-4-carboxylate,

- C. 5-(4*H*-1,2,4-triazol-4-yl)-1*H*-pyrazole-4-carboxamide.

corrected

ALMAGATE

Almagatum

Al₂Mg₆C₂O₂₀H₁₄·4H₂O

M_r 630

DEFINITION

Hydrated aluminium magnesium hydroxycarbonate.

Content:

- aluminium: 15.0 per cent to 17.0 per cent (calculated as Al₂O₃),
- magnesium: 36.0 per cent to 40.0 per cent (calculated as MgO),
- carbonic acid: 12.5 per cent to 14.5 per cent (calculated as CO₂).

CHARACTERS

Appearance: white or almost white, fine crystalline powder.

Solubility: practically insoluble in water, in alcohol and in methylene chloride. It dissolves with effervescence and heating in dilute mineral acids.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of almagate*.

- B. Dissolve 150 mg in *dilute hydrochloric acid R* and dilute to 20 ml with the same acid. 2 ml of the solution gives the reaction of aluminium (2.3.1).

- C. 2 ml of the solution prepared under identification test B gives the reaction of magnesium (2.3.1).

TESTS

pH (2.2.3): 9.1 to 9.7.

Disperse 4.0 g in 100 ml of *carbon dioxide-free water R*, stir for 2 min and filter.

Neutralising capacity. Carry out the test at 37 °C. Disperse 0.5 g in 100 ml of *water R*, heat, add 100.0 ml of 0.1 *M* *hydrochloric acid*, previously heated and stir continuously; the pH (2.2.3) of the solution between 5 min and 20 min is not less than 3.0 and not greater than 4.5. Add 10.0 ml of 0.5 *M* *hydrochloric acid*, previously heated, stir continuously for 1 h and titrate with 0.1 *M* *sodium hydroxide* to pH 3.5; not more than 20.0 ml of 0.1 *M* *sodium hydroxide* is required.

Chlorides (2.4.4): maximum 0.1 per cent.

Dissolve 0.33 g in 5 ml of *dilute nitric acid R* and dilute to 100 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides. Prepare simultaneously the standard by diluting 0.7 ml of *dilute nitric acid R* to 5 ml with *water R* and adding 10 ml of *chloride standard solution* (5 ppm Cl) *R*.

Sulphates (2.4.13): maximum 0.4 per cent.

Dissolve 0.25 g in 5 ml of *dilute hydrochloric acid R* and dilute to 100 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates. Prepare simultaneously the standard by adding 0.8 ml of *dilute hydrochloric acid R* to 15 ml of *sulphate standard solution* (10 ppm SO₄) *R*.

Sodium: maximum 150 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 0.25 g in 50 ml of a 103 g/l solution of *hydrochloric acid R*.

Reference solutions. Prepare the reference solutions using *sodium standard solution* (200 ppm Na) *R*, diluted as necessary with a 103 g/l solution of *hydrochloric acid R*.

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 1.0 g in *dilute hydrochloric acid R* and dilute to 20.0 ml with the same acid. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on ignition: 43.0 per cent to 49.0 per cent, determined on 1.000 g by ignition at 900 °C.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram determined by plate count. It complies with the tests for *Escherichia coli* and *Pseudomonas aeruginosa* (2.6.13).

ASSAY

Aluminium. Dissolve 1.000 g in 5 ml of *hydrochloric acid R*, heating if necessary. Allow to cool to room temperature and dilute to 100.0 ml with *water R* (solution A). Introduce 10.0 ml of solution A into a 250 ml conical flask, add 25.0 ml of 0.05 *M* *sodium edetate*, 20 ml of *buffer solution pH 3.5 R*, 40 ml of *ethanol R* and 2 ml of a freshly prepared 0.25 g/l solution of *dithizone R* in *ethanol R*. Titrate the excess of sodium edetate with 0.05 *M* *zinc sulphate* until the colour changes from greenish-violet to pink.

1 ml of 0.05 *M* *sodium edetate* is equivalent to 2.549 mg of Al₂O₃.

Magnesium. Introduce 10.0 ml of solution A prepared in the assay of aluminium into a 500 ml conical flask, add 200 ml of *water R*, 20 ml of *triethanolamine R* with shaking, 10 ml of

01/2005:1064

ammonium chloride buffer solution pH 10.0 R and 50 mg of *mordant black 11 triturate R*. Titrate with *0.05 M sodium edetate* until the colour changes from violet to pure blue.

1 ml of *0.05 M sodium edetate* is equivalent to 2.015 mg of MgO.

Carbonic acid: 12.5 per cent to 14.5 per cent.

Test sample. Place 7.00 mg of the substance to be examined in a tin capsule. Seal the capsule.

Reference sample. Place 7.00 mg of *almagate CRS* in a tin capsule. Seal the capsule.

Introduce separately the test sample and the reference sample into a combustion chamber of a CHN analyser purged with *helium for chromatography R* and maintained at a temperature of 1020 °C. Simultaneously, introduce *oxygen R* at a pressure of 276 kPa and a flow rate of 20 ml/min and allow complete combustion of the sample. Sweep the combustion gases through a reduction reactor and separate the gases formed by gas chromatography (2.2.28).

Column:

– *size:* $l = 2$ m, $\varnothing = 4$ mm,

– *stationary phase:* *ethylvinylbenzene-divinylbenzene copolymer R1*.

Carrier gas: *helium for chromatography R*.

Flow rate: 100 ml/min.

Temperature:

– *column:* 65 °C,

– *detector:* 190 °C.

Detection: thermal conductivity.

Run time: 16 min.

System suitability:

- average percentage of carbon in 5 reference samples must be within ± 0.2 per cent of the value assigned to the CRS. The difference between the upper and the lower values of the percentage of carbon in these samples must be below 0.2 per cent.

Calculate the percentage content of carbonic acid in the test sample according to the following formula:

$$C \times K \times \frac{A}{m}$$

- C = percentage content of carbonic acid in the reference sample,
- K = mean value for the 5 reference samples of the ratio of the mass in milligrams to the area of the peak due to carbonic acid,
- A = area of the peak due to carbonic acid in the chromatogram obtained with the test sample,
- m = sample mass, in milligrams.

STORAGE

In an airtight container.

ALMOND OIL, REFINED

Amygdalae oleum raffinatum

DEFINITION

Refined almond oil is the fatty oil from the ripe seeds of *Prunus dulcis* (Miller) D.A. Webb var. *dulcis* or *Prunus dulcis* (Miller) D.A. Webb var. *amara* (D.C.) Buchheim or a mixture of both varieties by cold expression. It is then refined. A suitable antioxidant may be added.

CHARACTERS

A pale yellow, clear liquid, slightly soluble in alcohol, miscible with light petroleum.

It solidifies at about -18 °C and has a relative density of about 0.916.

IDENTIFICATION

- A. Carry out the identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is comparable with the type chromatogram for almond oil.
- B. It complies with the test for composition of fatty acids (see Tests).

TESTS

Absorbance (2.2.25). Dissolve 0.100 g in *cyclohexane R* and dilute to 10.0 ml with the same solvent. The absorbance measured at the maximum between 264 nm and 276 nm is 0.2 to 6.0.

Acid value (2.5.1). Not more than 0.5, determined on 5.0 g.

Peroxide value (2.5.5). Not more than 5.0.

Unsaponifiable matter (2.5.7). Not more than 0.7 per cent, determined on 5.0 g.

Composition of fatty acids (2.4.22, Method A). The fatty acid fraction of the oil has the following composition:

- *saturated fatty acids of chain length less than C_{16}* : not more than 0.1 per cent,
- *palmitic acid*: 4.0 per cent to 9.0 per cent,
- *palmitoleic acid* (equivalent chain length on polyethyleneglycol adipate 16.3): not more than 0.6 per cent,
- *margaric acid*: not more than 0.2 per cent,
- *stearic acid*: not more than 3.0 per cent,
- *oleic acid* (equivalent chain length on polyethyleneglycol adipate 18.3): 62.0 per cent to 86.0 per cent,
- *linoleic acid* (equivalent chain length on polyethyleneglycol adipate 18.9): 20.0 per cent to 30.0 per cent,
- *linolenic acid* (equivalent chain length on polyethyleneglycol adipate 19.7): not more than 0.4 per cent,
- *arachidic acid*: not more than 0.2 per cent,
- *eicosenoic acid* (equivalent chain length on polyethyleneglycol adipate 20.3): not more than 0.3 per cent,
- *behenic acid*: not more than 0.2 per cent,
- *erucic acid* (equivalent chain length on polyethyleneglycol adipate 22.3): not more than 0.1 per cent.

Sterols. Carry out the test for sterols in fatty oils (2.4.23).

The sterol fraction of the oil has the following composition:

- *cholesterol*: not more than 0.7 per cent,
- *campesterol*: not more than 5.0 per cent,

- *stigmasterol*: not more than 4.0 per cent,
- *β-sitosterol*: 73.0 per cent to 87.0 per cent,
- *Δ⁵-avenasterol*: at least 5.0 per cent,
- *Δ⁷-avenasterol*: not more than 3.0 per cent,
- *Δ⁷-stigmastenol*: not more than 3.0 per cent,
- *brassicasterol*: not more than 0.3 per cent.

Water (2.5.32). If intended for use in the manufacture of parenteral dosage forms, not more than 0.1 per cent, determined on 5.00 g by the micro-determination of water.

STORAGE

Store in a well-filled container, protected from light.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- the name and concentration of any added antioxidant.

01/2005:0261

ALMOND OIL, VIRGIN

Amygdalae oleum virginale

DEFINITION

Virgin almond oil is the fatty oil obtained by cold expression from the ripe seeds of *Prunus dulcis* (Miller) D.A. Webb var. *dulcis* or *Prunus dulcis* (Miller) D.A. Webb var. *amara* (D.C.) Buchheim or a mixture of both varieties.

CHARACTERS

A yellow, clear, liquid, slightly soluble in alcohol, miscible with light petroleum.

It solidifies at about –18 °C and has a relative density of about 0.916.

IDENTIFICATION

First identification: A, C.

Second identification: A, B.

- It complies with the test for absorbance (see Tests).
- Carry out the identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is comparable with the type chromatogram for almond oil.
- It complies with the test for composition of fatty acids (see Tests).

TESTS

Absorbance (2.2.25). Dissolve 0.100 g in *cyclohexane R* and dilute to 10.0 ml with the same solvent. The absorbance measured at the maximum between 264 nm and 276 nm is not greater than 0.2. The ratio of the absorbance at 232 nm to that at 270 nm is greater than 7.

Acid value (2.5.1). Not more than 2.0, determined on 5.0 g.

Peroxide value (2.5.5). Not more than 15.0.

Unsaponifiable matter (2.5.7). Not more than 0.7 per cent, determined on 5.0 g.

Composition of fatty acids (2.4.22, *Method A*). The fatty acid fraction of the oil has the following composition:

- *saturated fatty acids of chain length less than C₁₆*: not more than 0.1 per cent,
- *palmitic acid*: 4.0 per cent to 9.0 per cent,
- *palmitoleic acid* (equivalent chain length on polyethyleneglycol adipate 16.3): not more than 0.6 per cent,

- *margaric acid*: not more than 0.2 per cent,
- *stearic acid*: not more than 3.0 per cent,
- *oleic acid* (equivalent chain length on polyethyleneglycol adipate 18.3): 62.0 per cent to 86.0 per cent,
- *linoleic acid* (equivalent chain length on polyethyleneglycol adipate 18.9): 20.0 per cent to 30.0 per cent,
- *linolenic acid* (equivalent chain length on polyethyleneglycol adipate 19.7): not more than 0.4 per cent,
- *arachidic acid*: not more than 0.2 per cent,
- *eicosenoic acid* (equivalent chain length on polyethyleneglycol adipate 20.3): not more than 0.3 per cent,
- *behenic acid*: not more than 0.2 per cent,
- *erucic acid* (equivalent chain length on polyethyleneglycol adipate 22.3): not more than 0.1 per cent.

Sterols. Carry out the test for sterols in fatty oils (2.4.23).

The sterol fraction of the oil has the following composition:

- *cholesterol*: not more than 0.7 per cent,
- *campesterol*: not more than 4.0 per cent,
- *stigmasterol*: not more than 3.0 per cent,
- *β-sitosterol*: 73.0 per cent to 87.0 per cent,
- *Δ⁵-avenasterol*: at least 10.0 per cent,
- *Δ⁷-avenasterol*: not more than 3.0 per cent,
- *Δ⁷-stigmastenol*: not more than 3.0 per cent,
- *brassicasterol*: not more than 0.3 per cent.

STORAGE

Store in a well-filled container, protected from light.

01/2005:0257

ALOES, BARBADOS

Aloe barbadensis

DEFINITION

Barbados aloes consists of the concentrated and dried juice of the leaves of *Aloe barbadensis* Miller. It contains not less than 28.0 per cent of hydroxyanthracene derivatives, expressed as barbaloin (C₂₁H₂₂O₉; *M_r* 418.4) and calculated with reference to the dried drug.

CHARACTERS

Dark brown masses, slightly shiny or opaque with a conchoidal fracture, or a brown powder, soluble in hot alcohol, partly soluble in boiling water.

IDENTIFICATION

- Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. To 0.25 g of the powdered drug add 20 ml of *methanol R* and heat to boiling in a water-bath. Shake for a few minutes and decant the solution. Store at about 4 °C and use within 24 h.

Reference solution. Dissolve 25 mg of *barbaloin R* in *methanol R* and dilute to 10 ml with the same solvent. Apply separately to the plate as bands 20 mm by not more than 3 mm 10 µl of each solution. Develop over a path of 10 cm using a mixture of 13 volumes of *water R*, 17 volumes of *methanol R* and 100 volumes of *ethyl acetate R*. Allow the plate to dry in air, spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R* and examine in ultraviolet light at 365 nm.

The chromatogram obtained with the test solution shows in the central part a zone of yellow fluorescence (barbaloin) similar in position to the zone corresponding to barbaloin in the chromatogram obtained with the reference solution and in the lower part a zone of light-blue fluorescence (aloesine). Heat the plate at 110 °C for 5 min. In the chromatogram obtained with the test solution, a zone of violet fluorescence appears just below the zone corresponding to barbaloin.

- B. Shake 1 g of the powdered drug with 100 ml of boiling *water R*. Cool, add 1 g of *talc R* and filter. To 10 ml of the filtrate add 0.25 g of *disodium tetraborate R* and heat to dissolve. Pour 2 ml of the solution into 20 ml of *water R*. Yellowish-green fluorescence appears which is particularly marked in ultraviolet light at 365 nm.
- C. To 5 ml of the filtrate obtained in identification test B add 1 ml of freshly prepared *bromine water R*. A brownish-yellow precipitate is formed and the supernatant liquid is violet.

TESTS

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 100 °C to 105 °C.

Total ash (2.4.16). Not more than 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Introduce 0.300 g of powdered drug (180) into a 250 ml conical flask. Moisten with 2 ml of *methanol R*, add 5 ml of *water R* warmed to about 60 °C, mix, add a further 75 ml of *water R* at about 60 °C and shake for 30 min. Cool, filter into a volumetric flask, rinse the conical flask and filter with 20 ml of *water R*, add the rinsings to the volumetric flask and dilute to 1000.0 ml with *water R*. Transfer 10.0 ml of this solution to a 100 ml round-bottomed flask containing 1 ml of a 600 g/l solution of *ferric chloride R* and 6 ml of *hydrochloric acid R*. Heat in a water-bath under a reflux condenser for 4 h, with the water level above that of the liquid in the flask. Allow to cool, transfer the solution to a separating funnel, rinse the flask successively with 4 ml of *water R*, 4 ml of 1 M *sodium hydroxide* and 4 ml of *water R* and add the rinsings to the separating funnel. Shake the contents of the separating funnel with three quantities, each of 20 ml, of *ether R*. Wash the combined ether layers with two quantities, each of 10 ml, of *water R*. Discard the washings and dilute the organic phase to 100.0 ml with *ether R*. Evaporate 20.0 ml carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 512 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene derivatives, as barbaloin, from the expression:

$$\frac{A \times 19.6}{m}$$

i.e. taking the specific absorbance of barbaloin to be 255.

A = absorbance at 512 nm,

m = mass of the substance to be examined in grams.

STORAGE

Store in an airtight container, protected from light.

01/2005:0258

ALOES, CAPE

Aloe capensis

DEFINITION

Cape aloes consists of the concentrated and dried juice of the leaves of various species of *Aloe*, mainly *Aloe ferox* Miller and its hybrids. It contains not less than 18.0 per cent of hydroxyanthracene derivatives, expressed as barbaloin ($C_{21}H_{22}O_9$; M_r 418.4) and calculated with reference to the dried drug.

CHARACTERS

Dark brown masses tinged with green and having a shiny conchoidal fracture, or a greenish-brown powder, soluble in hot alcohol, partly soluble in boiling water.

IDENTIFICATION

- A. Examine the chromatograms obtained in the test for Barbados aloes. The chromatogram obtained with the test solution shows in the central part a zone of yellow fluorescence (barbaloin) similar in position to the zone corresponding to barbaloin in the chromatogram obtained with the reference solution and in the lower part two zones of yellow fluorescence (aloinosides A and B) and a zone of blue fluorescence (aloesine).
- B. Shake 1 g of the powdered drug with 100 ml of boiling *water R*. Cool, add 1 g of *talc R* and filter. To 10 ml of the filtrate add 0.25 g of *disodium tetraborate R* and heat to dissolve. Pour 2 ml of the solution into 20 ml of *water R*. A yellowish-green fluorescence appears which is particularly marked in ultraviolet light at 365 nm.
- C. To 5 ml of the filtrate obtained in identification test B add 1 ml of freshly prepared *bromine water R*. A yellow precipitate is formed. The supernatant liquid is not coloured violet.

TESTS

Barbados aloes. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. To 0.25 g of the powdered drug add 20 ml of *methanol R* and heat to boiling in a water-bath. Shake for a few minutes and decant the solution. Store at about 4 °C and use within 24 h.

Reference solution. Dissolve 25 mg of *barbaloin R* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate as bands 20 mm by not more than 3 mm 10 µl of each solution. Develop over a path of 10 cm using a mixture of 13 volumes of *water R*, 17 volumes of *methanol R* and 100 volumes of *ethyl acetate R*. Allow the plate to dry in air, spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R*. Heat the plate at 110 °C for 5 min and examine in ultraviolet light at 365 nm. The chromatogram obtained with the test solution shows no zone of violet fluorescence just below the zone corresponding to barbaloin.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 100 °C to 105 °C.

Total ash (2.4.16). Not more than 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Introduce 0.400 g of powdered drug (180) into a 250 ml conical flask. Moisten with 2 ml of *methanol R*, add 5 ml of *water R* warmed to about 60 °C, mix, add a further 75 ml of *water R* at about 60 °C and shake for 30 min. Cool, filter into a volumetric flask, rinse the conical flask and filter with 20 ml of *water R*, add the rinsings to the volumetric flask and dilute to 1000.0 ml with *water R*. Transfer 10.0 ml of this solution to a 100 ml round-bottomed flask containing 1 ml of a 600 g/l solution of *ferric chloride R* and 6 ml of *hydrochloric acid R*. Heat in a water-bath under a reflux condenser for 4 h, with the water level above that of the liquid in the flask. Allow to cool, transfer the solution to a separating funnel, rinse the flask successively with 4 ml of *water R*, 4 ml of 1 M *sodium hydroxide* and 4 ml of *water R* and add the rinsings to the separating funnel. Shake the contents of the separating funnel with three quantities, each of 20 ml, of *ether R*. Wash the combined ether layers with two quantities, each of 10 ml, of *water R*. Discard the washings and dilute the organic phase to 100.0 ml with *ether R*. Evaporate 20.0 ml carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 512 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of barbaloin from the expression:

$$\frac{A \times 19.6}{m}$$

i.e. taking the specific absorbance of hydroxyanthracene derivatives, as barbaloin, to be 255.

A = absorbance at 512 nm,

m = mass of the substance to be examined in grams.

STORAGE

Store in an airtight container, protected from light.

01/2005:0259

ALOE DRY EXTRACT, STANDARDISED

Aloes extractum siccum normatum

DEFINITION

Standardised aloes dry extract is prepared from Barbados aloes or Cape aloes, or a mixture of the two, by treatment with boiling water. It is adjusted, if necessary, to contain not less than 19.0 per cent and not more than 21.0 per cent of hydroxyanthracene derivatives, expressed as barbaloin ($C_{21}H_{22}O_9$; M_r 418.4) and calculated with reference to the dried extract.

CHARACTERS

A brown or yellowish-brown powder, sparingly soluble in boiling water.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. To 0.25 g of the preparation to be examined add 20 ml of *methanol R* and heat to boiling in a water-bath. Shake for a few minutes and decant the solution. Store at about 4 °C and use within 24 h.

Reference solution. Dissolve 25 mg of *barbaloin R* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate as bands 20 mm by not more than 3 mm 10 µl of each solution. Develop over a path of 10 cm using a mixture of 13 volumes of *water R*, 17 volumes of *methanol R* and 100 volumes of *ethyl acetate R*. Allow the plate to dry in air, spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R* and examine in ultraviolet light at 365 nm. The chromatogram obtained with the test solution shows in the central part a zone of yellow fluorescence (barbaloin) similar in position to the zone corresponding to barbaloin in the chromatogram obtained with the reference solution and in the lower part there is a zone of light blue fluorescence (aloesine). In the lower part of the chromatogram obtained with the test solution two zones of yellow fluorescence (aloinosides A and B) (Cape aloes) and one zone of violet fluorescence just below the zone corresponding to barbaloin (Barbados aloes) may be present.

B. Shake 1 g of the preparation to be examined with 100 ml of boiling *water R*. Cool, add 1 g of *talc R* and filter. To 10 ml of the filtrate add 0.25 g of *disodium tetraborate R* and heat to dissolve. Pour 2 ml of the solution into 20 ml of *water R*. A yellowish-green fluorescence appears which is particularly marked in ultraviolet light at 365 nm.

TESTS

Loss on drying (2.8.17): maximum 4.0 per cent m/m .

Total ash (2.4.16). Not more than 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Introduce 0.400 g into a 250 ml conical flask. Moisten with 2 ml of *methanol R*, add 5 ml of *water R* warmed to about 60 °C, mix, add a further 75 ml of *water R* at about 60 °C and shake for 30 min. Cool, filter into a volumetric flask, rinse the conical flask and filter with 20 ml of *water R*, add the rinsings to the volumetric flask and dilute to 1000.0 ml with *water R*. Transfer 10.0 ml of this solution to a 100 ml round-bottomed flask containing 1 ml of a 600 g/l solution of *ferric chloride R* and 6 ml of *hydrochloric acid R*. Heat in a water-bath under a reflux condenser for 4 h, with the water level above that of the liquid in the flask. Allow to cool, transfer the solution to a separating funnel, rinse the flask successively with 4 ml of *water R*, 4 ml of 1 M *sodium hydroxide* and 4 ml of *water R*, and add the rinsings to the separating funnel. Shake the contents of the separating funnel with three quantities, each of 20 ml, of *ether R*. Wash the combined ether layers with two quantities, each of 10 ml, of *water R*. Discard the washings and dilute the organic phase to 100.0 ml with *ether R*. Evaporate 20.0 ml carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 512 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene derivatives, as barbaloin, from the expression:

$$\frac{A \times 19.6}{m}$$

i.e. taking the specific absorbance of barbaloin to be 255.

A = absorbance at 512 nm,

m = mass of the substance to be examined in grams.

01/2005:1065

ALPRAZOLAM**Alprazolamum** $C_{17}H_{13}ClN_4$ M_r 308.8**DEFINITION**

Alprazolam contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 8-chloro-1-methyl-6-phenyl-4*H*-[1,2,4]triazolo[4,3-*a*][1,4]benzodiazepine, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, practically insoluble in water, freely soluble in methylene chloride sparingly soluble in acetone and in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Dissolve the substance to be examined in the smallest necessary quantity of *ethyl acetate R* and evaporate to dryness on a water-bath. Thoroughly mix 5.0 mg of the substance to be examined with 5.0 mg of *alprazolam CRS*. The melting point (2.2.14) of the mixture does not deviate from the melting point of the substance to be examined by more than 2 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *alprazolam CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *ethyl acetate R*, evaporate to dryness on a water-bath and record new spectra using the residues. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *alprazolam CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *alprazolam CRS* and 10 mg of *midazolam CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path or 12 cm using a mixture of 2 volumes of *glacial acetic acid R*, 15 volumes of *water R*, 20 volumes of *methanol R* and 80 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the

chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separately spots.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *dimethylformamide R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *alprazolam CRS* and 2 mg of *triazolam CRS* in *dimethylformamide R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *dimethylformamide R*. Dilute 0.5 ml of this solution to 10.0 ml with *dimethylformamide R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *phenylsilyl silica gel for chromatography R1* (5 µm),
- as mobile phase at a flow rate of 2 ml/min and at a temperature of 40 °C a gradient programme using the following conditions:

Mobile phase A. A mixture of 44 volumes of buffer solution and 56 volumes of *methanol R*.

Mobile phase B. A mixture of 5 volumes of buffer solution and 95 volumes of *methanol R*.

Buffer solution. Dissolve 7.7 g of *ammonium acetate R* in 1000 ml of *water R* and adjust to pH 4.2 with *glacial acetic acid R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0	98	2	isocratic
15	98	2	begin linear gradient
35	1	99	begin isocratic
40	1	99	end chromatogram and switch to initial equilibration
41	98	2	begin equilibration
50 = 0	98	2	end equilibration

- as detector a spectrophotometer set at 254 nm.

Equilibrate the column for at least 30 min with the initial eluent composition. For subsequent chromatograms, use the conditions described from 40 min to 50 min. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions the retention times are: triazolam, about 9 min and alprazolam, about 10 min. The test is not valid unless the resolution between the peaks corresponding to alprazolam and triazolam is at least 1.5.

Inject separately 10 µl of *dimethylformamide R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution, the sum of the areas of the peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent). Disregard any peak in the chromatogram obtained with the blank and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.140 g in 50 ml of a mixture of 3 volumes of *anhydrous acetic acid R* and 2 volumes of *acetic anhydride R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20). Titrate to the second point of inflexion.

1 ml of 0.1 M perchloric acid is equivalent to 15.44 mg of $C_{17}H_{13}ClN_4$.

STORAGE

Store protected from light.

IMPURITIES

- A. (4*RS*)-3-amino-6-chloro-2-methyl-4-phenyl-3,4-dihydroquinazolin-4-ol,

- B. R = CH₂OH: [5-chloro-2-[3-(hydroxymethyl)-5-methyl-4*H*-1,2,4-triazol-4-yl]phenyl]phenylmethanone,

- C. R = H: [5-chloro-2-[3-methyl-4*H*-1,2,4-triazol-4-yl]phenyl]phenylmethanone,

- F. R = CH₂Cl: [5-chloro-2-[3-(chloromethyl)-5-methyl-4*H*-1,2,4-triazol-4-yl]phenyl]phenylmethanone,

- D. 8-chloro-1-ethenyl-6-phenyl-4*H*-[1,2,4]triazolo[4,3-*a*][1,4]benzodiazepine,

- H. bis[[4-(2-benzoyl-4-chlorophenyl)-5-methyl-4*H*-1,2,4-triazol-3-yl]methyl]amine,

- I. [5-chloro-2-[3-[(6*RS*)-8-chloro-6-hydroxy-1-methyl-6-phenyl-4*H*-[1,2,4]triazolo[4,3-*a*][1,4]benzodiazepin-5(6*H*)-yl]methyl]-5-methyl-4*H*-1,2,4-triazol-4-yl]phenyl]phenylmethanone,

- J. 2,17-dichloro-6,13-dimethyl-18*b*,19*a*-diphenyl-8*b*,19*a*-dihydro-10*H*,18*bH*-[1,2,4]triazolo[4''',3''':1'',2'']quinolo[3'',4'':4',5']oxazolo[3',2'-*d*']-1,2,4-triazolo[4,3-*a*][1,4]benzodiazepine.

01/2005:0876

ALPRENOLOL HYDROCHLORIDE

Alprenololi hydrochloridum

 $C_{15}H_{24}ClNO_2$ M_r 285.8

DEFINITION

Alprenolol hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*)-1-[(1-methylethylamino)-3-[2-(prop-2-enyl)phenoxy]propan-2-ol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, very soluble in water, freely soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (2.2.14): 108 °C to 112 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *alprenolol hydrochloride CRS*.

C. Examine the chromatograms obtained in test A for related substances in daylight, after exposure to iodine vapour for 30 min. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₉ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.2 ml of *methyl red solution R* and 0.2 ml of 0.01 *M hydrochloric acid*. The solution is red. Add 0.4 ml of 0.01 *M sodium hydroxide*. The solution is yellow.

1-Isopropylamino-3-(2-prop-1-enylphenoxy)propan-2-ol.

Dissolve 0.25 g in *alcohol R* and dilute to 25 ml with the same solvent. The absorbance (2.2.25) measured at 297 nm is not greater than 0.20 (0.1 per cent).

Related substances

A. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *alprenolol hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *alprenolol hydrochloride CRS* and 10 mg of *oxprenolol hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dilute 5 ml of test solution (b) to 50 ml with *methanol R*.

Place two beakers each containing 30 ml of *ammonia R* at the bottom of the chamber which is saturated with the mobile phase and *ammonia R* for at least 1 h before use. Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *methanol R* and 95 volumes of *ethyl acetate R*. Dry the plate at 100 °C for 15 min. Expose the plate to iodine vapour for up to 6 h. In the chromatogram obtained with test solution (a) any spot with an R_f value higher than that of the principal spot is not more intense than the spot in the chromatogram obtained with reference solution (c). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 4.0 mg of *alprenolol hydrochloride CRS* and 0.8 mg of 4-*isopropylphenol R* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 4.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: mix 0.656 g of *sodium octanesulphonate R* with 150 ml of *acetonitrile R* and dilute to 500 ml with phosphate buffer pH 2.8 (prepared from 1.78 g of *phosphoric acid R* and 15.6 g of *sodium dihydrogen phosphate R* diluted to 2000 ml with *water R*),
- as detector a spectrophotometer set at 280 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 1 h.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded under the prescribed conditions, the retention times are: *alprenolol hydrochloride* about 11 min; 4-*isopropylphenol* about 18 min. The test is not valid unless, in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to *alprenolol hydrochloride* and 4-*isopropylphenol* is at least 5; if necessary, adjust the concentration of sodium octanesulphonate and/or acetonitrile in the mobile phase (increase the concentration of sodium octanesulphonate to increase the retention time of *alprenolol hydrochloride* and increase the concentration of acetonitrile to decrease the retention times of both compounds).

01/2005:1488

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of any peaks apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). Dissolve 2.0 g in 20 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying over *diphosphorus pentoxide R* at a pressure not exceeding 2.7 kPa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 25 ml of a mixture of equal volumes of *ethanol R* and *water R*. Add 10 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 28.58 mg of $C_{15}H_{24}ClNO_2$.

STORAGE

Store protected from light.

IMPURITIES

A. R1 = OH, R2 = $CH_2-CH=CH_2$: (2*RS*)-3-[2-(prop-2-enyl)phenoxy]propan-1,2-diol,

C. R1 = $NH-CH(CH_3)_2$, R2 = $CH=CH-CH_3$: (2*RS*)-1-[(1-methylethyl)amino]-3-[2-(prop-1-enyl)phenoxy]propan-2-ol,

B. 2-(prop-2-enyl)phenol,

D. 1,1'-(1-methylethyl)imino]bis[3-[2-(prop-2-enyl)phenoxy]propan-2-ol].

ALPROSTADIL

Alprostadilum

 $C_{20}H_{34}O_5$
 M_r 354.5

DEFINITION

7-[(1*R*,2*R*,3*R*)-3-Hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoic acid.

Content: 95.0 per cent to 102.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or slightly yellowish, crystalline powder.

Solubility: practically insoluble in water, freely soluble in alcohol, soluble in acetone, slightly soluble in ethyl acetate.

IDENTIFICATION

A. Specific optical rotation (2.2.7): -60 to -70 (anhydrous substance).

Immediately before use, dissolve 50 mg in *alcohol R* and dilute to 10.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *alprostadil CRS*.

C. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions protected from light.

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 100 µl of the test solution to 20.0 ml with a mixture of equal volumes of *acetonitrile R1* and *water R*.

Reference solution (b). Dissolve 1.0 mg of *dinoprostone impurity C CRS* (alprostadil impurity H) and 1.0 mg of *alprostadil CRS* in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (c). In order to prepare *in situ* the degradation compounds (impurity A and impurity B), dissolve 1 mg of the substance to be examined in 100 µl of 1 M *sodium hydroxide* (the solution becomes brownish-red), wait for 3 min and add 100 µl of 1 M *phosphoric acid* (yellowish-white opalescent solution); dilute to 5.0 ml with a mixture of equal volumes of *acetonitrile R1* and *water R*.

System A

Column:

— *size*: $l = 0.25$ m, $\varnothing = 4.0$ mm,

- *stationary phase*: octylsilyl base-deactivated silica gel for chromatography R (4 µm) with a pore size of 6 nm,
- *temperature*: 35 °C.

Mobile phase:

- *mobile phase A*. Dissolve 3.9 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent; adjust to pH 2.5 with a 2.9 g/l solution of *phosphoric acid R* (approximately 600 ml is required); to 740 ml of the buffer solution add 260 ml of *acetonitrile R1*;
- *mobile phase B*. Dissolve 3.9 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent; adjust to pH 2.5 with a 2.9 g/l solution of *phosphoric acid R* (approximately 600 ml is required); to 200 ml of the buffer solution add 800 ml of *acetonitrile R1*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 75	100	0
75 - 76	100 → 0	0 → 100
76 - 86	0	100
86 - 87	0 → 100	100 → 0
87 - 102	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 200 nm.

Injection: 20 µl loop injector.

System suitability:

- *retention time*: alprostadil = about 63 min,
- *resolution*: minimum of 1.5 between the peaks due to impurity H and alprostadil in the chromatogram obtained with reference solution (b).

System B

Use the same conditions as for system A with the following mobile phase and elution programme:

- *mobile phase A*. Dissolve 3.9 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent; adjust to pH 2.5 with a 2.9 g/l solution of *phosphoric acid R* (approximately 600 ml is required); to 600 ml of the buffer solution add 400 ml of *acetonitrile R1*;
- *mobile phase B*. Use mobile phase B as described under system A;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 50	100	0
50 - 51	100 → 0	0 → 100
51 - 61	0	100
61 - 62	0 → 100	100 → 0
62 - 72	100	0

System suitability:

- *relative retentions* with reference to alprostadil (retention time = about 7 min): impurity A = about 2.4; impurity B = about 2.6,
- *resolution*: minimum of 1.5 between the peaks due to impurity A and impurity B in the chromatogram obtained with reference solution (c).

Carry out the test according to system A and B.

Limits:

- *correction factors*: multiply the areas of the corresponding peaks using the correction factors in Table 1488-1 to obtain the corrected areas,

Table 1488-1

Impurity	Relative retention (system A)	Relative retention (system B)	Correction factor
impurity G	0.80	-	0.7
impurity F	0.88	-	0.8
impurity D	0.90	-	1.0
impurity H	0.96	-	0.7
impurity E	1.10	-	0.7
impurity C	-	1.36	1.9
impurity K	-	1.85	0.06
impurity A	-	2.32	0.7
impurity B	-	2.45	1.5
impurity I	-	4.00	1.0
impurity J	-	5.89	1.0

- *impurity A (corrected area)*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent),
- *impurity B (corrected area)*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *any other impurity (corrected area)*: not more than 1.8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.9 per cent), and not more than 1 such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Evaluate impurities appearing at relative retentions less than 1.2 by system A and impurities appearing at relative retentions greater than 1.2 by system B,
- *total (corrected area)*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.5.32): maximum 0.5 per cent, determined on 50 mg.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances, system A. *Prepare the solutions protected from light.*

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 25.0 ml with the same mixture of solvents. Dilute 3.0 ml of the solution to 20.0 ml with a mixture of equal volumes of *acetonitrile R1* and *water R*.

Reference solution. Dissolve 10.0 mg of *alprostadil CRS* in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 25.0 ml with the same mixture of solvents. Dilute 3.0 ml of the solution to 20.0 ml with a mixture of equal volumes of *acetonitrile R1* and *water R*.

Injection: 20 µl.

Calculate the percentage content of C₂₀H₃₄O₅.

STORAGE

At a temperature of 2 °C to 8 °C.

IMPURITIES

A. 7-[(1*R*,2*S*)-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopent-3-enyl]heptanoic acid (prostaglandin A₁),

B. 7-[2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopent-1-enyl]heptanoic acid (prostaglandin B₁),

C. 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*)-3-oxooct-1-enyl]-5-oxocyclopentyl]heptanoic acid (15-oxoprostaglandin E₁),

D. 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*R*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoic acid (15-epiprostaglandin E₁),

E. 7-[(1*R*,2*R*,3*S*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoic acid (11-epiprostaglandin E₁),

F. 7-[(1*S*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoic acid (8-epiprostaglandin E₁),

G. (5*Z*)-7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid (dinoprostone),

H. (5*E*)-7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid ((5*E*)-prostaglandin E₂),

I. R = CH₂-CH₃: ethyl 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoate (prostaglandin E₁, ethyl ester),

J. R = CH(CH₃)₂: 1-methylethyl 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]heptanoate (prostaglandin E₁, isopropyl ester),

K. triphenylphosphine oxide.

DEFINITION

Alteplase for injection is a sterile, freeze-dried preparation of alteplase, a tissue plasminogen activator produced by recombinant DNA technology. It has a potency of not less than 500 000 IU per milligram of protein.

Tissue plasminogen activator binds to fibrin clots and activates plasminogen, leading to the generation of plasmin and to the degradation of fibrin clots or blood coagulates.

Alteplase consists of 527 amino acids with a calculated relative molecular mass of 59 050 without consideration of the carbohydrate moieties attached at positions Asn 117, Asn 184 and Asn 448. The total relative molecular mass is approximately 65 000. Alteplase is cleaved by plasmin between amino-acids 275 and 276 into a two-chain form (A chain and B chain) that are connected by a disulphide bridge between Cys 264 and Cys 395. The single-chain form and the two-chain form show comparable fibrinolytic activity *in vitro*.

PRODUCTION

Alteplase is produced by recombinant DNA synthesis in cell culture; the fermentation takes place in serum-free medium.

The purification process is designed to remove efficiently potential impurities, such as antibiotics, DNA and protein contaminants derived both from the host cell and from the production medium, and potential viral contaminants.

If alteplase is stored in bulk form, stability (maintenance of potency) in the intended storage conditions must be demonstrated.

The production, purification and product consistency are checked by a number of analytical methods described below, carried out routinely as in-process controls.

Protein content. The protein concentration of alteplase solutions is determined by measuring the absorbance (2.2.25) of the protein solution at 280 nm and at 320 nm, using formulation buffer as the compensation liquid. If

dilution of alteplase samples is necessary, the samples are diluted in formulation buffer. For the calculation of the alteplase concentration the absorbance value ($A_{280} - A_{320}$) is divided by the specific absorption coefficient for alteplase of 1.9.

Potency. The potency of alteplase is determined in an *in-vitro* clot-lysis assay as described under Assay. The specific activity of bulk alteplase is approximately 580 000 IU per milligram of alteplase.

N-terminal sequence. N-terminal sequencing is applied to determine the correct N-terminal sequence and to determine semiquantitatively additional cleavage sites in the alteplase molecule, for example at position AA 275-276 or at position AA 27-28. The N-terminal sequence must conform with the sequence of human tissue plasminogen activator.

Isoelectric focusing. The consistency in the microheterogeneity of glycosylation of the alteplase molecule can be demonstrated by isoelectric focusing (IEF). A complex banding pattern with ten major and several minor bands in the pH range 6.5-8.5 is observed. Denaturing conditions are applied to achieve a good separation of differently charged variants of alteplase. The broad charge distribution observed is due to a population of molecules, which differ in the fine structure of biantennary and triantennary complex-type carbohydrate residues, with different degrees of substitution with sialic acids. The banding pattern of alteplase test samples must be consistent with the pattern of alteplase reference standard.

Single-chain alteplase content. The alteplase produced by CHO (Chinese hamster ovary) cells in serum-free medium is predominantly single-chain alteplase. The single-chain form can be separated from the two-chain form by gel-permeation liquid chromatography under reducing conditions as described under Single-chain content (see Tests). The single-chain alteplase content in bulk samples must be higher than 60 per cent.

Tryptic-peptide mapping. The primary structure of the alteplase molecule is verified by tryptic-peptide mapping as described under Identification B. The reduced and carboxymethylated molecule is cleaved by trypsin into about fifty peptides, which are separated by reverse-phase liquid chromatography. A characteristic chromatogram (fingerprint) is obtained. The identity of the tryptic-peptide map of a given alteplase sample with the profile of a well-characterised reference standard is an indirect confirmation of the amino-acid sequence, because even single amino-acid exchanges in individual peptides can be detected by this sensitive technique. In addition, complex peaks of the glycopeptides can be isolated from the tryptic-peptide map and separated in a second dimension, either by reverse-phase liquid chromatography under modified conditions or by capillary electrophoresis. By this two-dimensional separation of glycopeptide variants, lot-to-lot consistency of the microheterogeneity of glycosylation can be demonstrated.

The tryptic-peptide map of alteplase samples must be consistent with the tryptic-peptide map of alteplase reference standard.

Monomer content. The monomer content of alteplase is measured by gel-permeation liquid chromatography under non-reduced conditions as described under Monomer content (see Tests). The monomer content of alteplase bulk samples must be higher than 95 per cent.

Type I/Type II alteplase content. CHO cells produce two glycosylation variants of alteplase. Type I alteplase contains one polymannose-type glycosylation at position Asn 117 and

two complex-type glycosylation sites at positions Asn 184 and Asn 448. Type II alteplase is only glycosylated at positions Asn 117 and Asn 448.

The ratio of Type I/Type II alteplase is constant in the range of 45 to 65 per cent of Type I and 35 to 55 per cent of Type II. The content of alteplase Type I and Type II can be determined by a densitometric scan of SDS-PAGE (sodium dodecyl sulphate polyacrylamide gel electrophoresis) gel. Plasmin-treated samples of alteplase, which are reduced and carboxymethylated before loading on the gel, are separated into three bands: Type I alteplase A-chain (AA 1-275), Type II alteplase A-chain (AA 1-275) and alteplase B-chain (AA 276-527). The ratio of Type I/Type II alteplase is determined from a calibration curve, which is obtained by a densitometric scan of defined mixtures of purified Type I alteplase and Type II alteplase standards.

SDS-PAGE. SDS-PAGE (silver staining) is used to demonstrate purity of the alteplase bulk material and the integrity of the alteplase molecule. For alteplase bulk samples, no additional protein bands compared to reference standard or degradation products must occur in SDS-PAGE gels at a loading amount of 2.5 µg alteplase protein per lane and a limit of detection of 5 ng per protein (BSA) band.

Bacterial endotoxins (2.6.14): less than 1 IU per milligram of alteplase.

Sialic acids. Dialyse samples and alteplase reference standard against enzyme buffer (8.9 g/l *sodium chloride R*, 4.1 g/l *sodium acetate R*, pH 5.5) using a membrane with a cut-off point corresponding to a relative molecular mass of 10 000 for globular proteins. After dialysis, determine the protein concentration. Add 5 µl of calcium chloride solution (19.98 per cent *m/m calcium chloride R*) to 1 ml of protein solution. Add 10 milliunits of neuraminidase per milligram of protein. Incubate this solution at 37 °C for about 17 h.

Prepare standard dilutions between 1.56 mg/ml and 25.0 mg/ml from an *N-acetylneuraminic acid R* reference stock solution with a concentration of 50 mg/ml. Pipette 0.2 ml of the sample and of the protein reference standard in duplicate into reagent tubes. Pipette also 0.2 ml of the standard dilutions into reagent tubes. Add 0.25 ml of periodate reagent (5.4 g/l solution of *sodium periodate R* in a 1.25 per cent *V/V* solution of *sulphuric acid R*), mix and incubate for 30 min at 37 °C. Add 0.2 ml of arsenite reagent (20 g/l solution of *sodium arsenite R* in a 1.55 per cent *V/V* solution of *hydrochloric acid R*) and mix. A yellowish-brown colour develops and disappears. Add 2.0 ml of a 28.9 g/l solution of *thiobarbituric acid R* and mix. Heat the closed tubes in boiling water for 7.5 min and then cool them in an ice-bath for 5 min. Add 2.0 ml of a mixture of *butanol R* and *hydrochloric acid R* (95:5) and mix. Centrifuge the tubes at 3000 r/min for 3 min. Measure the absorbance of the butanol-HCl layer at 552 nm within 30 min using the butanol-HCl mixture as the compensation solution. Perform a linear-regression analysis for the *N-acetylneuraminic acid* standard. The molar content of *N-acetylneuraminic acid* for the samples and for alteplase reference standard is calculated from the calibration curve. The sialic acids content for the test samples must be within the range 70 to 130 per cent of alteplase reference standard, which contains about 3 moles of sialic acids per mole of alteplase.

Neutral sugars. Dilute alteplase samples and the reference standard in the assay buffer, containing 34.8 g/l of *arginine R*, 0.1 g/l of *polysorbate 80 R* and adjusted to pH 7.4 with *phosphoric acid R*, to a protein concentration of 50 µg/ml. Prepare the following concentrations of mannose in the same assay buffer for a calibration curve: 20, 30, 40, 50 and 60 µg/ml. Pipette 2 ml of alteplase samples

and reference standard, as well as 2 ml of each mannose concentration in duplicate in reagent tubes. Add 50 µl of *phenol R*, followed by 5 ml of *sulphuric acid R* in each reagent tube. Incubate the mixture for 30 min at room temperature. Measure the absorbance at 492 nm for each tube. Read the content of neutral sugars from the mannose calibration curve. The neutral sugar content is expressed in moles of neutral sugar per mole of alteplase, taking into account the dilution factor for alteplase samples and reference standard and using a relative molecular mass of 180.2 for mannose and a relative molecular mass of 59 050 for the alteplase protein moiety. The neutral sugar content of the alteplase samples must be in the range of 70 to 130 per cent compared to alteplase reference standard, which contains about 12 moles of neutral sugar per mole of alteplase.

CHARACTERS

A white or slightly yellow powder or solid friable mass.

Reconstitute the preparation as stated on the label immediately before carrying out the Identification, Tests (except those for solubility and water) and Assay.

IDENTIFICATION

A. The assay serves also to identify the preparation.

B. Tryptic-peptide mapping. Examine by liquid chromatography (2.2.29).

Test solution. Dilute the preparation to be examined with *water R* to obtain a solution containing about 1 mg of alteplase per millilitre. Dialyse about 2.5 ml of the solution for at least 12 h into a solution containing 480 g/l of *urea R*, 44 g/l of *tris(hydroxymethyl)aminomethane R* and 1.5 g/l of *disodium edetate R* and adjusted to pH 8.6, using a membrane with a cut-off point corresponding to a relative molecular mass of 10 000 for globular proteins. Measure the volume of the solution, transfer it to a clean test-tube and add per millilitre 10 µl of a 156 g/l solution of *dithiothreitol R*. Allow to stand for 4 h, cool in iced water and add per millilitre of solution 25 µl of a freshly prepared 190 g/l solution of *iodoacetic acid R*. Allow to stand in the dark for 30 min. Add per millilitre 50 µl of *dithiothreitol* solution to stop the reaction. Dialyse for 24 h against an 8 g/l solution of *ammonium hydrogen carbonate R*. Add 1 part of *trypsin for peptide mapping R* to 100 parts of the protein and allow to stand for 6 h to 8 h. Repeat the addition of trypsin and allow to stand for a total of 24 h.

Reference solution. Prepare as for the test solution using *alteplase CRS* instead of the preparation to be examined.

The chromatographic procedure may be carried out using:

- a column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm to 10 µm),
Mobile phase A. A 8 g/l solution of *sodium dihydrogen phosphate R*, adjusted to pH 2.85 with *phosphoric acid R*, filtered and degassed,
Mobile phase B. *Acetonitrile R* 75 per cent *V/V* in mobile phase A,
- as detector a spectrophotometer set at 210 nm.

Equilibrate the system with mobile phase A at a flow rate of 1 ml/min. After injection of the solution, increase the proportion of mobile phase B at a rate of 0.44 per cent per minute until the ratio of mobile phase A to mobile phase B is 60:40 and then increase the proportion of mobile phase B at a rate of 1.33 per cent per minute until the ratio of mobile phase A to mobile phase B is 20:80

and then continue elution with this mixture for a further 10 min. Record the chromatogram for the reference solution: the test is not valid unless the resolution of peaks 6 (peptides 268-275) and 7 (peptides 1-7) is at least 1.5; $b_{0.5a}$ and $b_{0.5b}$ are not more than 0.4 min. Inject about 100 µl of the test solution and record the chromatogram. Verify the identity of the peaks by comparison with the chromatograms of the reference solution. There should not be any additional significant peaks or shoulders, a significant peak or shoulder being defined as one with an area response equal to or greater than 5 per cent of peak 19 (peptides 278-296); no significant peak is missing. A type chromatogram for identification of the peaks cited is given at the end of the monograph (see Figure 1170.-1).

TESTS

Appearance of solution. The reconstituted preparation is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, Method II).

pH (2.2.3): 7.1 to 7.5.

Solubility. Add the volume of the liquid stated on the label. The preparation dissolves completely within 2 min at 20 °C to 25 °C.

Protein content. Prepare a solution of the substance to be examined with an accurately known concentration of about 1 g/l. Using a 34.8 g/l solution of *arginine R* adjusted to pH 7.3 with *phosphoric acid R*, dilute an accurately measured volume of the solution of the substance to be examined so that the absorbance measured at the maximum at about 280 nm is 0.5 to 1.0 (*test solution*). Measure the absorbance (2.2.25) of the solution at the maximum at about 280 nm and at 320 nm using the arginine solution as the compensation liquid. Calculate the protein content in the portion of alteplase taken from the expression:

$$\frac{V(A_{280} - A_{320})}{1.9}$$

in which V is the volume of arginine solution required to prepare the test solution, A_{280} is the absorbance at the maximum at about 280 nm and A_{320} is the absorbance at 320 nm.

Single-chain content. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve the preparation to be examined in *water R* to obtain a solution containing about 1 mg of alteplase per millilitre. Place about 1 ml of the solution in

a tube, add 3 ml of a 3 g/l solution of *dithiothreitol R* in the mobile phase, place a cap on the tube and heat at about 80 °C for 3 min to 5 min.

The chromatographic procedure may be carried out using:

- a column 0.6 m long and 7.5 mm in internal diameter packed with silica-based rigid, hydrophilic gel with spherical particles 10 µm to 13 µm in diameter, suitable for size-exclusion chromatography,
- as mobile phase at a flow rate of 0.5 ml/min a solution containing 30 g/l of *sodium dihydrogen phosphate R* and 1 g/l of *sodium dodecyl sulphate R*, adjusted to pH 6.8 with *dilute sodium hydroxide solution R*,
- as detector a spectrophotometer set at 214 nm.

Inject about 50 µl of the test solution and record the chromatogram. The chromatogram shows two major peaks corresponding to single-chain and two-chain alteplase. Calculate the relative amount of single-chain alteplase from the peak area values.

The test is not valid unless: the number of theoretical plates calculated on the basis of the single-chain alteplase peak is at least 1000. The content of single-chain alteplase is not less than 60 per cent of the total amount of alteplase-related substances found.

Monomer content. Examine by liquid chromatography (2.2.29).

Test solution. Reconstitute the preparation to be examined to obtain a solution containing about 1 mg per millilitre.

The chromatographic procedure may be carried out using:

- a column 0.6 m long and 7.5 mm in internal diameter packed with silica-based rigid, hydrophilic gel with spherical particles 10 µm to 13 µm in diameter, suitable for size-exclusion chromatography,
- as mobile phase at a flow rate of 0.5 ml/min a solution containing 30 g/l of *sodium dihydrogen phosphate R* and 1 g/l of *sodium dodecyl sulphate R*, adjusted to pH 6.8 with *dilute sodium hydroxide solution R*,
- as detector a spectrophotometer set at 214 nm.

Inject the test solution and record the chromatogram. The test is not valid unless the number of theoretical plates calculated for the alteplase monomer peak is at least 1000. Measure the response for all peaks, i.e. peaks corresponding to alteplase species of different molecular masses. Calculate the relative content of monomer from the area values of these peaks. The monomer content for alteplase must be at least 95 per cent.

Figure 1170.-1. – Chromatogram for tryptic-peptide mapping of alteplase

Water (2.5.12). Not more than 4.0 per cent, determined by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 1 IU per milligram of protein.

Sterility (2.6.1). It complies with the test for sterility.

ASSAY

The potency of alteplase is determined by comparing its ability to activate plasminogen to form plasmin with the same capacity of a reference preparation calibrated in International Units. The formation of plasmin is measured by the determination of the lysis time of a fibrin clot in given conditions.

The International Unit is the activity of a stated quantity of the International Standard of alteplase. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Solvent buffer. A solution containing 1.38 g/l of *sodium dihydrogen phosphate monohydrate R*, 7.10 g/l of *anhydrous disodium hydrogen phosphate R*, 0.20 g/l of *sodium azide R* and 0.10 g/l of *polysorbate 80 R*.

Human thrombin solution. A solution of *human thrombin R* containing 33 IU/ml in solvent buffer.

Human fibrinogen solution. A 2 g/l solution of *fibrinogen R* in solvent buffer.

Human plasminogen solution. A 1 g/l solution of *human plasminogen R* in solvent buffer.

Test solutions. Using a solution of the substance to be examined containing 1 g/l, prepare serial dilutions using solvent buffer, for example 1:5000, 1:10 000, 1:20 000.

Reference solutions. Using a solution of *alteplase CRS* having an accurately known concentration of about 1 g/l (580 000 IU of alteplase per millilitre), prepare five serial dilutions using *water R* to obtain reference solutions having known concentrations in the range 9.0 IU/ml to 145 IU/ml.

To each of a set of labelled glass test-tubes, add 0.5 ml of human thrombin solution. Allocate each test and reference solution to a separate tube and add to each tube 0.5 ml of the solution allocated to it. To each of a second set of labelled glass tubes, add 20 µl of human plasminogen solution, and 1 ml of human fibrinogen solution, mix and store on ice. Beginning with the reference/thrombin mixture containing the lowest number of International Units per millilitre, record the time and separately add 200 µl of each of the thrombin mixtures to the test tubes containing the plasminogen-fibrinogen mixture. Using a vortex mixture, intermittently mix the contents of each tube for a total of 15 s and carefully place in a rack in a circulating water-bath at 37 °C. A visibly turbid clot forms within 30 s and bubbles subsequently form within the clot. Record the clot-lysis time as the time between the first addition of alteplase solution and the moment when the last bubble rises to the surface. Using a least-squares fit, determine the equation of the line using the logarithms of the concentrations of the reference preparation in International Units per millilitre versus the logarithms of the values of their clot-lysis times in seconds, according to the equation:

$$\log t = a + b(\log U_s)$$

in which t is the clot-lysis time, U_s the activity in International Units per millilitre of the reference preparation, b is the slope and a the y -intercept of the line. The test is not valid unless the correlation coefficient is -0.9900 to -1.0000 . From the line equation and the clot-lysis time for the test solution, calculate the logarithm of the activity U_A from the equation:

$$\log U_A = \frac{[(\log t) - a]}{b}$$

Calculate the alteplase activity in International Units per millilitre from the expression:

$$D \times U_A$$

in which D is the dilution factor for the test solution. Calculate the specific activity in the portion of the substance to be examined from the expression:

$$\frac{U_A}{P}$$

in which P is the concentration of protein obtained in the test for protein content.

The estimated potency is not less than 90 per cent and not more than 110 per cent of the stated potency.

STORAGE

Store in a colourless, glass container, under vacuum or under an inert gas, protected from light, at a temperature between 2 °C and 30 °C.

LABELLING

The label states:

- the number of International Units per container,
- the amount of protein per container.

01/2005:0006

ALUM

Alumen

M_r 474.4

DEFINITION

Alum contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

CHARACTERS

A granular powder or colourless, transparent, crystalline masses, freely soluble in water, very soluble in boiling water, soluble in glycerol, practically insoluble in alcohol.

IDENTIFICATION

- A. Solution S (see Tests) gives the reactions of sulphates (2.3.1).
- B. Solution S gives the reaction of aluminium (2.3.1).
- C. Shake 10 ml of solution S with 0.5 g of *sodium bicarbonate R* and filter. The filtrate gives reaction (a) of potassium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 3.0 to 3.5.

Ammonium (2.4.1). To 1 ml of solution S add 4 ml of *water R*. Dilute 0.5 ml of the solution to 14 ml with the same solvent. The solution complies with the limit test for ammonium (0.2 per cent).

Iron (2.4.9). 2 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (100 ppm). Use in this test 0.3 ml of *thioglycollic acid R*.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 0.900 g in 20 ml of *water R* and carry out the complexometric titration of aluminium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 47.44 mg of $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

01/2005:0971

ALUMINIUM CHLORIDE HEXAHYDRATE

Aluminii chloridum hexahydricum

$\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$

M_r 241.4

DEFINITION

Aluminium chloride hexahydrate contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$.

CHARACTERS

A white or slightly yellow, crystalline powder or colourless crystals, deliquescent, very soluble in water, freely soluble in alcohol, soluble in glycerol.

IDENTIFICATION

- Dilute 0.1 ml of solution S2 (see Tests) to 2 ml with *water R*. The solution gives reaction (a) of chlorides (2.3.1).
- Dilute 0.3 ml of solution S2 to 2 ml with *water R*. The solution gives the reaction of aluminium (2.3.1).

TESTS

Solution S1. Dissolve 10.0 g in *distilled water R* and dilute to 100 ml with the same solvent.

Solution S2. Dilute 50 ml of solution S1 to 100 ml with *water R*.

Appearance of solution. Solution S2 is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, *Method II*).

Sulphates (2.4.13). 15 ml of solution S1 complies with the limit test for sulphates (100 ppm).

Iron (2.4.9). 10 ml of solution S1 complies with the limit test for iron (10 ppm).

Alkali and alkaline-earth metals. To 20 ml of solution S2 add 100 ml of *water R* and heat to boiling. To the hot solution add 0.2 ml of *methyl red solution R*. Add *dilute ammonia RI* until the colour of the indicator changes to yellow and dilute to 150 ml with *water R*. Heat to boiling and filter. Evaporate 75 ml of the filtrate to dryness on a water-bath and ignite to constant mass. The residue weighs not more than 2.5 mg (0.5 per cent).

Heavy metals (2.4.8). 12 ml of solution S1 complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (2.5.12): 42.0 per cent to 48.0 per cent, determined on 50.0 mg by the semi-micro determination of water.

ASSAY

Dissolve 0.500 g in 25.0 ml of *water R*. Carry out the complexometric titration of aluminium (2.5.11). Titrate with 0.1 M *zinc sulphate* until the colour of the indicator changes from greyish-green to pink. Carry out a blank titration.

1 ml of 0.1 M *sodium edetate* is equivalent to 24.14 mg of $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$.

STORAGE

Store in an airtight container.

01/2005:1664

ALUMINIUM HYDROXIDE, HYDRATED, FOR ADSORPTION

Aluminii hydroxidum hydricum
ad adsorptionem

$[\text{AlO}(\text{OH})]_n \cdot n\text{H}_2\text{O}$

DEFINITION

Content: 90.0 per cent to 110.0 per cent of the content of aluminium stated on the label.

NOTE: shake the gel vigorously for at least 30 s immediately before examining.

CHARACTERS

Appearance: white or almost white, translucent, viscous, colloidal gel. A supernatant may be formed upon standing.

Solubility: a clear or almost clear solution is obtained with alkali hydroxide solutions and mineral acids.

IDENTIFICATION

Solution S (see Tests) gives the reaction of aluminium.

To 10 ml of solution S add about 0.5 ml of *dilute hydrochloric acid R* and about 0.5 ml of *thioacetamide reagent R*. No precipitate is formed. Add dropwise 5 ml of *dilute sodium hydroxide solution R*. Allow to stand for 1 h. A gelatinous white precipitate is formed which dissolves upon addition of 5 ml of *dilute sodium hydroxide solution R*. Gradually add 5 ml of *ammonium chloride solution R* and allow to stand for 30 min. The gelatinous white precipitate is re-formed.

TESTS

Solution S. Add 1 g to 4 ml of *hydrochloric acid R*. Heat at 60 °C for 1 h, cool, dilute to 50 ml with *distilled water R* and filter if necessary.

pH (2.2.3): 5.5 to 8.5.

Adsorption power. Dilute the substance to be examined with *distilled water R* to obtain an aluminium concentration of 5 mg/ml. Prepare *bovine albumin R* solutions with the following concentrations of bovine albumin: 0.5 mg/ml, 1 mg/ml, 2 mg/ml, 3 mg/ml, 5 mg/ml and 10 mg/ml. If necessary, adjust the gel and the *bovine albumin R* solutions to pH 6.0 with *dilute hydrochloric acid R* or *dilute sodium hydroxide solution R*.

For adsorption, mix 1 part of the diluted gel with 4 parts of each of the solutions of *bovine albumin R* and allow to stand at room temperature for 1 h. During this time shake the mixture vigorously at least 5 times. Centrifuge or filter through a non-protein-retaining filter. Immediately determine the protein content (2.5.33, *Method 2*) of either the supernatant or the filtrate.

Iron (2.4.9). 2 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (100 ppm). Use in this test 0.3 ml of *thioglycollic acid R*.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 0.900 g in 20 ml of *water R* and carry out the complexometric titration of aluminium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 47.44 mg of $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

01/2005:0971

ALUMINIUM CHLORIDE HEXAHYDRATE

Aluminii chloridum hexahydricum

$\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$

M_r 241.4

DEFINITION

Aluminium chloride hexahydrate contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$.

CHARACTERS

A white or slightly yellow, crystalline powder or colourless crystals, deliquescent, very soluble in water, freely soluble in alcohol, soluble in glycerol.

IDENTIFICATION

- A. Dilute 0.1 ml of solution S2 (see Tests) to 2 ml with *water R*. The solution gives reaction (a) of chlorides (2.3.1).
- B. Dilute 0.3 ml of solution S2 to 2 ml with *water R*. The solution gives the reaction of aluminium (2.3.1).

TESTS

Solution S1. Dissolve 10.0 g in *distilled water R* and dilute to 100 ml with the same solvent.

Solution S2. Dilute 50 ml of solution S1 to 100 ml with *water R*.

Appearance of solution. Solution S2 is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, *Method II*).

Sulphates (2.4.13). 15 ml of solution S1 complies with the limit test for sulphates (100 ppm).

Iron (2.4.9). 10 ml of solution S1 complies with the limit test for iron (10 ppm).

Alkali and alkaline-earth metals. To 20 ml of solution S2 add 100 ml of *water R* and heat to boiling. To the hot solution add 0.2 ml of *methyl red solution R*. Add *dilute ammonia RI* until the colour of the indicator changes to yellow and dilute to 150 ml with *water R*. Heat to boiling and filter. Evaporate 75 ml of the filtrate to dryness on a water-bath and ignite to constant mass. The residue weighs not more than 2.5 mg (0.5 per cent).

Heavy metals (2.4.8). 12 ml of solution S1 complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (2.5.12): 42.0 per cent to 48.0 per cent, determined on 50.0 mg by the semi-micro determination of water.

ASSAY

Dissolve 0.500 g in 25.0 ml of *water R*. Carry out the complexometric titration of aluminium (2.5.11). Titrate with 0.1 M *zinc sulphate* until the colour of the indicator changes from greyish-green to pink. Carry out a blank titration.

1 ml of 0.1 M *sodium edetate* is equivalent to 24.14 mg of $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$.

STORAGE

Store in an airtight container.

01/2005:1664

ALUMINIUM HYDROXIDE, HYDRATED, FOR ADSORPTION

Aluminii hydroxidum hydricum
ad adsorptionem

$[\text{AlO}(\text{OH})]_n \cdot n\text{H}_2\text{O}$

DEFINITION

Content: 90.0 per cent to 110.0 per cent of the content of aluminium stated on the label.

NOTE: shake the gel vigorously for at least 30 s immediately before examining.

CHARACTERS

Appearance: white or almost white, translucent, viscous, colloidal gel. A supernatant may be formed upon standing.

Solubility: a clear or almost clear solution is obtained with alkali hydroxide solutions and mineral acids.

IDENTIFICATION

Solution S (see Tests) gives the reaction of aluminium.

To 10 ml of solution S add about 0.5 ml of *dilute hydrochloric acid R* and about 0.5 ml of *thioacetamide reagent R*. No precipitate is formed. Add dropwise 5 ml of *dilute sodium hydroxide solution R*. Allow to stand for 1 h. A gelatinous white precipitate is formed which dissolves upon addition of 5 ml of *dilute sodium hydroxide solution R*. Gradually add 5 ml of *ammonium chloride solution R* and allow to stand for 30 min. The gelatinous white precipitate is re-formed.

TESTS

Solution S. Add 1 g to 4 ml of *hydrochloric acid R*. Heat at 60 °C for 1 h, cool, dilute to 50 ml with *distilled water R* and filter if necessary.

pH (2.2.3): 5.5 to 8.5.

Adsorption power. Dilute the substance to be examined with *distilled water R* to obtain an aluminium concentration of 5 mg/ml. Prepare *bovine albumin R* solutions with the following concentrations of bovine albumin: 0.5 mg/ml, 1 mg/ml, 2 mg/ml, 3 mg/ml, 5 mg/ml and 10 mg/ml. If necessary, adjust the gel and the *bovine albumin R* solutions to pH 6.0 with *dilute hydrochloric acid R* or *dilute sodium hydroxide solution R*.

For adsorption, mix 1 part of the diluted gel with 4 parts of each of the solutions of *bovine albumin R* and allow to stand at room temperature for 1 h. During this time shake the mixture vigorously at least 5 times. Centrifuge or filter through a non-protein-retaining filter. Immediately determine the protein content (2.5.33, *Method 2*) of either the supernatant or the filtrate.

It complies with the test if no bovine albumin is detectable in the supernatant or filtrate of the 2 mg/ml *bovine albumin R* solution (maximum level of adsorption) and in the supernatant or filtrate of *bovine albumin R* solutions of lower concentrations. Those containing 3 mg/ml, 5 mg/ml and 10 mg/ml *bovine albumin R* solutions may show bovine albumin in the supernatant or filtrate, proportional to the amount of bovine albumin in the solutions.

Sedimentation. If necessary, adjust the substance to be examined to pH 6.0 using *dilute hydrochloric acid R* or *dilute sodium hydroxide solution R*. Dilute with *distilled water R* to obtain an aluminium concentration of approximately 5 mg/ml. If the aluminium content of the substance to be examined is lower than 5 mg/ml, adjust to pH 6.0 and dilute with a 9 g/l solution of *sodium chloride R* to obtain an aluminium concentration of about 1 mg/ml. After shaking for at least 30 s, place 25 ml of the preparation in a 25 ml graduated cylinder and allow to stand for 24 h.

It complies with the test if the volume of the clear supernatant is less than 5 ml for the gel with an aluminium content of about 5 mg/ml.

It complies with the test if the volume of the clear supernatant is less than 20 ml for the gel with an aluminium content of about 1 mg/ml.

Chlorides (2.4.4): maximum 0.33 per cent.

Dissolve 0.5 g in 10 ml of *dilute nitric acid R* and dilute to 500 ml with *water R*.

Nitrates: maximum 100 ppm.

Place 5 g in a test-tube immersed in ice-water, add 0.4 ml of a 100 g/l solution of *potassium chloride R*, 0.1 ml of *diphenylamine solution R* and, dropwise with shaking, 5 ml of *sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 5 ml of *nitrate standard solution (100 ppm NO₃) R*.

Sulphates (2.4.13): maximum 0.5 per cent.

Dilute 2 ml of solution S to 20 ml with *water R*.

Ammonium (2.4.1): maximum 50 ppm.

1.0 g complies with limit test B. Prepare the standard using 0.5 ml of *ammonium standard solution (100 ppm NH₄) R*.

Arsenic (2.4.2, Method A): maximum 1 ppm, determined on 1 g.

Iron (2.4.9): maximum 10 ppm, determined on 1 g.

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 2.0 g in 10 ml of *dilute nitric acid R* and dilute to 20 ml with *water R*. The solution complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Bacterial endotoxins (2.6.14): less than 5 IU of endotoxin per milligram of aluminium, if intended for use in the manufacture of an adsorbed product without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 10.00 g in 10 ml of *hydrochloric acid R1*, heating on a water-bath. Cool and dilute to 20 ml with *water R*. To 10 ml of the solution, add *dilute ammonia R1* until a precipitate is obtained. Add the smallest quantity of *dilute hydrochloric acid R* needed to dissolve the precipitate and dilute to 20 ml with *water R*. Carry out the complexometric titration of aluminium (2.5.11). Carry out a blank titration.

STORAGE

At a temperature not exceeding 30 °C. Do not allow to freeze. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- where applicable, that the substance is free from bacterial endotoxins,
- the declared content of aluminium.

01/2005:1388

ALUMINIUM MAGNESIUM SILICATE

Aluminii magnesii silicas

DEFINITION

Aluminium magnesium silicate is a mixture of particles with colloidal particle size of montmorillonite and saponite, free from grit and nonswellable ore. It contains not less than 95.0 per cent and not more than 105.0 per cent of the amount of aluminium and magnesium stated on the label.

CHARACTERS

Almost white powder, granules or plates, practically insoluble in water and in organic solvents.

It swells in water to produce a colloidal dispersion.

IDENTIFICATION

- Fuse 1 g with 2 g of *anhydrous sodium carbonate R*. Warm the residue with *water R* and filter. Acidify the filtrate with *hydrochloric acid R* and evaporate to dryness on a water-bath. 0.25 g of the residue gives the reaction of silicates (2.3.1).
- Dissolve the remainder of the residue obtained in identification test A in a mixture of 5 ml of *dilute hydrochloric acid R* and 10 ml of *water R*. Filter and add *ammonium chloride buffer solution pH 10.0 R*. A white, gelatinous precipitate is formed. Centrifuge, keep the supernatant for identification C. Dissolve the remaining precipitate in *dilute hydrochloric acid R*. The solution gives the reaction of aluminium (2.3.1).
- The supernatant liquid obtained after centrifugation in identification test B gives the reaction of magnesium (2.3.1).

TESTS

pH (2.2.3). Disperse 5.0 g in 100 ml of *carbon dioxide-free water R*. The pH of the dispersion is 9.0 to 10.0.

Arsenic (2.4.2). Transfer 16.6 g to a 250 ml beaker containing 100 ml of *dilute hydrochloric acid R*. Mix, cover with a watch glass and boil gently, with occasional stirring, for 15 min. Allow the insoluble matter to settle and decant the supernatant liquid through a rapid-flow filter paper into a 250 ml volumetric flask, retaining as much sediment as possible in the beaker. To the residue in the beaker add 25 ml of hot *dilute hydrochloric acid R*, stir, heat to boiling, allow the insoluble matter to settle and decant the supernatant liquid through the filter into the volumetric flask. Repeat the extraction with four additional quantities, each of 25 ml, of hot *dilute hydrochloric acid R*, decanting each supernatant liquid through the filter into the volumetric flask. At the last extraction, transfer as much of the insoluble matter as possible onto the filter. Allow to cool the combined filtrates to room temperature and dilute to 250.0 ml with *dilute*

hydrochloric acid R. Dilute 5.0 ml of the solution to 25.0 ml with *dilute hydrochloric acid R*. The solution complies with limit test A for arsenic (3 ppm).

Lead. Not more than 15 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Transfer 10.0 g to a 250 ml beaker containing 100 ml of *dilute hydrochloric acid R*. Mix, cover with a watch glass and boil for 15 min. Allow to cool to room temperature and allow the insoluble matter to settle. Decant the supernatant liquid through a rapid-flow filter paper into a 400 ml beaker. To the insoluble matter in the 250 ml beaker add 25 ml of hot *water R*. Stir, allow the insoluble matter to settle and decant the supernatant liquid through the filter into the 400 ml beaker. Repeat the extraction with two additional quantities, each of 25 ml, of *water R*, decanting each supernatant liquid through the filter into the 400 ml beaker. Wash the filter with 25 ml of hot *water R*, collecting this filtrate in the 400 ml beaker. Concentrate the combined filtrates by gently boiling to about 20 ml. If a precipitate appears, add about 0.1 ml of *nitric acid R*, heat to boiling and allow to cool to room temperature. Filter the concentrated extracts through a rapid-flow filter paper into a 50 ml volumetric flask. Transfer the remaining contents of the 400 ml beaker through the filter paper and into the flask with *water R*. Dilute to 50.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *lead standard solution (10 ppm Pb) R*, diluted if necessary with *water R*.

Measure the absorbance at 217 nm, using a lead hollow-cathode lamp as source of radiation and an oxidising air-acetylene flame.

Loss on drying (2.2.32). Not more than 8.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^3 micro-organisms per gram determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

ASSAY

Aluminium. Determine by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. In a platinum crucible mix 0.200 g with 1.0 g of *lithium metaborate R*. Heat slowly at first and ignite at 1000 °C to 1200 °C for 15 min. Cool, place the crucible in a 100 ml beaker containing 25 ml of *dilute nitric acid R* and add an additional 50 ml of *dilute nitric acid R*, filling and submerging the crucible. Place a polytetrafluoroethylene coated magnetic stirring bar in the crucible and stir gently with a magnetic stirrer until dissolution is complete. Pour the contents into a 250 ml beaker and remove the crucible. Warm the solution and transfer through a rapid-flow filter paper into a 250 ml volumetric flask, wash the filter and beaker with *water R* and dilute to 250.0 ml with *water R* (solution A). To 20.0 ml of this solution add 20 ml of a 10 g/l solution of *sodium chloride R* and dilute to 100.0 ml with *water R*.

Reference solutions. Dissolve 1.000 g of *aluminium R* in a mixture of 10 ml of *hydrochloric acid R* and 10 ml of *water R* by gentle heating. Cool and dilute to 1000.0 ml with *water R* (1 mg of aluminium per millilitre). Into three identical volumetric flasks, each containing 0.20 g of *sodium chloride R*, introduce 2.0 ml, 5.0 ml and 10.0 ml of the solution, respectively and dilute to 100.0 ml with *water R*. Measure the absorbance at 309 nm using an aluminium hollow-cathode lamp as the source of radiation and an oxidising acetylene-nitrous oxide flame.

Calculate the content of aluminium in the substance to be examined.

Magnesium. Determine by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dilute 25.0 ml of solution A, prepared in the assay for aluminium, to 50.0 ml with *water R*. To 5.0 ml of this solution add 20.0 ml of *lanthanum nitrate solution R* and dilute to 100.0 ml with *water R*.

Reference solutions. Place 1.000 g of *magnesium R* in a 250 ml beaker containing 20 ml of *water R* and carefully add 20 ml of *hydrochloric acid R*, warming if necessary to dissolve. Transfer the solution to a volumetric flask and dilute to 1000.0 ml with *water R* (1 mg of magnesium per millilitre). Dilute 5.0 ml of the solution to 250.0 ml with *water R*. Into four identical volumetric flasks, introduce 5.0 ml, 10.0 ml, 15.0 ml and 20.0 ml of the solution, respectively. To each flask add 20.0 ml of *lanthanum nitrate solution R* and dilute to 100.0 ml with *water R*.

Measure the absorbance at 285 nm using a magnesium hollow-cathode lamp as source of radiation and a reducing air-acetylene flame.

Calculate the content of magnesium in the substance to be examined.

LABELLING

The label states the content of aluminium and magnesium.

01/2005:0311

ALUMINIUM OXIDE, HYDRATED

Aluminii oxidum hydricum

DEFINITION

Hydrated aluminium oxide contains the equivalent of not less than 47.0 per cent and not more than 60.0 per cent of Al_2O_3 (M_r 102.0).

CHARACTERS

A white, amorphous powder, practically insoluble in water. It dissolves in dilute mineral acids and in solutions of alkali hydroxides.

IDENTIFICATION

Solution S (see Tests) gives the reaction of aluminium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in 15 ml of *hydrochloric acid R*, heating on a water-bath. Dilute to 100 ml with *distilled water R*.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution GY₆ (2.2.2, *Method II*).

Alkaline impurities. Shake 1.0 g with 20 ml of *carbon dioxide-free water R* for 1 min and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. Any pink colour disappears on the addition of 0.3 ml of 0.1 M *hydrochloric acid*.

Neutralising capacity. Carry out the test at 37 °C. Disperse 0.5 g in 100 ml of *water R*, heat, add 100.0 ml of 0.1 M *hydrochloric acid*, previously heated, and stir continuously; the pH (2.2.3) of the solution after 10 min, 15 min and 20 min is not less than 1.8, 2.3 and 3.0 respectively and is at no time greater than 4.5. Add 10.0 ml of 0.5 M *hydrochloric acid*, previously heated, stir continuously for 1 h and titrate with 0.1 M *sodium hydroxide* to pH 3.5; not more than 35.0 ml of 0.1 M *sodium hydroxide* is required.

Chlorides (2.4.4). Dissolve 0.1 g with heating in 10 ml of *dilute nitric acid R* and dilute to 100 ml with *water R*. 5 ml of the solution diluted to 15 ml with *water R* complies with the limit test for chlorides (1 per cent).

Sulphates (2.4.13). Dilute 4 ml of solution S to 100 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates (1 per cent).

Arsenic (2.4.2). 10 ml of solution S complies with limit test A for arsenic (4 ppm).

Heavy metals (2.4.8). Neutralise 20 ml of solution S with *concentrated ammonia R*, using *metanil yellow solution R* as an external indicator. Filter, if necessary, and dilute to 30 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (60 ppm). Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^3 micro-organisms per gram, determined by plate count. It complies with the tests for enterobacteria and certain other gram-negative bacteria and with the test for *Escherichia coli* (2.6.13).

ASSAY

Dissolve 0.800 g in 10 ml of *hydrochloric acid R1*, heating on a water-bath. Cool and dilute to 50.0 ml with *water R*. To 10.0 ml of the solution, add *dilute ammonia R1* until a precipitate begins to appear. Add the smallest quantity of *dilute hydrochloric acid R* needed to dissolve the precipitate and dilute to 20 ml with *water R*. Carry out the complexometric titration of aluminium (2.5.11).

1 ml of 0.1 M sodium edetate is equivalent to 5.098 mg of Al_2O_3 .

STORAGE

Store in an airtight container, at a temperature below 30 °C.

01/2005:1598

ALUMINIUM PHOSPHATE, HYDRATED

Aluminii phosphas hydricus

$\text{AlPO}_4 \cdot x \text{H}_2\text{O}$ M_r 122.0 (anhydrous substance)

DEFINITION

Content: 94.0 per cent to 102.0 per cent of AlPO_4 (M_r 122.0) (ignited substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: very slightly soluble in water, practically insoluble in alcohol. It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

- Solution S (see Tests) gives reaction (b) of phosphates (2.3.1).
- Solution S gives the reaction of aluminium (2.3.1).

TESTS

Solution S. Dissolve 2.00 g in *dilute hydrochloric acid R* and dilute to 100 ml with the same acid.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3): 5.5 to 7.2

Shake 4.0 g with *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Chlorides (2.4.4): maximum 1.3 per cent.

Dissolve 50.0 mg in 10 ml of *dilute nitric acid R* and dilute to 200 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides.

Soluble phosphates: maximum 1.0 per cent, calculated as PO_4^{3-} .

Test solution. Stir 5.0 g with 150 ml of *water R* for 2 h. Filter and wash the filter with 50 ml of *water R*. Combine the filtrate and the washings and dilute to 250.0 ml with *water R*. Dilute 10.0 ml of this solution to 100.0 ml with *water R*.

Reference solution (a). Dissolve 2.86 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 1 ml of reference solution (a) to 5 ml with *water R*.

Reference solution (c). Dilute 3 ml of reference solution (a) to 5 ml with *water R*.

Treat each solution as follows. To 5.0 ml add 4 ml of *dilute sulphuric acid R*, 1 ml of *ammonium molybdate solution R*, 5 ml of *water R* and 2 ml of a solution containing 0.10 g of 4-methylaminophenol sulphate R, 0.5 g of anhydrous sodium sulphite R and 20.0 g of sodium metabisulphite R in 100 ml of *water R*. Shake and allow to stand for 15 min. Dilute to 25.0 ml with *water R* and allow to stand for a further 15 min. Measure the absorbance (2.2.25) at 730 nm. Calculate the content of soluble phosphates from a calibration curve prepared using reference solutions (a), (b) and (c) after treatment.

Sulphates (2.4.13): maximum 0.6 per cent.

Dilute 8 ml of solution S to 100 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates.

Arsenic (2.4.2): maximum 1 ppm.

1.0 g complies with limit test A.

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 1.0 g in *dilute hydrochloric acid R* and dilute to 20 ml with the same acid. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on ignition. 10.0 per cent to 20.0 per cent, determined on 1.000 g at 800 °C.

Neutralising capacity. Add 0.50 g to 30 ml of 0.1 M *hydrochloric acid* previously heated to 37 °C and maintain at this temperature for 15 min while stirring. The pH (2.2.3) of the mixture after 15 min at 37 °C is 2.0 to 2.5.

ASSAY

Dissolve 0.400 g in 10 ml of *dilute hydrochloric acid R* and dilute to 100.0 ml with *water R*. To 10.0 ml of the solution, add 10.0 ml of 0.1 M sodium edetate and 30 ml of a mixture of equal volumes of *ammonium acetate solution R* and *dilute acetic acid R*. Boil for 3 min, then cool. Add 25 ml of *alcohol R* and 1 ml of a freshly prepared 0.25 g/l solution of *dithizone R* in *alcohol R*. Titrate the excess of sodium edetate with 0.1 M *zinc sulphate* until the colour changes to pink.

1 ml of 0.1 M sodium edetate is equivalent to 12.20 mg of AlPO_4 .

STORAGE

In an airtight container.

01/2005:0463
corrected

ALUMINIUM SULPHATE

Aluminii sulfas

DEFINITION

Aluminium sulphate contains not less than 51.0 per cent and not more than the equivalent of 59.0 per cent of $\text{Al}_2(\text{SO}_4)_3$ (M_r 342.1). It contains a variable quantity of water of crystallisation.

CHARACTERS

Colourless, lustrous crystals or crystalline masses, soluble in cold water, freely soluble in hot water, practically insoluble in alcohol.

IDENTIFICATION

- A. Solution S (see Tests) gives reaction (a) of sulphates (2.3.1).
B. Solution S gives the reaction of aluminium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension III (2.2.1) and is colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent. The pH of the solution is 2.5 to 4.0.

Alkali and alkaline-earth metals. To 20 ml of solution S add 100 ml of *water R*, heat and add 0.1 ml of *methyl red solution R*. Add *dilute ammonia R1* until the colour of the indicator changes to yellow. Dilute to 150 ml with *water R*, heat to boiling and filter. Evaporate 75 ml of the filtrate to dryness on a water-bath and ignite. The residue weighs not more than 2 mg (0.4 per cent).

Ammonium (2.4.1). 0.4 ml of solution S diluted to 14 ml with *water R* complies with the limit test for ammonium (500 ppm).

Iron (2.4.9). 2 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (100 ppm). Use 0.3 ml of *thioglycollic acid R* in this test.

Heavy metals (2.4.8). Dilute 8 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (50 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 0.500 g in 20 ml of *water R*. Carry out the complexometric titration of aluminium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 17.11 mg of $\text{Al}_2(\text{SO}_4)_3$.

STORAGE

Store in an airtight container.

AMANTADINE HYDROCHLORIDE

Amantadini hydrochloridum

 $\text{C}_{10}\text{H}_{18}\text{ClN}$ M_r 187.7

DEFINITION

Amantadine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of tricyclo[3.3.1.1^{3,7}]decan-1-amine hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water and in alcohol. It sublimes on being heated.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *amantadine hydrochloride CRS*. Examine the substances prepared as discs.
B. To 0.1 g add 1 ml of *pyridine R*, mix and add 0.1 ml of *acetic anhydride R*. Heat to boiling for about 10 s. Pour the hot solution into 10 ml of *dilute hydrochloric acid R*, cool to 5 °C and filter. The precipitate, washed with *water R* and dried *in vacuo* at 60 °C for 1 h, melts (2.2.14) at 147 °C to 151 °C.
C. Dissolve 0.2 g in 1 ml of 0.1 M *hydrochloric acid*. Add 1 ml of a 500 g/l solution of *sodium nitrite R*. A white precipitate is formed.
D. 1 ml of solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Acidity or alkalinity. Dilute 2 ml of solution S to 10 ml with *carbon dioxide-free water R*. Add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is red.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 0.10 g of the substance to be examined in 2 ml of *water R*. Add 2 ml of a 200 g/l solution of *sodium hydroxide R* and 2 ml of *chloroform R*. Shake for 10 min. Separate the chloroform layer, dry over *anhydrous sodium sulphate R* and filter.

The chromatographic procedure may be carried out using:

- a glass column 1.8 m long and 2 mm in internal diameter with a packing prepared as follows: mix 19.5 g of *silanised diatomaceous earth for gas chromatography R* with 60 ml of a 3.3 g/l solution of *potassium hydroxide R* in *methanol R* and evaporate the solvent under reduced

pressure while rotating the mixture slowly (support); dissolve 0.4 g of *low-vapour-pressure hydrocarbons (type L) R* in 60 ml of *toluene R* (dissolution requires up to 5 h), add this solution to the support and evaporate the solvent under reduced pressure while rotating the mixture slowly,

- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector.

Programme the temperature of the column linearly at a rate of 6 °C per minute from 100 °C to 200 °C. Maintain the temperature of the injection port at 220 °C and that of the detector at 300 °C. Inject 1 µl or the chosen volume of the test solution. Continue the chromatography for a period at least 2.5 times the retention time of the principal peak. In the chromatogram the sum of the area of any peaks apart from that corresponding to amantadine does not exceed 1 per cent of the total area of the peaks; no peak, apart from that corresponding to amantadine, has an area exceeding 0.3 per cent of the total area. Disregard the peak corresponding to the solvent during the evaluation.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 2.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in a mixture of 5.0 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 18.77 mg of C₁₃H₁₈ClN.

01/2005:1489

AMBROXOL HYDROCHLORIDE

Ambroxoli hydrochloridum

C₁₃H₁₉Br₂ClN₂O*M*_r 414.6

DEFINITION

trans-4-[(2-Amino-3,5-dibromobenzyl)amino]cyclohexanol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish crystalline powder.

Solubility: sparingly soluble in water, soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dissolve 20.0 mg in 0.05 M *sulphuric acid* and dilute to 100.0 ml with the same acid. Dilute 2.0 ml of the solution to 10.0 ml with 0.05 M *sulphuric acid*. Examined between 200 nm and 350 nm (2.2.25), the solution shows two absorption maxima at 245 nm and 310 nm. The ratio of the absorbance measured at 245 nm to that measured at 310 nm is 3.2 to 3.4.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *ambroxol hydrochloride CRS*.

C. Examine by thin-layer chromatography (2.2.27).

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 50 mg of *ambroxol hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Plate: *TLC silica gel F₂₅₄ plate R*.

Mobile phase: concentrated *ammonia R*, 1-propanol *R*, *ethyl acetate R*, *hexane R* (1:10:20:70 V/V/V/V).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve 25 mg in 2.5 ml of *water R*, mix with 1.0 ml of dilute *ammonia R1* and allow to stand for 5 min. Filter and acidify the filtrate with dilute *nitric acid R*. The filtrate gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.75 g in *methanol R* and dilute to 15 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

pH (2.2.3): 4.5 to 6.0.

Dissolve 0.2 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of the test solution to 250.0 ml with *water R*. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of the substance to be examined in 0.2 ml of *methanol R* and add 0.04 ml of a mixture of 1 volume of *formaldehyde solution R* and 99 volumes of *water R*. Heat at 60 °C for 5 min. Evaporate to dryness under a current of nitrogen. Dissolve the residue in 5 ml of *water R* and dilute to 20 ml with the mobile phase.

Column:

- **size:** *l* = 0.25 m, Ø = 4.0 mm,
- **stationary phase:** *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: a mixture of equal volumes of *acetonitrile R* and a solution prepared as follows: dissolve 1.32 g of *ammonium phosphate R* in 900 ml of *water R*, adjust to pH 7.0 with *phosphoric acid R* and dilute to 1000 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 248 nm.

Injection: 20 µl.

Sensitivity: reference solution (a).

Run time: 3 times the retention time of the principal peak in the chromatogram obtained with the test solution.

System suitability:

- *resolution:* minimum of 4.0 between the peaks due to impurity B and amroxol in the chromatogram obtained with reference solution (b).

Limits:

- *any impurity:* not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total:* not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *disregard limit:* 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 70 ml of *alcohol R* and add 5 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 41.46 mg of C₁₃H₁₉Br₂ClN₂O.

STORAGE

Store protected from light.

IMPURITIES

A. Ar-CH₂OH: (2-amino-3,5-dibromophenyl)methanol,

B. *trans*-4-(6,8-dibromo-1,4-dihydroquinazolin-3(2H)-yl)cyclohexanol,

C. *trans*-4-[(*E*)-2-amino-3,5-dibromobenzyliden]amino]cyclohexanol,

D. *cis*-4-[(2-amino-3,5-dibromobenzyl)amino]cyclohexanol,

E. Ar-CH=O: 2-amino-3,5-dibromobenzaldehyde.

01/2005:0368

AMFETAMINE SULPHATE

Amfetamini sulfas

C₁₈H₂₈N₂O₄S

M_r 368.5

DEFINITION

Amfetamine sulphate contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of bis[(2*RS*)-1-phenylpropan-2-amine] sulphate, calculated with reference to the dried substance.

CHARACTERS

A white powder, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

- The angle of optical rotation (2.2.7) of solution S (see Tests), measured in a 2 dm tube, is –0.04 to +0.04.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of amfetamine sulphate*. Examine as a mull in *liquid paraffin R*.
- To 50 ml of solution S add 5 ml of *strong sodium hydroxide solution R* and 0.5 ml of *benzoyl chloride R* and shake. Continue to add *benzoyl chloride R* in portions of 0.5 ml until no further precipitate is formed. Filter, wash the precipitate with *water R* and recrystallise twice from a mixture of equal volumes of *alcohol R* and *water R* and dry at 100 °C to 105 °C. The crystals melt (2.2.14) at 131 °C to 135 °C.
- To about 2 mg add 1 ml of *sulphuric acid-formaldehyde reagent R*. An orange colour develops and quickly becomes dark-brown.
- Solution S gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 25 ml of solution S add 0.1 ml of *methyl red solution R*. Not more than 0.1 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 36.85 mg of $C_{18}H_{28}N_2O_4S$.

STORAGE

Store protected from light.

01/2005:0873

AMIDOTRIZOIC ACID DIHYDRATE

Acidum amidotrizoicum dihydricum

 $C_{11}H_9I_3N_2O_4 \cdot 2H_2O$
 M_r 650

DEFINITION

Amidotrizoic acid dihydrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 3,5-bis(acetylamino)-2,4,6-triodobenzoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *amidotrizoic acid dihydrate CRS*.
- Examine the chromatograms obtained in the test for related substances (see Tests). The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).
- Heat 50 mg gently in a small porcelain dish over a naked flame. Violet vapour is evolved.

TESTS

Appearance of solution. Dissolve 1.0 g in *dilute sodium hydroxide solution R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.50 g of the substance to be examined in a 3 per cent V/V solution of *ammonia R* in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a 3 per cent V/V solution of *ammonia R* in *methanol R*.

Reference solution (a). Dilute 1 ml of test solution (b) to 50 ml with a 3 per cent V/V solution of *ammonia R* in *methanol R*.

Reference solution (b). Dissolve 50 mg of *amidotrizoic acid dihydrate CRS* in a 3 per cent V/V solution of *ammonia R* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *anhydrous formic acid R*, 25 volumes of *methyl ethyl ketone R* and 60 volumes of *toluene R*. Allow the plate to dry until the solvents have evaporated and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent).

Halides. Dissolve 0.55 g in a mixture of 4 ml of *dilute sodium hydroxide solution R* and 15 ml of *water R*. Add 6 ml of *dilute nitric acid R* and filter. 15 ml of the filtrate complies with the limit test for chlorides (2.4.4) (150 ppm expressed as chloride).

Free aromatic amines. *Maintain the solutions and reagents in iced water protected from bright light.* To 0.50 g in a 50 ml volumetric flask add 15 ml of *water R*. Shake and add 1 ml of *dilute sodium hydroxide solution R*. Cool in iced water, add 5 ml of a freshly prepared 5 g/l solution of *sodium nitrite R* and 12 ml of *dilute hydrochloric acid R*. Shake gently and allow to stand for exactly 2 min after adding the hydrochloric acid. Add 10 ml of a 20 g/l solution of *ammonium sulphamate R*. Allow to stand for 5 min, shaking frequently, and add 0.15 ml of a 100 g/l solution of *α-naphthol R* in *alcohol R*. Shake and allow to stand for 5 min. Add 3.5 ml of *buffer solution pH 10.9 R*, mix and dilute to 50.0 ml with *water R*. The absorbance (2.2.25), measured within 20 min at 485 nm using as the compensation liquid a solution prepared at the same time and in the same manner but omitting the substance to be examined, is not greater than 0.30.

Heavy metals (2.4.8). Dissolve 2.0 g in 4 ml of *dilute sodium hydroxide solution R* and dilute to 20 ml with *water R*. 12 ml of this solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Loss on drying (2.2.32): 4.5 per cent to 7.0 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

To 0.150 g in a 250 ml round-bottomed flask add 5 ml of *strong sodium hydroxide solution R*, 20 ml of *water R*, 1 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 20 ml of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 40 ml of *dilute sulphuric acid R* and titrate immediately with 0.1 M *silver nitrate*. Determine the end-point potentiometrically (2.2.20), using a suitable electrode system such as silver-mercurous sulphate.

1 ml of 0.1 M *silver nitrate* is equivalent to 20.47 mg of $C_{11}H_9I_3N_2O_4$.

STORAGE

Store protected from light.

IMPURITIES

A. 3-(acetylamino)-5-amino-2,4,6-triiodobenzoic acid.

01/2005:1289

AMIKACIN

Amikacinum

 $C_{22}H_{43}N_5O_{13}$ M_r 585.6

DEFINITION

Amikacin is 6-*O*-(3-amino-3-deoxy- α -D-glucopyranosyl)-4-*O*-(6-amino-6-deoxy- α -D-glucopyranosyl)-1-*N*-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-D-streptamine, an antimicrobial substance obtained from kanamycin A. It contains not less than 96.5 per cent and not more than the equivalent of 102.5 per cent of $C_{22}H_{43}N_5O_{13}$, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, sparingly soluble in water, slightly soluble in methanol, practically insoluble in acetone and in alcohol.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum of *amikacin CRS*.
- Examine by thin-layer chromatography (2.2.27) using a *TLC silica gel plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *amikacin CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *kanamycin monosulphate CRS* in 1 ml of the test solution and dilute to 10 ml with *water R*.

Apply to the plate 5 μ l of each solution. Develop over a path of 15 cm using the lower layer of a mixture of equal volumes of *concentrated ammonia R*, *methanol R* and *methylene chloride R*. Allow the plate to dry in air and spray with *ninhydrin solution R1*. Heat at 110 °C for 5 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution (a). The identification test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

TESTS

pH (2.2.3). Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 9.5 to 11.5.

Specific optical rotation (2.2.7). Dissolve 0.50 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 97 to + 105, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29), as prescribed under Assay.

Inject 20 μ l of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 μ l of reference solution (c). The test is not valid unless, in the chromatogram obtained, the resolution between the peaks corresponding to amikacin and impurity A is at least 3.5 (see Figure 1289-1). Inject 20 μ l of test solution (a). Continue the chromatography for four times the retention time of amikacin. In the chromatogram obtained with test solution (a): the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent); the area of any peak, apart from the principal peak and any peak corresponding to impurity A, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of any such peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Disregard any peak due to the blank and any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (a).

Water (2.5.12). Not more than 8.5 per cent, determined on 0.200 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.5 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent. In a round-glass-stoppered vial, add 0.2 ml of this solution to 2.0 ml of a 10 g/l solution of *2,4,6-trinitrobenzene sulphonic acid R*. Then add 3.0 ml of *pyridine R* and close the vial tightly. Shake vigorously for 30 s and heat in a water-bath at 75 °C for 45 min. Cool in cold water for 2 min and add 2 ml of *glacial acetic acid R*. Shake vigorously for 30 s.

Test solution (b). Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent. Then prepare as prescribed for test solution (a).

Reference solution (a). Dissolve 10.0 mg of *amikacin impurity A CRS* in *water R* and dilute to 100.0 ml with the same solvent. Then prepare as prescribed for test solution (a).

Reference solution (b). Dissolve 50.0 mg of *amikacin CRS* in *water R* and dilute to 50.0 ml with the same solvent. Then prepare as prescribed for test solution (a).

Reference solution (c). Dissolve 5 mg of *amikacin CRS* and 5 mg of *amikacin impurity A CRS* in *water R* and dilute to 50 ml with the same solvent. Then prepare as prescribed for test solution (a).

Blank solution. Prepare as described for test solution (a) using 0.2 ml of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 30 volumes of a 2.7 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 6.5 with a 22 g/l solution of *potassium hydroxide R* and 70 volumes of *methanol R*,
- as detector a spectrophotometer set at 340 nm, maintaining the temperature of the column at 30 °C and that of the solutions to be examined at 10 °C.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) six times. The assay is not valid unless the relative standard deviation of the peak area for amikacin is 2.0 per cent. Inject test solution (b) and reference solution (b).

IMPURITIES

- A. R1 = R3 = H, R2 = acyl: 4-*O*-(3-amino-3-deoxy- α -D-glucopyranosyl)-6-*O*-(6-amino-6-deoxy- α -D-glucopyranosyl)-1-*N*-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-L-streptamine,
- B. R1 = R2 = acyl, R3 = H: 4-*O*-(3-amino-3-deoxy- α -D-glucopyranosyl)-6-*O*-(6-amino-6-deoxy- α -D-glucopyranosyl)-1,3-*N*-bis[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-L-streptamine,
- C. R1 = R2 = H, R3 = acyl: 4-*O*-(6-amino-6-deoxy- α -D-glucopyranosyl)-6-*O*-[3-[[[(2*S*)-4-amino-2-hydroxybutanoyl]amino]-3-deoxy- α -D-glucopyranosyl]-2-deoxy-D-streptamine,
- D. R1 = R2 = R3 = H: kanamycin.

AMIKACIN SULPHATE

Amikacini sulfas

 $C_{22}H_{47}N_5O_{21}S_2$ M_r 782

DEFINITION

Amikacin sulphate is 6-*O*-(3-amino-3-deoxy- α -D-glucopyranosyl)-4-*O*-(6-amino-6-deoxy- α -D-glucopyranosyl)-1-*N*-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-D-streptamine sulphate, an antimicrobial substance obtained from kanamycin A. It contains not less than 72.3 per cent and not more than the equivalent of 76.8 per cent of $C_{22}H_{43}N_5O_{13}$, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, freely soluble in water, practically insoluble in acetone and in alcohol.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *amikacin sulphate CRS*.
- Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *amikacin sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *kanamycin monosulphate CRS* in 1 ml of the test solution and dilute to 10 ml with *water R*.

Apply to the plate 5 μ l of each solution. Develop over a path of 15 cm using the lower layer of a mixture of equal volumes of *concentrated ammonia R*, *methanol R* and *methylene chloride R*. Allow the plate to dry in air and spray with *ninhydrin solution RI*. Heat at 110 °C for 5 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution (a). The identification test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- It gives reaction (a) of sulphates (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 2.0 to 4.0.

Specific optical rotation (2.2.7). Dissolve 0.50 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 76 to + 84, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29), as prescribed under Assay.

Inject 20 μ l of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 μ l of reference solution (c). The test is not valid unless in the chromatogram obtained, the resolution between the peaks corresponding to amikacin and impurity A is at least 3.5 (see Figure 1290.-1). Inject 20 μ l of test solution (a). Continue the chromatography for four times the retention time of amikacin. In the chromatogram obtained with test solution (a): the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent); the area of any peak, apart from the principal peak and any peak corresponding to impurity A, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of any such peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Disregard any peak due to the blank, any peak eluting before the principal peak and any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (a).

Sulphate: 23.3 per cent to 25.8 per cent of sulphate (SO_4), calculated with reference to the dried substance. Dissolve 0.250 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of 0.1 *M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with 0.1 *M sodium edetate* adding 50 ml of *alcohol R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears. 1 ml of 0.1 *M barium chloride* is equivalent to 9.606 mg of sulphate (SO_4).

Loss on drying (2.2.32). Not more than 13.0 per cent, determined on 0.500 g by drying in an oven at 100-105 °C at a pressure not exceeding 0.7 kPa for 3 h.

Pyrogens (2.6.8). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 5 ml of a solution containing 25 mg of the substance to be examined in *water for injections R*.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent. In a round-glass-stoppered vial, add 0.2 ml of this solution to 2.0 ml of a 10 g/l solution of 2,4,6-trinitrobenzene sulphonic acid *R*. Then add 3.0 ml of *pyridine R* and close the vial tightly. Shake vigorously for 30 s and heat on a water-bath at 75 °C for 2 h. Cool in cold water for 2 min and add 2 ml of *glacial acetic acid R*. Shake vigorously for 30 s.

Test solution (b). Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent. Then prepare as prescribed for test solution (a).

Reference solution (a). Dissolve 10.0 mg of *amikacin impurity A CRS* in *water R* and dilute to 100.0 ml with the same solvent. Then prepare as prescribed for test solution (a).

Figure 1290-1. – Chromatogram for the test for related substances of amikacin sulphate

Reference solution (b). Dissolve 50.0 mg of amikacin sulphate CRS in water R and dilute to 50.0 ml with the same solvent. Then prepare as prescribed for test solution (a).

Reference solution (c). Dissolve 5 mg of amikacin sulphate CRS and 5 mg of amikacin impurity A CRS in water R and dilute to 50 ml with the same solvent. Then prepare as prescribed for test solution (a).

Blank solution. Prepare as described for test solution (a) using 0.2 ml of water R.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with octadecylsilyl silica gel for chromatography R (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 30 volumes of a 2.7 g/l solution of potassium dihydrogen phosphate R adjusted to pH 6.5 with a 22 g/l solution of potassium hydroxide R and 70 volumes of methanol R,

– as detector a spectrophotometer set at 340 nm,

maintaining the temperature of the column at 30 °C and that of the solutions to be examined at 10 °C.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) six times. The assay is not valid unless the relative standard deviation of the peak area for amikacin is 2.0 per cent. Inject test solution (b) and reference solution (b).

STORAGE

If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is apyrogenic.

IMPURITIES

- A. R1 = R3 = H, R2 = acyl: 4-*O*-(3-amino-3-deoxy- α -D-glucopyranosyl)-6-*O*-(6-amino-6-deoxy- α -D-glucopyranosyl)-1-*N*-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-L-streptamine,
- B. R1 = R2 = acyl, R3 = H: 4-*O*-(3-amino-3-deoxy- α -D-glucopyranosyl)-6-*O*-(6-amino-6-deoxy- α -D-glucopyranosyl)-1,3-*N*-bis[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-L-streptamine,
- C. R1 = R2 = H, R3 = acyl: 4-*O*-(6-amino-6-deoxy- α -D-glucopyranosyl)-6-*O*-[3-[[[(2*S*)-4-amino-2-hydroxybutanoyl]amino]-3-deoxy- α -D-glucopyranosyl]-2-deoxy-D-streptamine,
- D. R1 = R2 = R3 = H: kanamycin.

AMILORIDE HYDROCHLORIDE

Amiloridi hydrochloridum

 $C_6H_9Cl_2N_7O \cdot 2H_2O$ M_r 302.1

DEFINITION

Amiloride hydrochloride contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 3,5-diamino-*N*-carbamimidoyl-6-chloropyrazine-2-carboxamide, calculated with reference to the anhydrous substance.

CHARACTERS

A pale-yellow to greenish-yellow powder, slightly soluble in water and in ethanol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *amiloride hydrochloride CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.
- Test solution.* Dissolve 40 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.
- Reference solution.* Dissolve 40 mg of *amiloride hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 μ l of each solution. Develop over a path of 12 cm using a freshly prepared mixture of 6 volumes of *dilute ammonia R1*, 6 volumes of *water R* and 88 volumes of *dioxan R*. Allow the plate to dry in air and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the principal spot in the chromatogram obtained with the reference solution.

- C. Dissolve about 10 mg in 10 ml of *water R*. Add 10 ml of a 200 g/l solution of *cetrimide R*, 0.25 ml of *dilute sodium hydroxide solution R* and 1 ml of *bromine water R*. A greenish-yellow colour is produced. Add 2 ml of *dilute hydrochloric acid R*. The solution becomes deep yellow and shows blue fluorescence in ultraviolet light at 365 nm.
- D. It gives reaction (b) of chlorides (2.3.1).

TESTS

Free acid. Dissolve 1.0 g in a mixture of 50 ml of *methanol R* and 50 ml of *water R* and titrate with 0.1 *M* sodium hydroxide, determining the end-point potentiometrically (2.2.20). Not more than 0.3 ml of 0.1 *M* sodium hydroxide is required to reach the end-point.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of 1 volume of *acetonitrile R* and 3 volumes of *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 1 volume of *acetonitrile R* and 3 volumes of *water R*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with a mixture of 1 volume of *acetonitrile R* and 3 volumes of *water R*.

Reference solution (c). Dissolve 20.0 mg of *amiloride impurity A CRS* in a mixture of 1 volume of *acetonitrile R* and 3 volumes of *water R* and dilute to 20.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 100.0 ml with a mixture of 1 volume of *acetonitrile R* and 3 volumes of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1 ml/min a mixture of 5 volumes of *tetramethylammonium hydroxide solution R*, 250 volumes of *acetonitrile R* and 745 volumes of *water R*; adjust to pH 7.0 using a mixture of 1 volume of *phosphoric acid R* and 9 volumes of *water R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 μ l of reference solution (c). Adjust the concentration of acetonitrile in the mobile phase so that the retention time of impurity A is 5 min to 6 min (an increase in the concentration of acetonitrile results in a shorter retention time). Inject 20 μ l of reference solution (a). Adjust the concentration of tetramethylammonium hydroxide and of phosphoric acid keeping the pH at 7.0 so that the retention time of amiloride is 9 min to 12 min (an increase in the concentration results in a shorter retention time for amiloride). Inject 20 μ l of reference solution (b). The test is not valid unless the signal-to-noise ratio for the peak due to amiloride is at least 5.0.

Inject 20 μ l of the test solution and 20 μ l of reference solution (c). Record the chromatograms for five times the retention time of amiloride. In the chromatogram obtained

with the test solution, the sum of the areas of the peaks, apart from the peak corresponding to amiloride, is not greater than the area of the peak corresponding to impurity A in the chromatogram obtained with reference solution (c) (0.5 per cent). Disregard any peak with an area less than 10 per cent of the area of the peak corresponding to impurity A in the chromatogram obtained with reference solution (c).

Water (2.5.12): 11.0 per cent to 13.0 per cent, determined on 0.200 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 5.0 ml of 0.01 M hydrochloric acid and 50 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the two points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 26.61 mg of C₇H₇Cl₂N₂O.

STORAGE

Store protected from light.

IMPURITIES

A. methyl 3,5-diamino-6-chloropyrazine-2-carboxylate.

01/2005:1687

4-AMINO BENZOIC ACID

Acidum 4-aminobenzoicum

C₇H₇NO₂

M_r 137.1

DEFINITION

4-Aminobenzoic acid.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or slightly yellow, crystalline powder.

Solubility: slightly soluble in water, freely soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Melting point (2.2.14): 186 °C to 189 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: 4-aminobenzoic acid CRS.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 20 mg of the substance to be examined in methanol R and dilute to 20 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of 4-aminobenzoic acid CRS in methanol R and dilute to 20 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of 4-nitrobenzoic acid R in 10 ml of reference solution (a).

Plate: suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm as the coating substance.

Mobile phase: glacial acetic acid R, hexane R, methylene chloride R (5:20:75 V/V/V).

Application: 1 µl.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₅ (2.2.2, Method II).

Dissolve 1.0 g in alcohol R and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. Dissolve 25.0 mg of 4-nitrobenzoic acid R and 25.0 mg of benzocaine R in methanol R and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

- size: $l = 0.12$ m, $\varnothing = 4.0$ mm,
- stationary phase: octylsilyl silica gel for chromatography R (5 µm).

Mobile phase: mix 20 volumes of a mixture of 70 volumes of acetonitrile R and 80 volumes of methanol R, and 80 volumes of a solution containing 1.5 g/l of potassium dihydrogen phosphate R and 2.5 g/l of sodium octanesulphonate R adjusted to pH 2.2 with phosphoric acid R.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 20 µl.

Run time: 11 times the retention time of 4-aminobenzoic acid.

Relative retention with reference to 4-aminobenzoic acid (retention time = about 3 min): impurity A = about 4; impurity B = about 9.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.2 per cent),
- **impurity B:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.2 per cent),
- **any other impurity:** not more than 0.5 times the area of the peak due to impurity A in the chromatogram obtained with the reference solution (0.1 per cent),
- **total:** not more than 2.5 times the area of the peak due to impurity A in the chromatogram obtained with the reference solution (0.5 per cent),

- *disregard limit*: 0.1 times the area of the peak due to impurity A in the chromatogram obtained with the reference solution (0.02 per cent).

Impurity C and impurity D. Gas chromatography (2.2.28).

Internal standard solution. Dissolve 20.0 mg of *lauric acid R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent.

Test solution. Dissolve 1.000 g of the substance to be examined in 10.0 ml of an 84 g/l solution of *sodium hydroxide R* and extract with 2 quantities, each of 10 ml, of *methylene chloride R*. Combine and wash with 5 ml of *water R*; filter through *anhydrous sodium sulphate R*. Wash the filter with *methylene chloride R*. Evaporate in a water-bath at 50–60 °C to obtain a volume of about 1–5 ml. Add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *methylene chloride R*.

Reference solution (a). Dissolve 20.0 mg of *aniline R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 20.0 mg of *p-toluidine R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dilute 0.50 ml of reference solution (a), 0.50 ml of reference solution (b) and 10.0 ml of the internal standard solution to 100.0 ml with *methylene chloride R*.

Column:

- *material*: fused silica,
- *size*: $l = 30$ m, $\varnothing = 0.32$ mm,
- *stationary phase*: poly[methyl(95)phenyl(5)] siloxane *R* (film thickness 0.5 µm).

Carrier gas: helium for chromatography *R*.

Flow rate: 1.0 ml/min.

Split ratio: 1:10.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 4	130
	4 - 6.5	130 → 180
	6.5 - 11.5	180
Injection port		280
Detector		300

Detection: flame ionisation.

Injection: 2 µl; inject the test solution and reference solution (c).

Retention time: internal standard = about 9.5 min.

Limits:

- *impurity C*: calculate the ratio (*R*) of the area of the peak due to impurity C to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (c); calculate the ratio of the area of the peak due to impurity C to the area of the peak due to the internal standard from the chromatogram obtained with the test solution: this ratio is not greater than *R* (10 ppm),
- *impurity D*: calculate the ratio (*R*) of the area of the peak due to impurity D to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (c); calculate the ratio of the area of the peak due to impurity D to the area of the peak due to the internal standard from the chromatogram obtained with the test solution: this ratio is not greater than *R* (10 ppm).

Iron (2.4.9): maximum 40 ppm.

Dissolve 0.250 g in 3 ml of *alcohol R* and dilute to 10.0 ml with *water R*.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 0.2 per cent, determined on 1.00 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g with heating in 50 ml of *carbon dioxide-free water R*. Titrate with 0.1 *M sodium hydroxide* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M sodium hydroxide* is equivalent to 13.71 mg of $C_6H_{13}NO_2$.

STORAGE

Protected from light.

IMPURITIES

- A. $R = CO_2H$, $R' = NO_2$: 4-nitrobenzoic acid,
 B. $R = CO-O-C_2H_5$, $R' = NH_2$: benzocaine,
 C. $R = H$, $R' = NH_2$: aniline,
 D. $R = CH_3$, $R' = NH_2$: 4-methylaniline (*p*-toluidine).

01/2005:0874

AMINOCAPROIC ACID

Acidum aminocaproicum

$C_6H_{13}NO_2$

M_r 131.2

DEFINITION

Aminocaproic acid contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 6-aminohexanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in alcohol.

It melts at about 205 °C with decomposition.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *aminocaproic acid CRS*. Examine the substances prepared as discs.
- B. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with the test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

- C. Dissolve 0.5 g in 4 ml of a mixture of equal volumes of *dilute hydrochloric acid R* and *water R*. Evaporate to dryness by heating on a water-bath. Dry the residue in a desiccator. Dissolve the residue in about 2 ml of boiling *ethanol R*. Allow to cool and maintain at 4 °C to 8 °C for 3 h. Filter under reduced pressure. The residue washed with about 10 ml of *acetone R* and dried at 60 °C for 30 min, melts (2.2.14) at 131 °C to 133 °C.
- D. Dissolve about 5 mg in 0.5 ml of *distilled water R*. Add 3 ml of *dimethylformamide R* and 2 ml of *ascorbic acid solution R*. Heat on a water-bath. An orange colour develops.

TESTS

Solution S. dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is colourless (2.2.2, *Method II*) and remains clear (2.2.1) on standing for 24 h.

pH (2.2.3). The pH of solution S is 7.5 to 8.0.

Absorbance (2.2.25).

- A. The absorbance of solution S at 287 nm is not more than 0.10 and at 450 nm is not more than 0.03.
- B. Place 2.0 g in an even layer in a shallow dish 9 cm in diameter, cover and allow to stand at 98 °C to 102 °C for 72 h. Dissolve in *water R* and dilute to 10.0 ml with the same solvent. The absorbance of the solution at 287 nm is not more than 0.15 and at 450 nm is not more than 0.03.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *aminocaproic acid CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *aminocaproic acid CRS* and 10 mg of *leucine CRS* in *water R* and dilute to 25 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Dry the plate in a current of warm air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with the test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 20 ml of *anhydrous acetic acid R*. Using 0.1 ml of *crystal violet solution R* as indicator, titrate with 0.1 M *perchloric acid* until the colour changes from bluish-violet to bluish-green.

1 ml of 0.1 M *perchloric acid* is equivalent to 13.12 mg of C₆H₁₃N₂O₂.

01/2005:1291

AMINOGLUTETHIMIDE

Aminoglutethimidum

C₁₃H₁₆N₂O₂M_r 232.3

DEFINITION

Aminoglutethimide contains not less than 98.0 per cent and not more than the equivalent of 101.5 per cent of (3*RS*)-3-(4-aminophenyl)-3-ethylpiperidine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellow, crystalline powder, practically insoluble in water, freely soluble in acetone, soluble in methanol.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Melting point (2.2.14). 150 °C to 154 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *aminoglutethimide CRS*. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 25 mg of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *aminoglutethimide CRS* in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *aminoglutethimide CRS* and 25 mg of *glutethimide CRS* in *acetone R* and dilute to 5 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 0.5 volumes of *glacial acetic acid R*, 15 volumes of *methanol R* and 85 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The identification is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

TESTS

Solution S. Dissolve 1.0 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, Method II).

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^{\circ}$.

3-Aminoglutethimide and other related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *acetate buffer solution pH 5.0 R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5.0 mg of *aminoglutethimide impurity A CRS* in a mixture of equal volumes of *methanol R* and *acetate buffer solution pH 5.0 R* and dilute to 25.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with a mixture of equal volumes of *methanol R* and *acetate buffer solution pH 5.0 R*.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *methanol R* and *acetate buffer solution pH 5.0 R*.

Reference solution (d). Dilute 1.0 ml of the test solution to 10.0 ml with reference solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 3.9 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (4 μ m),
- as mobile phase at a flow rate of 1.3 ml/min a mixture of 27 volumes of *methanol R* and 73 volumes of *acetate buffer solution pH 5.0 R*,
- as detector a spectrophotometer set at 240 nm,

maintaining the temperature of the column at 40 °C.

Inject 10 μ l of reference solution (d). When the chromatograms are recorded in the prescribed conditions, the retention times are: aminoglutethimide about 9 min and impurity A about 12 min. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (d) is at least 60 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained with reference solution (d), the resolution between the peaks corresponding to aminoglutethimide and impurity A is at least 2.0.

Inject 10 μ l of the test solution, 10 μ l of reference solution (b) and 10 μ l of reference solution (c). Continue the chromatography of the test solution for four times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak due to impurity A is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent); the sum of the areas of any peaks apart from the principal peak and the peak due to impurity A is not greater than the area of the principal peak in the

chromatogram obtained with reference solution (c) (1 per cent); the sum of the contents of all the impurities is not greater than 2.0 per cent. Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (c).

Azoglutethimide. Not more than 300 ppm, determined by liquid chromatography (2.2.29). *Carry out the test protected from light. Use shaking, not sonication or heat, to dissolve the reference substance and the substance to be examined.*

Test solution. Dissolve 0.100 g of the substance to be examined in *dimethyl sulphoxide R* and dilute to 100.0 ml with the same solvent.

Reference solution. Dissolve 3.0 mg of *aminoglutethimide impurity D CRS* in *dimethyl sulphoxide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *dimethyl sulphoxide R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow of 1.0 ml/min a mixture prepared as follows: dissolve 0.285 g of *sodium edetate R* in *water R*, add 7.5 ml of *dilute acetic acid R* and 50 ml of 0.1 M *potassium hydroxide* and dilute to 1000 ml with *water R*; adjust to pH 5.0 with *glacial acetic acid R*; mix 350 ml of this solution with 650 ml of *methanol R*,
- as detector a spectrophotometer set at 328 nm.

Inject 10 μ l of each solution. The test is not valid unless: in the chromatogram obtained with the test solution the number of theoretical plates calculated for the principal peak is at least 3300; the mass distribution ratio of the principal peak is 2.0 to 5.0 and the symmetry factor of the principal peak is less than 1.2. The area of the peak due to impurity D in the chromatogram obtained with the test solution is not greater than that of the principal peak in the chromatogram obtained with the reference solution.

Sulphates (2.4.13). Dilute 6 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (500 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in 15 ml of *acetone R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test B for heavy metals (10 ppm). Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 ml of *acetone R* and 5 ml of *water R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g in 50 ml of *anhydrous acetic acid R* and titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 23.23 mg of C₁₃H₁₆N₂O₂.

IMPURITIES

- A. R3 = NH₂, R4 = H: (3*RS*)-3-(3-aminophenyl)-3-ethylpiperidine-2,6-dione (3-aminoglutethimide),
 B. R3 = NO₂, R4 = H: (3*RS*)-3-ethyl-3-(3-nitrophenyl)piperidine-2,6-dione,
 C. R3 = H, R4 = NO₂: (3*RS*)-3-ethyl-3-(4-nitrophenyl)piperidine-2,6-dione,

- D. 3,3'-[diazenediylbis(4,1-phenylene)]bis(3-ethylpiperidine-2,6-dione) (azoglutethimide).

01/2005:0803

AMIODARONE HYDROCHLORIDE

Amiodaroni hydrochloridum

C₂₅H₃₀ClN₂O₃M_r 682

DEFINITION

(2-Butylbenzofuran-3-yl)[4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl]methanone hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, fine crystalline powder.

Solubility: very slightly soluble in water, freely soluble in methylene chloride, soluble in methanol, sparingly soluble in alcohol.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: amiodarone hydrochloride CRS.

- B. It gives reaction (b) of chlorides (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution GY₅ or BY₅ (2.2.2, Method II).

Dissolve 1.0 g in *methanol R* and dilute to 20 ml with the same solvent.

pH (2.2.3): 3.2 to 3.8.

Dissolve 1.0 g in *carbon dioxide-free water R*, heating at 80 °C, cool and dilute to 20 ml with the same solvent.

Impurity H. Thin-layer chromatography (2.2.27). Prepare the solutions immediately before use and keep protected from bright light.

Test solution. Dissolve 0.5 g of the substance to be examined in *methylene chloride R* and dilute to 5.0 ml with the same solvent.

Reference solution. Dissolve 10 mg of (2-chloroethyl)diethylamine hydrochloride *R* in *methylene chloride R* and dilute to 50.0 ml with the same solvent.

Plate: TLC silica gel F₂₅₄ plate *R*.

Mobile phase: anhydrous formic acid *R*, methanol *R*, methylene chloride *R* (5:10:85 V/V/V).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in a current of cold air until the odour of solvents is no longer perceptible.

Detection: spray with *potassium iodobismuthate solution R1* and then with *dilute hydrogen peroxide solution R*. Examine immediately in daylight.

Limit:

- *impurity H*: any spot corresponding to impurity H is not more intense than the spot in the chromatogram obtained with the reference solution (0.2 per cent).

Related substances. Liquid chromatography (2.2.29).

Buffer solution pH 4.9. To 800 ml of *water R*, add 3.0 ml of *glacial acetic acid R*, adjust to pH 4.9 with *dilute ammonia R1* and dilute to 1000 ml with *water R*.

Test solution. Dissolve 0.125 g of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 25.0 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *amiodarone impurity D CRS*, 10 mg of *amiodarone impurity E CRS* and 10.0 mg of *amiodarone hydrochloride CRS* in *methanol R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 20.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*.

Column:

- *size*: *l* = 0.15 m, Ø = 4.6 mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography *R* (5 µm),
- *temperature*: 30 °C.

Mobile phase: buffer solution pH 4.9, *methanol R*, *acetonitrile R* (30:30:40 V/V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 10 µl.

Run time: twice the retention time of amiodarone.

Relative retention with reference to amiodarone (retention time = about 24 min): *impurity A* = about 0.26; *impurity D* = about 0.29; *impurity E* = about 0.37; *impurity B* = about 0.49; *impurity C* = about 0.55; *impurity G* = about 0.62; *impurity F* = about 0.69.

System suitability: reference solution:

- *resolution*: minimum 3.5 between the peaks due to *impurity D* and *impurity E*.

Limits:

- *any impurity*: not more than the area of the peak due to amiodarone in the chromatogram obtained with the reference solution (0.2 per cent),
- *total*: not more than 2.5 times the area of the peak due to amiodarone in the chromatogram obtained with the reference solution (0.5 per cent),

- *disregard limit*: 0.1 times the area of the peak due to amiodarone in the chromatogram obtained with the reference solution (0.02 per cent).

Iodides: maximum 150 ppm.

Prepare the test and reference solutions simultaneously.

Solution A. Add 1.50 g of the substance to be examined to 40 ml of *water R* at 80 °C and shake until completely dissolved. Cool and dilute to 50.0 ml with *water R*.

Test solution. To 15.0 ml of solution A add 1.0 ml of 0.1 M hydrochloric acid and 1.0 ml of 0.05 M potassium iodate. Dilute to 20.0 ml with *water R*. Allow to stand protected from light for 4 h.

Reference solution. To 15.0 ml of solution A add 1.0 ml of 0.1 M hydrochloric acid, 1.0 ml of a 88.2 mg/l solution of potassium iodide *R* and 1.0 ml of 0.05 M potassium iodate. Dilute to 20.0 ml with *water R*. Allow to stand protected from light for 4 h.

Measure the absorbances (2.2.25) of the solutions at 420 nm, using as the compensation liquid a mixture of 15.0 ml of solution A and 1.0 ml of 0.1 M hydrochloric acid diluted to 20.0 ml with *water R*. The absorbance of the test solution is not greater than half the absorbance of the reference solution.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying at 50 °C at a pressure not exceeding 0.3 kPa for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.600 g in a mixture of 5.0 ml of 0.01 M hydrochloric acid and 75 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 68.18 mg of $C_{25}H_{30}ClN_3O_4S$.

STORAGE

Protected from light, at a temperature not exceeding 30 °C.

IMPURITIES

- A. R1 = R2 = R4 = H, R3 = C₂H₅: (2-butylbenzofuran-3-yl)[4-[2-(diethylamino)ethoxy]phenyl]methanone,
- B. R1 = R2 = I, R3 = R4 = H: (2-butylbenzofuran-3-yl)[4-[2-(ethylamino)ethoxy]-3,5-diiodophenyl]methanone,
- C. R1 = I, R2 = R4 = H, R3 = C₂H₅: (2-butylbenzofuran-3-yl)[4-[2-(diethylamino)ethoxy]-3-iodophenyl]methanone,
- G. R1 = R2 = I, R3 = C₂H₅, R4 = OCH₃: [2-[(1*RS*)-1-methoxybutyl]benzofuran-3-yl][4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl]methanone,

- D. R1 = R2 = I: (2-butylbenzofuran-3-yl)(4-hydroxy-3,5-diiodophenyl)methanone,
- E. R1 = R2 = H: (2-butylbenzofuran-3-yl)(4-hydroxyphenyl)methanone,
- F. R1 = I, R2 = H: (2-butylbenzofuran-3-yl)(4-hydroxy-3-iodophenyl)methanone,

- H. 2-chloro-*N,N*-diethylethanamine (2-chlorotriethylamine, (2-chloroethyl)diethylamine).

01/2005:1490

AMISULPRIDE

Amisulpridum

C₁₇H₂₇N₃O₄S

*M*_r 369.5

DEFINITION

4-Amino-*N*-[[[(2*RS*)-1-ethylpyrrolidin-2-yl]methyl]-5-(ethylsulphonyl)-2-methoxybenzamide.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in ethanol.

mp: about 126 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: amisulpride CRS.

TESTS

Appearance of solution. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Dissolve 1.0 g in 3 ml of a mixture of 1 volume of *acetic acid R* and 4 volumes of *water R* and dilute to 20 ml with *water R*.

Optical rotation (2.2.7): −0.10° to +0.10°.

Dissolve 5.0 g in *dimethylformamide R* and dilute to 50.0 ml with the same solvent.

Impurity A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.20 g in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *amisulpride impurity A CRS* in *methanol R* and dilute to 100 ml with the same solvent. Dilute 2 ml of the solution to 20 ml with *methanol R*.

Reference solution (b). Dilute 1 ml of the test solution to 10 ml with reference solution (a).

Plate: TLC silica gel G plate R.

Mobile phase: the upper layer obtained after shaking a mixture of a 50 per cent V/V solution of *concentrated ammonia R*, *ethanol R* and *di-isopropyl ether R* (10:25:65 V/V/V).

Application: 10 µl.

Development: over a path of 12 cm.

Drying: in air.

Detection: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Limit:

- **impurity A:** any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g in 30 ml of *methanol R* and dilute to 100.0 ml with mobile phase B.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B. Dilute 1.0 ml of the solution to 25.0 ml with a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B.

Reference solution (b). Dissolve 5 mg of *amisulpride impurity B CRS* in 5 ml of the test solution and dilute to 50 ml with a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B. Dilute 1 ml of the solution to 10 ml with a mixture of 30 volumes of mobile phase A and 70 volumes of mobile phase B.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *octylsilyl silica gel for chromatography R* (5 µm) with a carbon loading of 16 per cent, a specific surface area of 330 m²/g and a pore size of 7.5 nm.

Mobile phase:

- **mobile phase A:** *methanol R*,
- **mobile phase B:** a 0.7 g/l solution of *sodium octanesulphonate R* in a 0.25 per cent V/V solution of *dilute sulphuric acid R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 18	30 → 36	70 → 64
18 - 35	36 → 52	64 → 48
35 - 45	52	48
45 - 46	52 → 30	48 → 70
46 - 56	30	70

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 225 nm.

Injection: 10 µl.

System suitability: reference solution (b):

- **resolution:** minimum 2.0 between the peaks due to amisulpride and impurity B.

Limits:

- **any impurity:** not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Chlorides (2.4.4): maximum 200 ppm.

Shake 0.5 g with 30 ml of *water R* for 10 min. Filter. 15 ml of the filtrate complies with the limit test for chlorides.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 4.0 g by gently heating in 5 ml of *dilute acetic acid R*. Allow to cool and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g with shaking in a mixture of 5 ml of *acetic anhydride R* and 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 36.95 mg of C₁₇H₂₇N₃O₄S.

IMPURITIES

A. [(2*RS*)-1-ethylpyrrolidin-2-yl]methanamine,

B. R1 = OH, R2 = SO₂-CH₂-CH₃: 4-amino-*N*-[[(2*RS*)-1-ethylpyrrolidin-2-yl]methyl]-5-(ethylsulphonyl)-2-hydroxybenzamide,

C. R1 = OCH₃, R2 = I: 4-amino-*N*-[[(2*RS*)-1-ethylpyrrolidin-2-yl]methyl]-5-iodo-2-methoxybenzamide,

D. R1 = OCH₃, R2 = SO₂-CH₃: 4-amino-*N*-[[(2*RS*)-1-ethylpyrrolidin-2-yl]methyl]-2-methoxy-5-(methylsulphonyl)benzamide,

E. 4-amino-5-(ethylsulphonyl)-2-methoxybenzoic acid.

01/2005:0464

AMITRIPTYLINE HYDROCHLORIDE

Amitriptylini hydrochloridum

 $C_{20}H_{24}ClN$ M_r 313.9

DEFINITION

Amitriptyline hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3-(10,11-dihydro-5*H*-dibenzo[*a,d*]annulen-5-ylidene)-*N*,*N*-dimethylpropan-1-amine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder or colourless crystals, freely soluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: C, E.

Second identification: A, B, D, E.

- A. Melting point (2.2.14): 195 °C to 199 °C.
- B. Dissolve 25.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 239 nm. The specific absorbance at the maximum is 435 to 475.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of amitriptyline hydrochloride*.
- D. Dissolve 0.1 g in 10 ml of *dilute sulphuric acid R*. Add 2 ml of a saturated solution of *potassium permanganate R*. The violet colour of the solution disappears quickly. Heat on a water-bath until the brown precipitate is almost completely dissolved. Cool, shake with 15 ml of *ether R* to remove the white turbidity and discard the ether layer. To the aqueous layer add 5 ml of *concentrated ammonia R* and shake for 2 min. Add 3 ml of *methylene chloride R* and shake again. A violet-red colour is produced in the lower layer.
- E. 50 mg gives reaction (b) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 1.25 g in *water R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. Add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 *M sodium hydroxide*. The solution is yellow. Add 0.4 ml of 0.01 *M hydrochloric acid*. The solution is red.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*. Prepare the solutions in subdued light and develop the chromatograms protected from light.

Test solution. Dissolve 0.20 g of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *dibenzosuberone CRS* in *alcohol R* and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 100 ml with *alcohol R*.

Reference solution (b). Dissolve 10 mg of *cyclobenzaprine hydrochloride CRS* in *alcohol R* and dilute to 10 ml with the same solvent. Dilute 2 ml of the solution to 50 ml with *alcohol R*.

Apply to the plate 5 µl of each solution. Develop in an unsaturated tank over a path of 14 cm using a mixture of 3 volumes of *diethylamine R*, 15 volumes of *ethyl acetate R* and 85 volumes of *cyclohexane R*. Heat the plate at 100-105 °C for 10 min and spray with a freshly prepared mixture of 4 volumes of *formaldehyde solution R* and 96 volumes of *sulphuric acid R*. Heat at 100-105 °C for 10 min and examine immediately in ultraviolet light at 365 nm and at 254 nm. In the chromatogram obtained with the test solution: any spots corresponding to dibenzosuberone and cyclobenzaprine hydrochloride are not more intense than the spots in the chromatograms obtained with reference solutions (a) (0.05 per cent) and (b) (0.2 per cent), respectively; any spot, apart from the principal spot and any spots corresponding to dibenzosuberone and cyclobenzaprine hydrochloride, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test F (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 30 ml of *alcohol R*. Titrate with 0.1 *M sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M sodium hydroxide* is equivalent to 31.39 mg of $C_{20}H_{24}ClN$.

STORAGE

Store protected from light.

IMPURITIES

- A. 10,11-dihydro-5*H*-dibenzo[*a,d*]annulen-5-one (dibenzosuberone),

01/2005:1491

B. 3-(5*H*-dibenzo[*a,d*][7]annulen-5-ylidene)-*N,N*-dimethylpropan-1-amine (cyclobenzaprine),

C. 3-(10,11-dihydro-5*H*-dibenzo[*a,d*][7]annulen-5-ylidene)-*N*-methylpropan-1-amine,

D. 5-[3-(dimethylamino)propyl]-10,11-dihydro-5*H*-dibenzo[*a,d*][7]annulen-5-ol,

E. 3-(1,2,3,4,4a,10,11,11a-octahydro-5*H*-dibenzo[*a,d*][7]annulen-5-ylidene)-*N,N*-dimethylpropan-1-amine,

F. (10*RS*)-5-[3-(dimethylamino)propylidene]-10,11-dihydro-5*H*-dibenzo[*a,d*][7]annulen-10-ol.

AMLODIPINE BESILATE

Amlodipini besilas

and enantiomer

$C_{26}H_{31}ClN_2O_8S$

M_r 567.1

DEFINITION

3-Ethyl 5-methyl (4*RS*)-2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate benzenesulphonate.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: slightly soluble in water, freely soluble in methanol, sparingly soluble in ethanol, slightly soluble in 2-propanol.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: amlodipine besilate CRS.

Preparation: mulls.

B. Examine the chromatograms obtained in test A for related substances in ultraviolet light at 366 nm.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (b).

C. Dissolve 5.0 mg in a 1 per cent *V/V* solution of 0.1 *M* hydrochloric acid in methanol *R* and dilute to 100.0 ml with the same acid solution. Examined between 300 nm and 400 nm (2.2.25), the solution shows an absorption maximum at 360 nm. The specific absorbance at the maximum is 113 to 121.

TESTS

Optical rotation (2.2.7): -0.10° to $+0.10^\circ$.

Dissolve 0.250 g in methanol *R* and dilute to 25.0 ml with the same solvent.

Related substances

A. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.140 g of the substance to be examined in methanol *R* and dilute to 2.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with methanol *R*.

Reference solution (a). Dissolve 70.0 mg of amlodipine besilate CRS in 1.0 ml of methanol *R*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with methanol *R*.

Reference solution (c). Dilute 3.0 ml of test solution (b) to 100.0 ml with *methanol R*.

Reference solution (d). Dilute 1.0 ml of test solution (b) to 100.0 ml with *methanol R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: the upper layer of a mixture of *glacial acetic acid R*, *water R* and *methyl isobutyl ketone R* (25:25:50 V/V/V).

Application: 10 μ l.

Development: over a path of 15 cm.

Drying: for 15 min at 80 °C.

Detection: examine in ultraviolet light at 254 nm and 366 nm.

System suitability: the chromatogram obtained with reference solution (a) shows 2 clearly separated minor spots with R_f values of about 0.18 and 0.22.

Limits: in the chromatogram obtained with test solution (a):

- **any impurity:** any spot, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.3 per cent) and at most 2 spots are more intense than the spot in the chromatogram obtained with reference solution (d) (0.1 per cent).

B. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 5.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *amlodipine besilate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 3.0 ml of test solution (a) to 100.0 ml with the mobile phase and dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of the substance to be examined in 5 ml of *strong hydrogen peroxide solution R*. Heat at 70 °C for 45 min.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 3.9$ mm,
- **stationary phase:** *octadecylsilyl silica gel for chromatography R* (5 μ m).

Mobile phase: mix 15 volumes of *acetonitrile R*, 35 volumes of *methanol R* and 50 volumes of a solution prepared as follows: dissolve 7.0 ml of *triethylamine R* in 1 litre of *water R* and adjust to pH 3.0 ± 0.1 with *phosphoric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 237 nm.

Injection: 10 μ l; inject test solution (a) and reference solutions (b) and (c).

Run time: 3 times the retention time of amlodipine.

Relative retention with reference to amlodipine (retention time = about 7 min): impurity D = about 0.5.

System suitability: reference solution (c):

- **resolution:** minimum 4.5 between the peaks corresponding to amlodipine and impurity D.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity D by 2,

- **impurity D:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **total of other impurities:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent); disregard any peak due to benzene sulphonate (relative retention = about 0.2),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

Water (2.5.12): maximum 0.5 per cent, determined on 3.000 g.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution (b), reference solution (a).

Calculate the percentage content of amlodipine besilate from the areas of the peaks and the declared content of $C_{26}H_{31}ClN_2O_8S$ in *amlodipine besilate CRS*.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. 3-ethyl 5-methyl (4RS)-4-(2-chlorophenyl)-2-[[2-(1,3-dioxo-1,3-dihydro-2H-isindol-2-yl)ethoxy]methyl]-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate,

B. 3-ethyl 5-methyl (4RS)-4-(2-chlorophenyl)-6-methyl-2-[[2-[(methylcarbamoyl)benzoyl]amino]ethoxy]methyl]-1,4-dihydropyridine-3,5-dicarboxylate,

C. ethyl methyl (4RS)-2,6-bis[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-1,4-dihydropyridine-3,5-dicarboxylate,

D. 3-ethyl 5-methyl 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate.

01/2005:0877

AMMONIA SOLUTION, CONCENTRATED

Ammoniae solutio concentrata

DEFINITION

Concentrated ammonia solution contains not less than 25.0 per cent *m/m* and not more than 30.0 per cent *m/m* of ammonia (NH_3 ; M_r 17.03).

CHARACTERS

A clear, colourless liquid, very caustic, miscible with water and with alcohol.

IDENTIFICATION

- Relative density (2.2.5): 0.892 to 0.910.
- It is strongly alkaline (2.2.4).
- To 0.5 ml add 5 ml of *water R*. Bubble air through the solution and lead the gaseous mixture obtained over the surface of a solution containing 1 ml of 0.1 *M hydrochloric acid* and 0.05 ml of *methyl red solution R*. The colour changes from red to yellow. Add 1 ml of *sodium cobaltinitrite solution R*. A yellow precipitate is formed.

TESTS

Solution S. Evaporate 220 ml almost to dryness on a water-bath. Cool, add 1 ml of *dilute acetic acid R* and dilute to 20 ml with *distilled water R*.

Appearance of solution. To 2 ml add 8 ml of *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Oxidisable substances. Cautiously add, whilst cooling, 8.8 ml to 100 ml of *dilute sulphuric acid R*. Add 0.75 ml of 0.002 *M potassium permanganate*. Allow to stand for 5 min. The solution remains faintly pink.

Pyridine and related substances. Measure the absorbance (2.2.25) at 252 nm using *water R* as the compensation liquid. The absorbance is not greater than 0.06 (2 ppm calculated as pyridine).

Carbonates. To 10 ml in a test-tube with a ground-glass neck add 10 ml of *calcium hydroxide solution R*. Stopper immediately and mix. Any opalescence in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 10 ml of a 0.1 g/l solution of *anhydrous sodium carbonate R* (60 ppm).

Chlorides (2.4.4). Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (1 ppm).

Sulphates (2.4.13). Dilute 3 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (5 ppm).

Iron (2.4.9). Dilute 4 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron (0.25 ppm).

Heavy metals (2.4.8). Dilute 4 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (1 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Residue on evaporation. Evaporate 50 ml to dryness on a water-bath and dry at 100 °C to 105 °C for 1 h. The residue weighs not more than 1 mg (0.02 g/l).

ASSAY

Weigh accurately a flask with a ground-glass neck containing 50.0 ml of 1 *M hydrochloric acid*. Add 2 ml of the substance to be examined and re-weigh. Add 0.1 ml of *methyl red solution R* as indicator. Titrate with 1 *M sodium hydroxide* until the colour changes from red to yellow.

1 ml of 1 *M hydrochloric acid* is equivalent to 17.03 mg of NH_3 .

STORAGE

Store protected from air, at a temperature not exceeding 20 °C.

01/2005:2081

AMMONIO METHACRYLATE COPOLYMER (TYPE A)

Ammonio methacrylatis copolymerum A

DEFINITION

Poly(ethyl propenoate-co-methyl 2-methylpropenoate-co-2-(trimethylammonio)ethyl 2-methylpropenoate) chloride having a mean relative molecular mass of about 150 000.

The ratio of ethyl propenoate groups to methyl 2-methylpropenoate groups to 2-(trimethylammonio)ethyl 2-methylpropenoate groups is about 1:2:0.2.

Content of ammonio methacrylate groups: 8.9 per cent to 12.3 per cent (dried substance).

CHARACTERS

Appearance: colourless to white or almost white granules or powder.

Solubility: practically insoluble in water, freely soluble in ethanol and in methylene chloride giving clear to cloudy solutions. Due to the polymeric nature of the substance, a stirring time of up to 5 h may be necessary.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: drop solution S (see Tests) on a disc of *potassium bromide R* and dry *in vacuo* at 70 °C for 2 h.

Comparison: *Ph. Eur. reference spectrum of ammonio methacrylate copolymer (type A)*.

B. It complies with the test for viscosity (see Tests).

C. It complies with the limits of the assay.

TESTS

Solution S. Dissolve a quantity of the substance to be examined corresponding to 12.5 g of the dried substance in a mixture of 35.0 g of *acetone R* and 52.5 g of *2-propanol R*.

Viscosity (2.2.10): maximum 15 mPa·s, determined on solution S.

Apparatus: rotating viscosimeter.

Dimensions:

- *spindle*: diameter = 25.15 mm; height = 90.74 mm; shaft diameter = 4.0 mm;
- *cylinder*: diameter = 27.62 mm; height = 0.135 m.

Stirring speed: 30 r/min.

Volume of solution: 16 ml of solution S.

Temperature: 20 °C.

Appearance of a film. Spread 2 ml of solution S evenly on a glass plate. Upon drying a clear film is formed.

Monomers. Liquid chromatography (2.2.29).

Solution A. Dissolve 3.5 g of *sodium perchlorate R* in *water for chromatography R* and dilute to 100 ml with the same solvent.

Test solution. Dissolve 5.00 g of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent. To 10.0 ml of this solution add 5.0 ml of solution A, dropwise while continuously stirring. Remove the precipitated polymer by centrifugation. Use the clear supernatant solution.

Reference solution. Dissolve 50.0 mg of *ethyl acrylate R* and 10.0 mg of *methyl methacrylate R* in *methanol R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Add 10 ml of this solution to 5 ml of solution A.

Column:

- *size*: $l = 0.12$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography R (7 µm).

Mobile phase: dilute *phosphoric acid R* with *water for chromatography R* to obtain a solution at pH 2.0; mix 800 ml of this solution and 200 ml of *methanol R*, filter and degas.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 202 nm.

Injection: 50 µl.

System suitability: reference solution:

- *resolution*: minimum 1.5 between the peaks due to impurity A and impurity B.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (100 ppm),
- *impurity B*: not more than 2.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (50 ppm).

Methanol (2.4.24, System A): maximum 1.5 per cent.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2.0 ml of *lead standard solution (10 ppm Pb R)*.

Loss on drying (2.2.32): maximum 3.0 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 5 h.

ASSAY

Dissolve 1.000 g in a mixture of 3 ml of *anhydrous formic acid R* and 30 ml of *anhydrous acetic acid R* and heat to dissolve. Add 20 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 20.77 mg of $C_9H_{18}O_2NCl$ (ammonio methacrylate groups).

IMPURITIES

Specified impurities: A, B.

A. R = H, R' = C_2H_5 : ethyl propenoate (ethyl acrylate),

B. R = R' = CH_3 : methyl 2-methylpropenoate (methyl methacrylate).

01/2005:2082

AMMONIO METHACRYLATE COPOLYMER (TYPE B)

Ammonio methacrylatis copolymerum B

DEFINITION

Poly(ethyl propenoate-co-methyl 2-methylpropenoate-co-2-(trimethylammonio)ethyl 2-methylpropenoate) chloride having a mean relative molecular mass of about 150 000.

The ratio of ethyl propenoate groups to methyl 2-methylpropenoate groups to 2-(trimethylammonio)ethyl 2-methylpropenoate groups is about 1:2:0.1.

Content of ammonio methacrylate groups: 4.5 per cent to 7.0 per cent (dried substance).

CHARACTERS

Appearance: colourless to white or almost white granules or powder.

Solubility: practically insoluble in water, freely soluble in ethanol and in methylene chloride giving clear to cloudy solutions. Due to the polymeric nature of the substance, a stirring time of up to 5 h may be necessary.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: drop solution S (see Tests) on a disc of *potassium bromide R* and dry *in vacuo* at 70 °C for 2 h.

Comparison: *Ph. Eur. reference spectrum of ammonio methacrylate copolymer (type B)*.

B. It complies with the test for viscosity (see Tests).

C. It complies with the limits of the assay.

TESTS

Solution S. Dissolve a quantity of the substance to be examined corresponding to 12.5 g of the dried substance in a mixture of 35.0 g of *acetone R* and 52.5 g of *2-propanol R*.

Viscosity (2.2.10): maximum 15 mPa·s, determined on solution S.

Apparatus: rotating viscosimeter.

Dimensions:

- *spindle*: diameter = 25.15 mm; height = 90.74 mm; shaft diameter = 4.0 mm;
- *cylinder*: diameter = 27.62 mm; height = 0.135 m.

Stirring speed: 30 r/min.

Volume of solution: 16 ml of solution S.

Temperature: 20 °C.

Appearance of a film. Spread 2 ml of solution S evenly on a glass plate. Upon drying a clear film is formed.

Monomers. Liquid chromatography (2.2.29).

Solution A. Dissolve 3.5 g of *sodium perchlorate R* in *water for chromatography R* and dilute to 100 ml with the same solvent.

Test solution. Dissolve 5.00 g of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent. To 10.0 ml of this solution add 5.0 ml of solution A, dropwise while continuously stirring. Remove the precipitated polymer by centrifugation. Use the clear supernatant solution.

Reference solution. Dissolve 50.0 mg of *ethyl acrylate R* and 10.0 mg of *methyl methacrylate R* in *methanol R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Add 10 ml of this solution to 5 ml of solution A.

Column:

- *size*: $l = 0.12$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography R (7 μ m).

Mobile phase: dilute *phosphoric acid R* with *water for chromatography R* to obtain a solution at pH 2.0; mix 800 ml of this solution and 200 ml of *methanol R*, filter and degas.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 202 nm.

Injection: 50 μ l.

System suitability: reference solution:

- *resolution*: minimum 1.5 between the peaks due to impurity A and impurity B.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (100 ppm),
- *impurity B*: not more than 2.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (50 ppm).

Methanol (2.4.24, System A): maximum 1.5 per cent.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2.0 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 3.0 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 5 h.

ASSAY

Dissolve 2.000 g in a mixture of 3 ml of *anhydrous formic acid R* and 30 ml of *anhydrous acetic acid R* and heat to dissolve. Add 20 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 20.77 mg of $\text{C}_9\text{H}_{18}\text{O}_2\text{NCl}$ (ammonio methacrylate groups).

IMPURITIES

Specified impurities: A, B.

A. R = H, R' = C_2H_5 : ethyl propenoate (ethyl acrylate),

B. R = R' = CH_3 : methyl 2-methylpropenoate (methyl methacrylate).

01/2005:1389

AMMONIUM BROMIDE

Ammonii bromidum

NH_4Br

M_r 97.9

DEFINITION

Content: 98.5 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals, hygroscopic.

Solubility: freely soluble in water, sparingly soluble in alcohol.

It becomes yellow when exposed to light or air.

IDENTIFICATION

A. It gives reaction (a) of bromides (2.3.1).

B. 10 ml of solution S (see Tests) gives the reaction of ammonium salts (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *methyl red solution R*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Bromates. To 10 ml of solution S add 1 ml of *starch solution R*, 0.1 ml of a 100 g/l solution of *potassium iodide R* and 0.25 ml of 0.5 M *sulphuric acid* and allow to stand protected from light for 5 min. No blue or violet colour develops.

Chlorides: maximum 0.6 per cent.

In a conical flask, dissolve 1.000 g in 20 ml of *dilute nitric acid R*. Add 5 ml of *strong hydrogen peroxide solution R* and heat on a water-bath until the solution is completely decolorised. Wash down the sides of the flask with a little *water R* and heat on a water-bath for 15 min. Allow to cool, dilute to 50 ml with *water R* and add 5.0 ml of 0.1 M *silver nitrate* and 1 ml of *dibutyl phthalate R*. Shake and titrate

with 0.1 M ammonium thiocyanate using 5 ml of ferric ammonium sulphate solution R2 as indicator. Not more than 1.7 ml of 0.1 M silver nitrate is used. Note the volume of 0.1 M silver nitrate used (see Assay). Carry out a blank test.

Iodides. To 5 ml of solution S add 0.15 ml of ferric chloride solution R1 and 2 ml of methylene chloride R. Shake and allow to separate. The lower layer is colourless (2.2.2, Method I).

Sulphates (2.4.13): maximum 100 ppm.

15 ml of solution S complies with the limit test for sulphates.

Iron (2.4.9): maximum 20 ppm.

5 ml of solution S diluted to 10 ml with water R complies with the limit test for iron.

Magnesium and alkaline-earth metals (2.4.7): maximum 200 ppm, calculated as Ca.

10.0 g complies with the limit test for magnesium and alkaline-earth metals. The volume of 0.01 M sodium edetate used does not exceed 5.0 ml.

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using lead standard solution (1 ppm Pb) R.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 1.500 g in water R and dilute to 100.0 ml with the same solvent. To 10.0 ml of the solution add 50 ml of water R, 5 ml of dilute nitric acid R, 25.0 ml of 0.1 M silver nitrate and 2 ml of dibutyl phthalate R. Shake. Titrate with 0.1 M ammonium thiocyanate using 2 ml of ferric ammonium sulphate solution R2 as indicator and shaking vigorously towards the end-point.

1 ml of 0.1 M silver nitrate is equivalent to 9.794 mg of NH₄Br.

Calculate the percentage content of NH₄Br from the expression:

$$a - 2.763 b$$

a = percentage content of NH₄Br and NH₄Cl obtained in the assay and calculated as NH₄Br,

b = percentage content of Cl obtained in the test for chlorides.

STORAGE

In an airtight container, protected from light.

DEFINITION

Ammonium chloride contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of NH₄Cl, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water.

IDENTIFICATION

A. It gives the reactions of chlorides (2.3.1).

B. 10 ml of solution S (see Tests) gives the reaction of ammonium salts (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in carbon dioxide-free water R prepared from distilled water R and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of methyl red solution R. Not more than 0.5 ml of 0.01 M hydrochloric acid or 0.01 M sodium hydroxide is required to change the colour of the indicator.

Bromides and iodides. To 10 ml of solution S add 0.1 ml of dilute hydrochloric acid R and 0.05 ml of chloramine solution R. After 1 min, add 2 ml of chloroform R and shake vigorously. The chloroform layer remains colourless (2.2.2, Method I).

Sulphates (2.4.13). 10 ml of solution S diluted to 15 ml with distilled water R complies with the limit test for sulphates (150 ppm).

Calcium (2.4.3). 5 ml of solution S diluted to 15 ml with distilled water R complies with the limit test for calcium (200 ppm).

Iron (2.4.9). 5 ml of solution S diluted to 10 ml with water R complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A (10 ppm). Prepare the standard using lead standard solution (1 ppm Pb) R.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g by drying in an oven at 100-105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 2.0 g.

01/2005:0007 ASSAY

Dissolve 1.000 g in 20 ml of water R and add a mixture of 5 ml of formaldehyde solution R, previously neutralised to phenolphthalein solution R, and 20 ml of water R. After 1 min to 2 min, titrate slowly with 1 M sodium hydroxide, using a further 0.2 ml of the same indicator.

1 ml of 1 M sodium hydroxide is equivalent to 53.49 mg of NH₄Cl.

AMMONIUM CHLORIDE

Ammonii chloridum

NH₄Cl

M_r 53.49

01/2005:1772 *Reference solution (a).* Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase.

AMMONIUM GLYCYRRHIZATE

Ammonii glycyrrhizas

$C_{42}H_{65}NO_{16}$

M_r 840

DEFINITION

Mixture of ammonium 18 α - and 18 β -glycyrrhizate (ammonium salt of (20 β)-3 β -[[2-*O*-(β -D-glucopyranosyluronic acid)- α -D-glucopyranosyluronic acid]oxy]-11-oxoolean-12-en-29-oic acid), the 18 β -isomer being the main component.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or yellowish-white, hygroscopic powder.

Solubility: slightly soluble in water, very slightly soluble in anhydrous ethanol, practically insoluble in acetone. It dissolves in dilute solutions of acids and of alkali hydroxides.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: ammonium glycyrrhizate CRS.

B. Dissolve 0.1 g in 20 ml of *water R*, add 2 ml of *dilute sodium hydroxide solution R* and heat cautiously. On heating, the solution gives off vapours that may be identified by the alkaline reaction of wet litmus paper (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method I*).

Dissolve 1.0 g in *ethanol (20 per cent V/V) R* and dilute to 100.0 ml with the same solvent.

Specific optical rotation (2.2.7): + 49.0 to + 54.0 (anhydrous substance).

Dissolve 0.5 g in *ethanol (50 per cent V/V) R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 50 mg of *ammonium glycyrrhizate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Column:

- *size:* $l = 0.25$ m, $\varnothing = 4.0$ mm,
- *stationary phase:* octadecylsilyl silica gel for chromatography R (5-10 μ m).

Mobile phase: glacial acetic acid R, acetonitrile R, water R (6:380:614 V/V/V).

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 μ l.

Run time: 3 times the retention time of 18 β -glycyrrhizic acid.

Relative retention with reference to 18 β -glycyrrhizic acid (retention time = about 8 min): impurity A = about 0.8; 18 α -glycyrrhizic acid = about 1.2.

System suitability: reference solution (b):

- *resolution:* minimum 2.0 between the peaks due to 18 β -glycyrrhizic acid and 18 α -glycyrrhizic acid.

Limits:

- *18 α -glycyrrhizic acid:* not more than twice the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (10.0 per cent),
- *impurity A:* not more than the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (5.0 per cent),
- *any other impurity:* for each impurity, not more than 0.4 times the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (2.0 per cent),
- *total of other impurities:* not more than 1.4 times the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (7.0 per cent),
- *disregard limit:* 0.04 times the sum of the areas of the peaks in the chromatogram obtained with reference solution (a) (0.2 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 6.0 per cent, determined on 0.250 g.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.600 g in 60 ml of *acetic acid R* heating at 80 °C if necessary. Cool. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 84.0 mg of $C_{42}H_{65}NO_{16}$.

STORAGE

In an airtight container.

IMPURITIES

- A. (4β,20β)-3β-[[2-O-(β-D-glucopyranosyluronic acid)-α-D-glucopyranosyluronic acid]oxy]-23-hydroxy-11-oxoolean-12-en-29-oic acid (24-hydroxyglycyrrhizinic acid).

01/2005:1390

AMMONIUM HYDROGEN CARBONATE

Ammonii hydrogenocarbonas

 NH_4HCO_3 M_r 79.1

DEFINITION

Ammonium hydrogen carbonate contains not less than 98.0 per cent and not more than 101.0 per cent of the equivalent of ammonium hydrogen carbonate.

CHARACTERS

A fine, white, crystalline powder or white crystals, slightly hygroscopic, freely soluble in water, practically insoluble in alcohol.

It volatilises rapidly at 60 °C. The volatilisation takes place slowly at ambient temperatures if the substance is slightly moist. It is in a state of equilibrium with ammonium carbamate.

IDENTIFICATION

- It gives the reaction of carbonates and bicarbonates (2.3.1).
- Dissolve 50 mg in 2 ml of *water R*. The solution gives the reaction of ammonium salts (2.3.1).

TESTS

Solution S. Dissolve 14.0 g in 100 ml of *distilled water R*. Boil to remove the ammonia, allow to cool and dilute to 100.0 ml with *distilled water R*.

Chlorides (2.4.4). Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (70 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (70 ppm).

Iron (2.4.9). Dilute 1.8 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron (40 ppm).

Heavy metals (2.4.8). Dissolve cautiously 2.5 g in 25 ml of 1 M *hydrochloric acid*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

ASSAY

Dissolve cautiously 1.0 g in 20.0 ml of 0.5 M *sulphuric acid* and dilute to 50 ml with *water R*. Boil, cool and titrate the excess of acid with 1 M *sodium hydroxide*, using 0.1 ml of *methyl red solution R* as indicator.

1 ml of 0.5 M *sulphuric acid* is equivalent to 79.1 mg of NH_4HCO_3 .

STORAGE

Store in an airtight container.

01/2005:0594

AMOBARBITAL

Amobarbitalum

 $\text{C}_{11}\text{H}_{18}\text{N}_2\text{O}_3$ M_r 226.3

DEFINITION

Amobarbital contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-ethyl-5-(3-methylbutyl)pyrimidin-2,4,6(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, very slightly soluble in water, freely soluble in alcohol, soluble in methylene chloride. It forms water-soluble compounds with alkali hydroxides and carbonates and with ammonia.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- Determine the melting point (2.2.14) of the substance to be examined. Mix equal parts of the substance to be examined and *amobarbital CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 157 °C) is not greater than 2 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *amobarbital CRS*.
- Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *amobarbital CRS* in *alcohol R* and dilute to 100 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer from a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 4 ml of *dilute sodium hydroxide solution R* and 6 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Acidity or alkalinity. To 1.0 g add 50 ml of *water R* and boil for 2 min. Allow to cool and filter. To 10 ml of the filtrate add 0.15 ml of *methyl red solution R* and 0.1 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Add 0.2 ml of 0.01 M *hydrochloric acid*. The solution is red.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *alcohol R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer from a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine the plate immediately in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution. Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with *aldehyde-free alcohol R*. Heat at 100 °C to 105 °C for 5 min and examine immediately. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 5 ml of *pyridine R*. Add 0.5 ml of *thymolphthalein solution R* and 10 ml of *silver nitrate solution in pyridine R*. Titrate with 0.1 M *ethanolic sodium hydroxide* until a pure blue colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 11.31 mg of C₁₁H₁₈N₂O₃.

01/2005:0166

AMOBARBITAL SODIUM

Amobarbitalum natricum

C₁₁H₁₇N₂NaO₃M_r 248.3

DEFINITION

Amobarbital sodium contains not less than 98.5 per cent and not more than the equivalent of 102.0 per cent of sodium derivative of 5-ethyl-5-(3-methylbutyl)pyrimidin-2,4,6(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white, granular powder, hygroscopic, very soluble in carbon dioxide-free water (a small fraction may be insoluble), freely soluble in alcohol.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. Acidify 10 ml of solution S (see Tests) with *dilute hydrochloric acid R* and shake with 20 ml of *ether R*. Separate the ether layer, wash with 10 ml of *water R*, dry over *anhydrous sodium sulphate R* and filter. Evaporate the filtrate to dryness and dry the residue at 100 °C to 105 °C (test residue). Repeat the operations using 0.1 g of *amobarbital sodium CRS* (reference residue). Determine the melting point (2.2.14) of the test residue. Mix equal parts of the test residue and the reference residue and determine the melting point of the mixture. The difference between the melting points (which are about 157 °C) is not greater than 2 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing the spectrum obtained with the reference residue prepared from *amobarbital sodium CRS* with that obtained with the test residue (see identification test A).

C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *amobarbital sodium CRS* in *alcohol R* and dilute to 100 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

E. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *alcohol (50 per cent V/V) R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

pH (2.2.3). Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent. Disregard any slight residue. The pH of the solution is not more than 11.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *alcohol R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine the plate immediately in ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with *aldehyde-free alcohol R*. Heat at 100 °C to 105 °C for 5 min and examine immediately. When examined in ultraviolet light and after spraying, any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Disregard any spot at the starting-point.

Loss on drying (2.2.32). Not more than 3.0 per cent, determined on 0.50 g by drying in an oven at 130 °C.

ASSAY

Dissolve 0.200 g in 5 ml of *ethanol R*. Add 0.5 ml of *thymolphthalein solution R* and 10 ml of *silver nitrate solution in pyridine R*. Titrate with 0.1 M *ethanolic sodium hydroxide* until a pure blue colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 24.83 mg of $C_{16}H_{18}N_3NaO_5S$.

STORAGE

Store in an airtight container.

01/2005:0577
corrected

AMOXICILLIN SODIUM

Amoxicillinum natricum

$C_{16}H_{18}N_3NaO_5S$

M_r 387.4

DEFINITION

Amoxicillin sodium contains not less than 89.0 per cent and not more than the equivalent of 102.0 per cent of sodium (2*S*,5*R*,6*R*)-6-[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, very hygroscopic, very soluble in water, sparingly soluble in ethanol, very slightly soluble in acetone.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Dissolve 0.250 g in 5 ml of *water R*, add 0.5 ml of *dilute acetic acid R*, swirl and allow to stand for 10 min in iced water. Filter the crystals and wash with 2 ml to 3 ml

of a mixture of 1 volume of *water R* and 9 volumes of *acetone R*, then dry in an oven at 60 °C for 30 min. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *amoxicillin trihydrate CRS*.

B. Examine by thin-layer chromatography (2.2.27), using a *TLC silanised silica gel plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (a). Dissolve 25 mg of *amoxicillin trihydrate CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (b). Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *ampicillin trihydrate CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R* and 90 volumes of a 154 g/l solution of *ammonium acetate R*, the pH of which has been adjusted to 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

D. It gives reaction (a) of sodium (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in *water R* and dilute to 10.0 ml with the same solvent. Immediately after dissolution, the solution is not more opalescent than reference suspension II (2.2.1). The solution may show an initial, but transient, pink colour. After 5 min, the absorbance measured at 430 nm (2.2.25) is not greater than 0.20.

pH (2.2.3). Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 8.0 to 10.0.

Specific optical rotation (2.2.7). Dissolve 62.5 mg in a 4 g/l solution of *potassium hydrogen phthalate R* and dilute to 25.0 ml with the same solution. The specific optical rotation is + 240 to + 290, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject 50 µl of reference solution (d) and elute isocratically until elution of the amoxicillin peak. Inject 50 µl of test solution (b) and start the elution isocratically. Immediately after elution of the amoxicillin peak start the following linear gradient. If the mobile phase composition has been adjusted to achieve the required resolution, the adjusted composition will apply at time zero in the gradient.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 25	92 → 0	8 → 100	linear gradient
25 - 40	0	100	isocratic
40 - 55	92	8	re-equilibration

Inject mobile phase A and use the same elution pattern to obtain a blank. Inject reference solution (e). The 3 principal peaks eluted after the main peak correspond to amoxicillin diketopiperazine, amoxicillin dimer (impurity J; $n = 1$) and amoxicillin trimer (impurity J; $n = 2$) and, compared to the principal peak they have a relative retention time of about 3.4, 4.1 and 4.5, respectively. In the chromatogram obtained with test solution (b): the area of any peak corresponding to amoxicillin dimer is not greater than 3 times the area of the principal peak in the chromatogram obtained with reference solution (d) (3 per cent); the area of any peak, apart from the principal peak and any peak corresponding to amoxicillin dimer, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (d) (2 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 9 times the area of the principal peak in the chromatogram obtained with reference solution (d) (9 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (d).

N,N-Dimethylaniline (2.4.26, *Method A or B*). Not more than 20 ppm.

2-Ethylhexanoic acid (2.4.28). Not more than 0.8 per cent *m/m*.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12). Not more than 3.0 per cent, determined on 0.400 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.25 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 30.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 ml with the same mobile phase.

Test solution (b). Prepare immediately before use. Dissolve 30.0 mg of the substance to be examined in mobile phase A and dilute to 20.0 ml with the same mobile phase.

Reference solution (a). Dissolve 30.0 mg of *amoxicillin trihydrate CRS* in mobile phase A and dilute to 50.0 ml with the same mobile phase.

Reference solution (b). Dissolve 4.0 mg of *cefadroxil CRS* in mobile phase A and dilute to 50 ml with the same mobile phase. To 5.0 ml of this solution add 5.0 ml of reference solution (a) and dilute to 100 ml with mobile phase A.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 50.0 ml with mobile phase A.

Reference solution (d). Dilute 2.0 ml of reference solution (a) to 20.0 ml with mobile phase A. Dilute 5.0 ml of the solution to 20.0 ml with mobile phase A.

Reference solution (e). To 0.20 g of *amoxicillin trihydrate R* add 1.0 ml of *water R*. Shake and add dropwise *dilute sodium hydroxide solution R* to obtain a solution. The pH of the solution is about 8.5. Store the solution at room temperature for 4 h. Dilute 0.5 ml of the solution to 50.0 ml with mobile phase A.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),

- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Mix 1 volume of *acetonitrile R* and 99 volumes of a 25 per cent V/V solution of 0.2 M *potassium dihydrogen phosphate R* adjusted to pH 5.0 with *dilute sodium hydroxide solution R*,

Mobile phase B. Mix 20 volumes of *acetonitrile R* and 80 volumes of a 25 per cent V/V solution of 0.2 M *potassium dihydrogen phosphate R* adjusted to pH 5.0 with *dilute sodium hydroxide solution R*,

- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with a mobile phase ratio A:B of 92:8. Inject 50 μ l of reference solution (b). The test is not valid unless in the chromatogram obtained, the resolution between the peaks corresponding to amoxicillin and cefadroxil is at least 2.0 (if necessary, adjust the ratio A:B of the mobile phase) and the mass distribution ratio for the first peak (amoxicillin) is 1.3 to 2.5. Inject reference solution (c). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation for the area of the principal peak is at most 1.0 per cent. Inject test solution (a) and reference solution (a).

Calculate the percentage content of amoxicillin sodium by multiplying the percentage content of amoxicillin by 1.060.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- B. (2*S*,5*R*,6*R*)-6-[(2*S*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (L-amoxicillin),

- C. (4*S*)-2-[5-(4-hydroxyphenyl)-3,6-dioxopiperazin-2-yl]-5,5-dimethylthiazolidine-4-carboxylic acid (amoxicillin diketopiperazines),

AMOXICILLIN TRIHYDRATE

Amoxicillinum trihydricum

 $C_{16}H_{19}N_3O_5S \cdot 3H_2O$
 M_r 419.4

DEFINITION

Amoxicillin trihydrate contains not less than 95.0 per cent and not more than the equivalent of 102.0 per cent of (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-[[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, very slightly soluble in alcohol, practically insoluble in fatty oils. It dissolves in dilute acids and dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *amoxicillin trihydrate CRS*.

B. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (a). Dissolve 25 mg of *amoxicillin trihydrate CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (b). Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *ampicillin trihydrate CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R* and 90 volumes of a 154 g/l solution of *ammonium acetate R*, the pH of which has been adjusted to 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

TESTS

Solution S. With the aid of ultrasound or gentle heating, dissolve 0.100 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Dissolve 1.0 g in 10 ml of 0.5 M *hydrochloric acid*. Dissolve separately 1.0 g in 10 ml of *dilute ammonia R2*. Immediately after dissolution, the solutions are not more opalescent than reference suspension II (2.2.1).

pH (2.2.3). The pH of solution S is 3.5 to 5.5.

Specific optical rotation (2.2.7): + 290 to + 315, determined on solution S and calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) adjusting the ratio A:B of the mobile phase and the attenuation as described under Assay. Inject reference solution (d). Inject a freshly prepared test solution (b) and start the elution isocratically with the chosen mobile phase. Immediately after elution of the amoxicillin peak start a linear gradient elution to reach a mobile phase A:B of 0:100 over a period of 25 min. Continue the chromatography with mobile phase B for 15 min, then equilibrate the column for 15 min with the mobile phase chosen originally. Inject mobile phase A and use the same elution gradient to obtain a blank. In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak and any peak observed in the blank chromatogram, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (1 per cent).

***N,N*-Dimethylaniline (2.4.26, Method A or B).** Not more than 20 ppm.

Water (2.5.12): 11.5 per cent to 14.5 per cent, determined on 0.100 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 1.0 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 30.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 ml with the same mobile phase.

Test solution (b). Dissolve 30.0 mg of the substance to be examined in mobile phase A and dilute to 20.0 ml with the same mobile phase.

Reference solution (a). Dissolve 30.0 mg of *amoxicillin trihydrate CRS* in mobile phase A and dilute to 50.0 ml with the same mobile phase.

Reference solution (b). Dissolve 4.0 mg of *cefadroxil CRS* in mobile phase A and dilute to 50 ml with the same mobile phase. To 5.0 ml of this solution add 5.0 ml of reference solution (a) and dilute to 100 ml with mobile phase A.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 50.0 ml with mobile phase A.

Reference solution (d). Dilute 2.0 ml of reference solution (a) to 20.0 ml with mobile phase A. Dilute 5.0 ml of this solution to 20.0 ml with mobile phase A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. A mixture of 1 volume of *acetonitrile R* and 99 volumes of buffer solution pH 5.0,

Mobile phase B. A mixture of 20 volumes of *acetonitrile R* and 80 volumes of buffer solution pH 5.0,

Prepare the buffer solution as follows: to 250 ml of 0.2 M *potassium dihydrogen phosphate R* add *dilute sodium hydroxide solution R* to pH 5.0 and dilute to 1000.0 ml with *water R*,

- as detector a spectrophotometer set at 254 nm,
- a 50 µl loop injector.

Equilibrate the column with a mobile phase with ratio A:B of 92:8. Inject reference solution (b). The assay is not valid unless the resolution between the 2 principal peaks is at least 2.0. If necessary, adjust the ratio A:B of the mobile phase. The mass distribution ratio for the first peak (amoxicillin) is 1.3 to 2.5. Inject reference solution (c). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation for the area of the principal peak is at most 1.0 per cent. Inject alternately test solution (a) and reference solution (a).

STORAGE

Store in an airtight container.

IMPURITIES

- A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- B. (2*S*,5*R*,6*R*)-6-[[[(2*S*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (L-amoxicillin),

- H. (2*R*)-2-[(2,2-dimethylpropanoyl)amino]-2-(4-hydroxyphenyl)acetic acid,

- E. R = H: (2*RS*,4*S*)-2-[[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of amoxicillin),

- F. 3-(4-hydroxyphenyl)pyrazin-2-ol,

- G. (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-[[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]-2-(4-hydroxyphenyl)acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (D-(4-hydroxyphenyl)glycylamoxicillin),

- K. oligomers of penicilloic acids of amoxicillin,

- L. (2*S*,5*R*,6*R*)-6-[[[(2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-APA amoxicillin amide).

01/2005:1292

AMPHOTERICIN B

Amphotericinum B

DEFINITION

Amphotericin B is a mixture of antifungal polyenes produced by the growth of certain strains of *Streptomyces nodosus* or by any other means. It consists mainly of amphotericin B which is (1*R*,3*S*,5*R*,6*R*,9*R*,11*R*,15*S*,16*R*,17*R*,18*S*,19*E*,21*E*,23*E*, 25*E*, 27*E*,29*E*,31*E*,33*R*,35*S*,36*R*,37*S*)-33-[(3-amino-3,6-dideoxy-β-D-mannopyranosyl)oxy]-1,3,5,6,9,11,17,37-octahydroxy-15,16,18-trimethyl-13-oxo-14,39-dioxabicyclo[33.3.1]nonatriaconta-19,21,23,25,27,29,31-heptaene-36-carboxylic acid. The potency is not less than 750 IU/mg, calculated with reference to the dried substance.

CHARACTERS

A yellow or orange powder, practically insoluble in water, soluble in dimethyl sulphoxide and in propylene glycol, slightly soluble in dimethylformamide, very slightly soluble in methanol, practically insoluble in alcohol.

It is sensitive to light in dilute solutions and is inactivated at low pH values.

IDENTIFICATION

- A. Dissolve 25 mg in 5 ml of *dimethyl sulphoxide R* and dilute to 50 ml with *methanol R*. Dilute 2 ml of the solution to 200 ml with *methanol R*. Examined between 300 nm and 450 nm (2.2.25), the solution shows 3 absorption maxima at 362 nm, 381 nm and 405 nm. The ratio of the absorbance measured at 362 nm to that measured at 381 nm is 0.57 to 0.61. The ratio of the absorbance measured at 381 nm to that measured at 405 nm is 0.87 to 0.93.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *amphotericin B CRS*. If the spectra obtained show differences dry the substance to be examined at 60 °C at a pressure not exceeding 0.7 kPa for 1 h and prepare a new spectrum.
- C. To 1 ml of a 0.5 g/l solution in *dimethyl sulphoxide R*, add 5 ml of *phosphoric acid R* to form a lower layer, avoiding mixing the 2 liquids. A blue ring is immediately

produced at the junction of the liquids. Mix, an intense blue colour is produced. Add 15 ml of *water R* and mix; the solution becomes pale yellow.

TESTS

Content of tetraenes. Not more than 10.0 per cent and not more than 5.0 per cent if intended for use in the manufacture of parenteral dosage forms, determined by the following method.

Test solution. Dissolve 50.0 mg in 5 ml of *dimethyl sulphoxide R* and dilute to 50.0 ml with *methanol R*. Dilute 4.0 ml of the solution to 50.0 ml with *methanol R*.

Reference solution (a). Dissolve 50.0 mg of *amphotericin B CRS* in 5 ml of *dimethyl sulphoxide R* and dilute to 50.0 ml with *methanol R*. Dilute 4.0 ml of the solution to 50.0 ml with *methanol R*.

Reference solution (b). Dissolve 25.0 mg of *nystatin CRS* in 25 ml of *dimethyl sulphoxide R* and dilute to 250.0 ml with *methanol R*. Dilute 4.0 ml of the solution to 50.0 ml with *methanol R*.

Measure the absorbances (2.2.25) of the test solution and of reference solutions (a) and (b) at the maxima at 282 nm and 304 nm respectively, using a 0.8 per cent V/V solution of *dimethyl sulphoxide R* in *methanol R* as the compensation liquid. Calculate the specific absorbance of the substance being examined, of *nystatin CRS* and of *amphotericin B CRS* at both wavelengths, each with reference to the dried substance, and calculate the percentage content of tetraenes using the following expression:

$$F + \frac{100 (B_1 S_2 - B_2 S_1)}{(N_2 B_1 - N_1 B_2)}$$

S_1 and S_2 = specific absorbances of the substance to be examined at 282 nm and 304 nm respectively,

N_1 and N_2 = specific absorbance of *nystatin CRS* at 282 nm and 304 nm respectively,

B_1 and B_2 = specific absorbance of *amphotericin B CRS* at 282 nm and 304 nm respectively,

F = declared content of tetraenes in *amphotericin B CRS*.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa.

Sulphated ash (2.4.14). Not more than 3.0 per cent and not more than 0.5 per cent if intended for use in the manufacture of parenteral dosage forms, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 1.0 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Protect all solutions from light throughout the assay. Dissolve 25.0 mg in *dimethyl sulphoxide R* and dilute, with shaking, to 25.0 ml with the same solvent. Under constant stirring of this stock solution, dilute with *dimethyl sulphoxide R* to obtain solutions of appropriate concentrations (the following concentrations have been found suitable: 44.4, 66.7 and 100 IU/ml). Final solutions are prepared by diluting 1 to 20 with 0.2 M phosphate buffer solution pH 10.5 so that they all contain 5 per cent V/V of dimethyl sulphoxide. Prepare the reference and the test solutions simultaneously. Carry out the microbiological assay of antibiotics (2.7.2).

STORAGE

Store protected from light, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- where applicable, that the substance is free from bacterial endotoxins,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. amphotericin A (tetraene).

01/2005:0167

AMPICILLIN, ANHYDROUS

Ampicillinum anhydricum

$C_{16}H_{19}N_3O_4S$

M_r 349.4

DEFINITION

Anhydrous ampicillin contains not less than 96.0 per cent and not more than the equivalent of 100.5 per cent of (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, sparingly soluble in water, practically insoluble in acetone, in alcohol and in fatty oils. It dissolves in dilute solutions of acids and of alkali hydroxides. It shows polymorphism.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *anhydrous ampicillin CRS*. Examine the substances prepared as discs using *potassium bromide R*.
- Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (a). Dissolve 25 mg of *anhydrous ampicillin CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (b). Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *anhydrous ampicillin CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Apply separately to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R* and 90 volumes of a 154 g/l solution of *ammonium acetate R*, the pH of which has been adjusted to 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

- Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

- It complies with the test for water (see Tests).

TESTS

Appearance of solution. Dissolve 1.0 g in 10 ml of 1 *M hydrochloric acid*. Separately dissolve 1.0 g in 10 ml of *dilute ammonia R2*. Immediately after dissolution, the solutions are not more opalescent than reference suspension II (2.2.1).

pH (2.2.3). Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 40 ml with the same solvent. The pH of the solution is 3.5 to 5.5.

Specific optical rotation (2.2.7). Dissolve 62.5 mg in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 280 to + 305, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject reference solution (c) and elute isocratically. Inject freshly prepared test solution (b) and start the elution isocratically. Immediately after elution of the ampicillin peak start the following linear gradient. If the mobile phase composition has been adjusted to achieve the required resolution, the adjusted composition will apply at time zero in the gradient.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0	85	15
30	0	100
45	0	100

Equilibrate the column with the originally chosen mobile phase for 15 min. Inject mobile phase A and use the same elution gradient to obtain a blank. In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak and any peak observed in the blank chromatogram, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

***N,N*-Dimethylaniline** (2.4.26, *Method B*). Not more than 20 ppm.

Water (2.5.12). Not more than 2.0 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.5 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 27.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 ml with the same solvent.

Test solution (b). Dissolve 27.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 27.0 mg of *anhydrous ampicillin CRS* in mobile phase A and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dissolve 2.0 mg of *cefradine CRS* in mobile phase A and dilute to 50 ml with the same solvent. To 5.0 ml of this solution add 5.0 ml of reference solution (a).

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A.

Reference solution (d). Dilute 1.0 ml of reference solution (c) to 25.0 ml with mobile phase A.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. A mixture of 0.5 ml of *dilute acetic acid R*, 50 ml of *0.2 M potassium dihydrogen phosphate R* and 50 ml of *acetonitrile R*, diluted to 1000 ml with *water R*,

Mobile phase B. A mixture of 0.5 ml of *dilute acetic acid R*, 50 ml of *0.2 M potassium dihydrogen phosphate R* and 400 ml of *acetonitrile R*, diluted to 1000 ml with *water R*,

- as detector a spectrophotometer set at 254 nm,
- a 50 µl loop injector.

Equilibrate the column with a mobile phase with ratio A:B of 85:15. Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is at least 3.0. If necessary, adjust the ratio A:B of the mobile phase. The mass distribution ratio for the first peak (ampicillin) is 2.0 to 2.5. Inject reference solution (d). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation for the area of the principal peak is at most 1.0 per cent. Inject alternately test solution (a) and reference solution (a).

Calculate the percentage content of ampicillin.

STORAGE

Store in an airtight container, at a temperature not exceeding 30 °C.

IMPURITIES

- A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- B. (2*S*,5*R*,6*R*)-6-[(2*S*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (L-ampicillin),

 $C_{16}H_{18}N_3NaO_4S$ M_r 371.4**DEFINITION**

Ampicillin sodium contains not less than 91.0 per cent and not more than the equivalent of 100.5 per cent of sodium (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, hygroscopic, freely soluble in water, sparingly soluble in acetone, practically insoluble in fatty oils and in liquid paraffin.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Dissolve 0.250 g in 5 ml of *water R*, add 0.5 ml of *dilute acetic acid R*, swirl and allow to stand for 10 min in iced water. Filter the crystals through a small sintered-glass filter (40), applying suction, wash with 2 ml to 3 ml of a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dry in an oven at 60 °C for 30 min. Examine the crystals by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ampicillin trihydrate CRS*.

- B. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (a). Dissolve 25 mg of *ampicillin trihydrate CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (b). Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *ampicillin trihydrate CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Apply separately to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R* and 90 volumes of a 154 g/l solution of *ammonium acetate R*, the pH of which has been adjusted to 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*.

Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

D. It gives reaction (a) of sodium (2.3.1).

TESTS

Appearance of solution. Place 1.0 g in a conical flask and add slowly and with continuous swirling 10 ml of 1 M hydrochloric acid. Separately dissolve 1.0 g in water R and dilute to 10.0 ml with the same solvent. Immediately after dissolution, the solutions are not more opalescent than reference suspension II (2.2.1). The absorbance (2.2.25) of the solution in water measured at 430 nm is not greater than 0.15.

pH (2.2.3). Dissolve 2.0 g in carbon dioxide-free water R and dilute to 20 ml with the same solvent. The pH of the solution, measured 10 min after dissolution, is 8.0 to 10.0.

Specific optical rotation (2.2.7). Dissolve 62.5 mg in a 4 g/l solution of potassium hydrogen phthalate R and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 258 to + 287, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject 50 µl of reference solution (d) and elute isocratically until elution of the ampicillin peak. Inject 50 µl of test solution (b) and start the elution isocratically. Immediately after elution of the ampicillin peak start the following linear gradient. If the mobile phase composition has been adjusted to achieve the required resolution, the adjusted composition will apply at time zero in the gradient.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 30	85 → 0	15 → 100	linear gradient
30 - 45	0	100	isocratic
45 - 60	85	15	re-equilibration

Inject mobile phase A and use the same elution pattern to obtain a blank. Inject reference solution (e) and use the same elution pattern. The chromatogram obtained with reference solution (e), shows an ampicillin peak and a dimer peak, with a retention time of 2.8 relative to ampicillin. In the chromatogram obtained with test solution (b), the area of any peak corresponding to ampicillin dimer is not greater than 4.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (4.5 per cent); the area of any peak, apart from the principal peak and any peak corresponding to ampicillin dimer, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (d) (2 per cent). Disregard any peak due to the blank.

N,N-Dimethylaniline (2.4.26, Method B). Not more than 20 ppm.

2-Ethylhexanoic acid (2.4.28). Not more than 0.8 per cent m/m.

Methylene chloride. Not more than 0.2 per cent m/m, determined by gas chromatography (2.2.28), using ethylene chloride R as the internal standard.

Internal standard solution. Dissolve 1.0 ml of ethylene chloride R in water R and dilute to 500.0 ml with the same solvent.

Test solution (a). Dissolve 1.0 g of the substance to be examined in water R and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 1.0 g of the substance to be examined in water R, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with water R.

Reference solution. Dissolve 1.0 ml of methylene chloride R in water R and dilute to 500.0 ml with the same solvent. To 1.0 ml of the solution add 1.0 ml of the internal standard solution and dilute to 10.0 ml with water R.

The chromatographic procedure may be carried out using:

- a glass column 1.5 m long and 4 mm in internal diameter packed with diatomaceous earth for gas chromatography R impregnated with 10 per cent m/m of macrogol 1000 R,
- nitrogen for chromatography R as the carrier gas at a flow rate of 40 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 60 °C, that of the injection port at 100 °C and that of the detector at 150 °C. Calculate the content of methylene chloride taking its density at 20 °C to be 1.325 g/ml.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Water (2.5.12). Not more than 2.0 per cent, determined on 0.300 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.15 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 31.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 ml with mobile phase A.

Test solution (b). Prepare immediately before use. Dissolve 31.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dissolve 27.0 mg of anhydrous ampicillin CRS in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (b). Dissolve 2.0 mg of cefradine CRS in mobile phase A and dilute to 50 ml with mobile phase A. To 5.0 ml of the solution add 5.0 ml of reference solution (a).

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 25.0 ml with mobile phase A.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A.

Reference solution (e). To 0.20 g of the substance to be examined add 1.0 ml of water R. Heat the solution at 60 °C for 1 h. Dilute 0.5 ml of the solution to 50.0 ml with mobile phase A.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with octadecylsilyl silica gel for chromatography R (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. A mixture of 0.5 ml of dilute acetic acid R, 50 ml of 0.2 M potassium dihydrogen phosphate R and 50 ml of acetonitrile R, diluted to 1000 ml with water R,

Mobile phase B. A mixture of 0.5 ml of dilute acetic acid R, 50 ml of 0.2 M potassium dihydrogen phosphate R and 400 ml of acetonitrile R, diluted to 1000 ml with water R,

- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with a mobile phase with A:B ratio of 85:15. Inject 50 µl of reference solution (b). The assay is not valid unless in the chromatogram obtained, the resolution between the two principal peaks is at least 3.0. If necessary, adjust the A:B ratio of the mobile phase. The mass distribution ratio for the first peak (ampicillin) is 2.0 to 2.5. Inject 50 µl of reference solution (c). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation for the area of the principal peak is at most 1.0 per cent. Inject alternately test solution (a) and reference solution (a).

Calculate the percentage content of ampicillin sodium by multiplying the percentage content of ampicillin by 1.063.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- B. (2*S*,5*R*,6*R*)-6-[(2*S*)-2-amino-2-phenylacetyl]amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (L-ampicillin),

AMPICILLIN TRIHYDRATE

Ampicillinum trihydricum

$C_{16}H_{19}N_3O_4S \cdot 3H_2O$

M_r 403.5

DEFINITION

Ampicillin trihydrate contains not less than 96.0 per cent and not more than the equivalent of 100.5 per cent of (2*S*,5*R*,6*R*)-6-[(2*R*)-2-amino-2-phenylacetyl]amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, slightly soluble in water, practically insoluble in alcohol and in fatty oils. It dissolves in dilute solutions of acids and of alkali hydroxides.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ampicillin trihydrate CRS*.

B. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (a). Dissolve 25 mg of *ampicillin trihydrate CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Reference solution (b). Dissolve 25 mg of *amoxicillin trihydrate CRS* and 25 mg of *ampicillin trihydrate CRS* in 10 ml of *sodium hydrogen carbonate solution R*.

Apply separately to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R* and 90 volumes of a 154 g/l solution of *ammonium acetate R*, the pH of which has been adjusted to 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

D. It complies with the test for water (see Tests).

TESTS

Appearance of solution. Dissolve 1.0 g in 10 ml of 1 *M hydrochloric acid*. Separately dissolve 1.0 g in 10 ml of *dilute ammonia R2*. Immediately after dissolution, the solutions are not more opalescent than reference suspension II (2.2.1).

pH (2.2.3). Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 40 ml with the same solvent. The pH of the solution is 3.5 to 5.5.

Specific optical rotation (2.2.7). Dissolve 62.5 mg in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 280 to + 305, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject reference solution (c) and elute isocratically. Inject freshly prepared test solution (b) and start the elution isocratically. Immediately after elution of the ampicillin peak start the following linear gradient. If the mobile phase composition has been adjusted to achieve the required resolution, the adjusted composition will apply at time zero in the gradient.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0	85	15
30	0	100
45	0	100

Equilibrate the column with the originally chosen mobile phase for 15 min. Inject mobile phase A and use the same elution gradient to obtain a blank. In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak and any peak observed in the blank chromatogram, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

***N,N*-Dimethylaniline** (2.4.26, *Method B*). Not more than 20 ppm.

Water (2.5.12). 12.0 per cent to 15.0 per cent, determined on 0.100 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.5 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 31.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 ml with the same solvent.

Test solution (b). Dissolve 31.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 27.0 mg of *anhydrous ampicillin CRS* in mobile phase A and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dissolve 2.0 mg of *cefradine CRS* in mobile phase A and dilute to 50 ml with the same solvent. To 5.0 ml of this solution add 5.0 ml of reference solution (a).

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with mobile phase A.

Reference solution (d). Dilute 1.0 ml of reference solution (c) to 25.0 ml with mobile phase A.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min:
Mobile phase A. A mixture of 0.5 ml of *dilute acetic acid R*, 50 ml of 0.2 M *potassium dihydrogen phosphate R*, 50 ml of *acetonitrile R* diluted to 1000 ml with *water R*,
Mobile phase B. A mixture of 0.5 ml of *dilute acetic acid R*, 50 ml of 0.2 M *potassium dihydrogen phosphate R* and 400 ml of *acetonitrile R* diluted to 1000 ml with *water R*,
- as detector a spectrophotometer set at 254 nm,
- a 50 µl loop injector.

Equilibrate the column with a mobile phase with ratio A:B of 85:15. Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is at least 3.0. If necessary, adjust the ratio A:B of the mobile phase. The mass distribution ratio for the first peak (ampicillin) is 2.0 to 2.5. Inject reference solution (d). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation for the area of the principal peak is at most 1.0 per cent. Inject alternately test solution (a) and reference solution (a).

Calculate the percentage content of ampicillin.

STORAGE

Store in an airtight container, at a temperature not exceeding 30 °C.

IMPURITIES

- A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- B. (2*S*,5*R*,6*R*)-6-[(2*S*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (L-ampicillin),

- C. (4*S*)-2-(3,6-dioxo-5-phenylpiperazin-2-yl)-5,5-dimethylthiazolidine-4-carboxylic acid (diketopiperazines of ampicillin),

- D. R = CO₂H: (4*S*)-2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]carboxymethyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of ampicillin),

- F. R = H: (2*RS*,4*S*)-2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of ampicillin),

- E. (2*R*)-2-[[[(2*S*,5*R*,6*R*)-6-[(2*R*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]amino]-2-phenylacetic acid (ampicillinyl-D-phenylglycine),

- G. (3*R*,6*R*)-3,6-diphenylpiperazine-2,5-dione,

- H. 3-phenylpyrazin-2-ol,

- I. (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-[(2*R*)-2-amino-2-phenylacetyl]amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (D-phenylglycylampicillin),

- J. (2*S*,5*R*,6*R*)-6-[(2,2-dimethylpropanoyl)amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid,

- K. (2*R*)-2-[(2,2-dimethylpropanoyl)amino]-2-phenylacetic acid,

- L. (2*R*)-2-amino-2-phenylacetic acid (D-phenylglycine),

- M. co-oligomers of ampicillin and of penicilloic acids of ampicillin.

Content: minimum 2.0 ml/kg of essential oil (dried drug).

CHARACTERS

Bitter taste.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The rhizome is greyish-brown or reddish-brown, transversely annulated. The base bears greyish-brown or reddish-brown, cylindrical, longitudinally furrowed, occasionally branched roots often with incompletely encircling, transverse ridges. The apex sometimes shows remnants of stem and leaf bases. The fracture is uneven. The transversely cut surface shows a greyish-white, spongy, distinctly radiate bark, in which the secretory channels are visible as brown spots, and a bright yellow to greyish-yellow wood which, in the rhizome, surrounds the greyish or brownish-white pith.
- B. Reduce to a powder (355). The powder is brownish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows: fragments of cork consisting of several layers of thin-walled greyish-brown or reddish-brown cells; fragments of large, yellowish-brown secretory channels; fragments of medullary rays 2 to 4 cells wide; fragments of xylem with medullary rays and radially arranged, lignified vessels with reticulate thickening. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous, simple starch granules 2 µm to 4 µm in diameter.
- C. Examine the chromatograms obtained in the test for lovage root.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Reference solution	Test solution

TESTS

Lovage root. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the freshly powdered drug (355) add 5 ml of *methanol R* and boil for 30 s. Cool and filter.

Reference solution. Dissolve 5 mg of *coumarin R* and 25 µl of *eugenol R* in 10 ml of *methanol R*.

Plate: *TLC silica gel F₂₅₄ plate R*.

Mobile phase: *methylene chloride R*, *toluene R* (50:50 *V/V*).

Application: 20 µl, as bands.

Development: twice over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm. Mark the quenching zones due to coumarin and eugenol on the chromatogram obtained with the reference solution. Examine in ultraviolet light at 365 nm.

01/2005:1857

ANGELICA ROOT

Angelicae radix

DEFINITION

Whole or cut, carefully dried rhizome and root of *Angelica archangelica* L. (*Archangelica officinalis* Hoffm.).

Results: the chromatogram obtained with the test solution shows no pale blue to white fluorescent zone between the zones of coumarin and eugenol in the chromatogram obtained with the reference solution.

Foreign matter (2.8.2): maximum 5 per cent of leaf bases and stem bases, maximum 5 per cent of discoloured pieces and maximum 1 per cent of other foreign matter.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 10.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1): maximum 2.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Reduce the drug to a powder (500) and immediately use 40.0 g for the determination. Use a 2 litre round-bottomed flask, 10 drops of *liquid paraffin R*, 500 ml of *water R* as distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 4 h.

ANISE OIL

Anisi aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the dry ripe fruits of *Pimpinella anisum L.*

CHARACTERS

Appearance: clear, colourless or pale yellow liquid.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 1 g of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 µl of *linalol R*, 30 µl of *anisaldehyde R* and 200 µl of *anethole R* in *toluene R* and dilute to 15 ml with the same solvent. Dilute 1 ml of this solution to 5 ml with *toluene R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *ethyl acetate R*, *toluene R* (7:93 V/V).

Application: 5 µl as bands of 10 mm (for normal TLC plates) or 2 µl as bands of 10 mm (for fine particle size plates).

Development: over a path of 15 cm (for normal TLC plates) or over a path of 6 cm (for fine particle size plates).

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a quenching zone _____	A very strong quenching zone (anethole) _____
Anisaldehyde: a quenching zone _____	A quenching zone A quenching zone (anisaldehyde) _____
Reference solution	Test solution

Detection B: spray with *methyl 4-acetylbenzoate reagent R* and heat at 100-105 °C for 10 min; examine the still hot plate in daylight within 5 min.

Results B: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a brown zone _____	A violet-brown zone (monoterpene hydrocarbons) (solvent front) A very strong brown zone (anethole), distinctly separated _____
Anisaldehyde: a yellow zone _____	A grey zone A yellow zone (anisaldehyde) _____
Linalol: a grey zone	A grey zone (linalol) A grey zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.980 to 0.990.

Refractive index (2.2.6): 1.552 to 1.561.

Freezing point (2.2.18): 15 °C to 19 °C.

Fenchone. Gas chromatography (2.2.28) as described in the test for chromatographic profile with the following modifications.

Test solution. Dissolve 400 µl of the substance to be examined in 2.0 ml of *hexane R*.

Reference solution (a). Dilute 10 µl of *fenchone R* to 1.2 g with *hexane R*.

Reference solution (b). Dilute 100 µl of reference solution (a) to 100 ml with *hexane R*.

System suitability: reference solution (b):

— *signal-to-noise ratio*: minimum 10 for the principal peak.

Limit:

— *fenchone*: maximum 0.01 per cent.

Foeniculin. Gas chromatography (2.2.28) as described in the test for chromatographic profile with the following modifications.

Test solution. The substance to be examined.

Reference solution (a). Dilute 10 mg of the test solution to 1.000 g with *hexane R*. Dilute 0.5 ml of this solution to 100 ml with *hexane R*.

Reference solution (b). *Foeniculin* for peak identification CRS.

System suitability:

- the chromatogram obtained with reference solution (b) is similar to the chromatogram provided with *foeniculin* for peak identification CRS,
- *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (a).

Limit: locate the peak due to foeniculin by comparison with the chromatogram provided with *foeniculin* for peak identification CRS.

- *foeniculin*: maximum 0.01 per cent.

Fatty oils and resinified essential oils (2.8.7). It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dissolve 200 µl of the substance to be examined in 1.0 ml of *hexane R*.

Reference solution. To 1.0 ml of *hexane R*, add 20 µl of *linalol R*, 20 µl of *estragole R*, 20 µl of *α-terpineol R*, 60 µl of *anethole R* and 30 µl of *anisaldehyde R*.

Column:

- *material*: fused silica,
- *size*: $l = 30$ m, $\varnothing = 0.25$ mm,
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.0 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 – 5	60
	5 – 80	60 → 210
	80 – 95	210
Injection port		200
Detector		220

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

- *resolution*: minimum 1.5 between the peaks due to *estragole* and *α-terpineol*.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution and locate *cis*-anethole and *pseudoisoeugenyl 2-methylbutyrate* using the chromatogram shown in Figure 0804.-1 (disregard any peak due to *hexane*). Determine the percentage content of these components. The percentages are within the following ranges:

- *linalol*: less than 1.5 per cent,
- *estragole*: 0.5 per cent to 5.0 per cent,
- *α-terpineol*: less than 1.2 per cent,
- *cis*-anethole: 0.1 per cent to 0.4 per cent,
- *trans*-anethole: 87 per cent to 94 per cent,
- *anisaldehyde*: 0.1 per cent to 1.4 per cent,
- *pseudoisoeugenyl 2-methylbutyrate*: 0.3 per cent to 2.0 per cent.

Figure 0804.-1. – Chromatogram for the test for chromatographic profile of anise oil

STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

01/2005:0262

ANISEED

Anisi fructus

DEFINITION

Aniseed consists of the whole dry cremocarp of *Pimpinella anisum* L. It contains not less than 20 ml/kg of essential oil.

CHARACTERS

Aniseed has an odour reminiscent of anethole.

The fruit is a cremocarp and generally entire; a small fragment of the thin, rigid, slightly curved pedicel is frequently attached.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The cremocarp is ovoid or pyriform and slightly compressed laterally, yellowish-green or greenish-grey, 3 mm to 5 mm long and up to 3 mm wide, surmounted by a stylopod with 2 short, reflexed stylar points. The mericarps are attached by their tops to the carpophore with a plane commissural surface and a convex dorsal surface, the latter being covered with short, warty trichomes visible using a lens; the fruit shows 5 primary ridges, running longitudinally, comprising 3 dorsal ridges and 2 lateral ridges, non-prominent, and lighter in colour.
- B. Reduce to a powder (355). The powder is greenish-yellow to brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: whole or broken trichomes, mostly unicellular, sometimes curved, with blunt apex and warty cuticle; fragments of epidermis with striated cuticle, occasional anomocytic stomata; fragments of numerous narrow, branched vittae, fragments of endosperm containing aleurone grains and micro-rosettes of calcium oxalate; oblong sclereids from the commissural zone and bundles of sclerenchymatous fibres from the carpophore and the pedicel. Starch is absent.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.
Test solution. Shake 0.10 g of the powdered drug (1500) with 2 ml of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath at 60 °C. Dissolve the residue in 0.5 ml of *toluene R*.
Reference solution. Dissolve 3 µl of *anethole R* and 40 µl of *olive oil R* in 1 ml of *toluene R*.
 Apply to the plate at 2 cm intervals 2 µl and 3 µl of the test solution and 1 µl, 2 µl and 3 µl of the reference solution. Develop over a path of 10 cm using *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatograms show a quenching zone (anethole) in the central part against a light background. Spray the plate with a freshly prepared 200 g/l solution of *phosphomolybdic acid R* in *alcohol R*, using 10 ml for a plate 200 mm square, and heat at 120 °C for 5 min. The spots corresponding to anethole appear blue against a yellow background. In the chromatogram obtained with 2 µl of the test solution, the spot corresponding to anethole is intermediate in size between the spots

corresponding to anethole in the chromatograms obtained with 1 µl and 3 µl of the reference solution. The chromatograms obtained with the test solution show in the lower third a blue spot (triglycerides) similar in position to the spot in the lower third of the chromatograms obtained with the reference solution (triglycerides of olive oil).

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter.

Water (2.2.13). Not more than 70 ml/kg, determined by distillation on 20.0 g of the powdered drug.

Total ash (2.4.16). Not more than 12.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 2.5 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use a 250 ml round-bottomed flask, 100 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Reduce the drug to a coarse powder and immediately use 10.0 g for the determination. Distil at a rate of 2.5-3.5 ml/min for 2 h.

STORAGE

Store protected from light.

01/2005:0972

ANTAZOLINE HYDROCHLORIDE

Antazolini hydrochloridum

C₁₇H₂₀ClN₃M_r 301.8

DEFINITION

Antazoline hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N*-benzyl-*N*[(4,5-dihydro-1*H*-imidazol-2-yl)methyl]aniline hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water, soluble in alcohol, slightly soluble in methylene chloride.

It melts at about 240 °C, with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *antazoline hydrochloride CRS*. Examine the substances as discs prepared using *potassium chloride R*.
- B. Examine the chromatograms obtained in the test for related substances in daylight after spraying. The principal spot in the chromatogram obtained with test

solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (b).

- C. To 5 ml of solution S (see Tests) add, drop by drop, *dilute sodium hydroxide solution R* until an alkaline reaction is produced. Filter. The precipitate, washed with two quantities, each of 10 ml, of *water R* and dried in a desiccator under reduced pressure, melts (2.2.14) at 119 °C to 123 °C.

- D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* prepared from *distilled water R*, heating at 60 °C if necessary. Allow to cool and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.2 ml of *methyl red solution R*. Not more than 0.1 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance. Heat the plate at 110 °C for 15 min before using.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with *methanol R*.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100 ml with *methanol R*.

Reference solution (b). Dissolve 20 mg of *antazoline hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (c). Dissolve 20 mg of *xylometazoline hydrochloride CRS* in 1 ml of test solution (a) and dilute to 5 ml with *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *diethylamine R*, 10 volumes of *methanol R* and 85 volumes of *ethyl acetate R*. Dry the plate in a current of warm air for 15 min. Examine in ultraviolet light at 254 nm. The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots. Spray with a mixture of equal volumes of a 200 g/l solution of *ferric chloride R* and a 5 g/l solution of *potassium ferricyanide R*. Examine immediately in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Dissolve 0.250 g in 100 ml of *alcohol R*. Add 0.1 ml of *phenolphthalein solution R1*. Titrate with 0.1 M *alcoholic potassium hydroxide*.

1 ml of 0.1 M *alcoholic potassium hydroxide* is equivalent to 30.18 mg of C₁₇H₂₀ClN₃.

IMPURITIES

- A. *N*-(2-aminoethyl)-2-(benzylphenylamino)acetamide.

01/2005:0209

ANTICOAGULANT AND PRESERVATIVE SOLUTIONS FOR HUMAN BLOOD

Solutiones anticoagulantes et sanguinem humanum conservantes

DEFINITION

Anticoagulant and preservative solutions for human blood are sterile and pyrogen-free solutions prepared with water for injections, filtered, distributed in the final containers and sterilised. The content of sodium citrate (C₆H₅Na₃O₇·2H₂O), glucose monohydrate (C₆H₁₂O₆·H₂O) or anhydrous glucose (C₆H₁₂O₆) and sodium dihydrogen phosphate dihydrate (NaH₂PO₄·2H₂O) is not less than 95.0 per cent and not more than 105.0 per cent of that stated in the formulae below. The content of citric acid monohydrate (C₆H₈O₇·H₂O) or anhydrous citric acid (C₆H₈O₇) is not less than 90.0 per cent and not more than 110.0 per cent of that stated in the formulae below. Subject to agreement by the competent authority, other substances, such as red-cell preservatives, may be included in the formula provided that their name and concentration are stated on the label.

Anticoagulant and preservative solutions for human blood are presented in airtight, tamper-proof containers of glass (3.2.1) or plastic (3.2.3).

Anticoagulant acid-citrate-glucose solutions (ACD)

	A	B
<i>Sodium citrate (0412)</i>	22.0 g	13.2 g
<i>Citric acid monohydrate (0456)</i>	8.0 g	4.8 g
or <i>Citric acid, anhydrous (0455)</i>	7.3 g	4.4 g
<i>Glucose monohydrate (0178)*</i>	24.5 g	14.7 g
or <i>Glucose, anhydrous (0177)*</i>	22.3 g	13.4 g
<i>Water for injections (0169) to</i>	1000.0 ml	1000.0 ml
Volume to be used per 100 ml of blood	15.0 ml	25.0 ml

*The competent authority may require that the substances comply with the test for pyrogens given in the monographs on *Glucose monohydrate (0178)* and *Glucose, anhydrous (0177)*, respectively.

CHARACTERS

A colourless or faintly yellow, clear liquid, practically free from particles.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dilute 2 ml of the solution to be examined (for formula A) or 3 ml (for formula B) to 100 ml with a mixture of 2 volumes of *water R* and 3 volumes of *methanol R*.

Reference solution (a). Dissolve 10 mg of *glucose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg each of *glucose CRS*, *lactose CRS*, *fructose CRS* and *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Apply separately to the plate 2 µl of each solution and thoroughly dry the starting points. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*. The volumes of solvents have to be measured accurately since a slight excess of water produces cloudiness. Dry the plate in a current of warm air. Repeat the development immediately, after renewing the mobile phase. Dry the plate in a current of warm air and spray evenly with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *alcohol R*. Heat at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

- B. To 2 ml add 5 ml of *cupri-citric solution R*. Heat to boiling. An orange precipitate is formed and the solution becomes yellow.
- C. To 2 ml (for formula A) add 3 ml of *water R* or to 4 ml (for formula B) add 1 ml of *water R*. The solution gives the reaction of citrates (2.3.1).
- D. 0.5 ml gives reaction (b) of sodium (2.3.1).

TESTS

pH (2.2.3). The pH of the solution to be examined is 4.7 to 5.3.

Hydroxymethylfurfural. To 2.0 ml add 5.0 ml of a 100 g/l solution of *p-toluidine R* in *2-propanol R* containing 10 per cent V/V of *glacial acetic acid R* and 1.0 ml of a 5 g/l solution of *barbituric acid R*. The absorbance (2.2.25), determined at 550 nm after allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using 2.0 ml of a solution containing 5 ppm of *hydroxymethylfurfural R* for formula A or 3 ppm of *hydroxymethylfurfural R* for formula B.

Sterility (2.6.1). They comply with the test for sterility.

Pyrogens (2.6.8). They comply with the test for pyrogens. Dilute with a pyrogen-free, 9 g/l solution of *sodium chloride R* to obtain a solution containing approximately 5 g/l of sodium citrate. Inject 10 ml of the diluted solution per kilogram of the rabbit's mass.

ASSAY

Citric acid. To 10.0 ml (for formula A) or to 20.0 ml (for formula B) add 0.1 ml of *phenolphthalein solution R1*. Titrate with 0.2 M *sodium hydroxide* until a pink colour is obtained.

1 ml of 0.2 M *sodium hydroxide* is equivalent to 14.01 mg of $C_6H_8O_7 \cdot H_2O$ or to 12.81 mg of $C_6H_8O_7$.

Sodium citrate. Prepare a chromatography column 0.10 m long and 10 mm in internal diameter and filled with *strongly acidic ion-exchange resin R* (300 µm to 840 µm). Maintain a 1 cm layer of liquid above the resin at all times. Wash the column with 50 ml of de-ionised *water R* at a flow rate of 12-14 ml/min.

Dilute 10.0 ml of the solution to be examined (for formula A) or 15.0 ml (for formula B) to about 40 ml with de-ionised *water R* in a beaker and transfer to the column reservoir, washing the beaker 3 times with a few millilitres of de-ionised *water R*. Allow the solution to run through the column at a flow rate of 12-14 ml/min and collect the eluate. Wash the column with 2 quantities, each of 30 ml, and with one quantity of 50 ml, of de-ionised *water R*. The column can be used for 3 successive determinations before regeneration with 3 times its volume of *dilute hydrochloric acid R*. Titrate the combined eluate and washings (about 150 ml) with 0.2 M *sodium hydroxide*, using 0.1 ml of *phenolphthalein solution R1* as indicator.

Calculate the content of sodium citrate in grams per litre from the following expressions:

For formula A: $1.961n - 1.40C$

or $1.961n - 1.53C'$

For formula B: $1.307n - 1.40C$

or $1.307n - 1.53C'$

n = number of millilitres of 0.2 M *sodium hydroxide* used in the titration,

C = content of citric acid monohydrate in grams per litre determined as prescribed above,

C' = content of anhydrous citric acid in grams per litre determined as prescribed above.

Reducing sugars. Dilute 5.0 ml (for formula A) or 10.0 ml (for formula B) to 100.0 ml with *water R*. Introduce 25.0 ml of the solution into a 250 ml conical flask with ground-glass neck and add 25.0 ml of *cupri-citric solution R1*. Add a few pieces of porous material, attach a reflux condenser, heat so that boiling begins within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 ml of *water R*. Add 25 ml of a 25 per cent m/m solution of *sulphuric acid R* with caution and in small quantities. Titrate with 0.1 M *sodium thiosulphate* using 0.5 ml of *starch solution R*, added towards the end of the titration, as indicator (n_1 ml). Carry out a blank titration using 25.0 ml of *water R* (n_2 ml).

Calculate the content of reducing sugars as anhydrous glucose or as glucose monohydrate, as appropriate, from the Table 0209-1.

Table 0209.1

Volume of 0.1 M sodium thiosulphate ($n_2 - n_1$ ml)	Anhydrous glucose in milligrams	Glucose mono- hydrate in milligrams
8	19.8	21.6
9	22.4	24.5
10	25.0	27.2
11	27.6	30.2
12	30.3	33.1
13	33.0	36.1
14	35.7	39.0
15	38.3	42.1
16	41.3	45.2

STORAGE

Store in an airtight, tamper-proof container, protected from light.

LABELLING

The label states:

- the composition and volume of the solution,
- the maximum amount of blood to be collected in the container.

Anticoagulant citrate-phosphate-glucose solution (CPD)

<i>Sodium citrate</i> (0412)	26.3 g
<i>Citric acid monohydrate</i> (0456)	3.27 g
or <i>Citric acid, anhydrous</i> (0455)	2.99 g
<i>Glucose monohydrate</i> (0178)*	25.5 g
or <i>Glucose, anhydrous</i> (0177)*	23.2 g
<i>Sodium dihydrogen phosphate dihydrate</i> (0194)	2.51 g
<i>Water for injections</i> (0169) to	1000.0 ml
Volume to be used per 100 ml of blood	14.0 ml

*The competent authority may require that the substances comply with the test for pyrogens given in the monographs on *Glucose monohydrate* (0178) and *Glucose, anhydrous* (0177), respectively.

CHARACTERS

A colourless or faintly yellow, clear liquid, practically free from particles.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dilute 2 ml of the solution to be examined to 100 ml with a mixture of 2 volumes of *water R* and 3 volumes of *methanol R*.

Reference solution (a). Dissolve 10 mg of *glucose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg each of *glucose CRS*, *lactose CRS*, *fructose CRS* and *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Apply separately to the plate 2 µl of each solution and thoroughly dry the starting points. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*. The volumes of solvents have to be measured accurately since a slight excess of water produces cloudiness. Dry the plate in a current of warm air. Repeat the development immediately, after renewing the mobile phase. Dry the plate in a current of warm air and spray evenly with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *alcohol R*. Heat at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

B. To 2 ml add 5 ml of *cupri-citric solution R*. Heat to boiling. An orange precipitate is formed and the solution becomes yellow.

C. To 2 ml add 3 ml of *water R*. The solution gives the reaction of citrates (2.3.1).

D. 1 ml gives reaction (b) of phosphates (2.3.1).

E. 0.5 ml gives reaction (b) of sodium (2.3.1).

TESTS

pH (2.2.3). The pH of the solution is 5.3 to 5.9.

Hydroxymethylfurfural. To 2.0 ml add 5.0 ml of a 100 g/l solution of *p-toluidine R* in *2-propanol R* containing 10 per cent V/V of *glacial acetic acid R* and 1.0 ml of a 5 g/l solution of *barbituric acid R*. The absorbance (2.2.25), determined at 550 nm after allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using 2.0 ml of a solution containing 5 ppm of *hydroxymethylfurfural R*.

Sterility (2.6.1). They comply with the test for sterility.

Pyrogens (2.6.8). They comply with the test for pyrogens. Dilute with a pyrogen-free, 9 g/l solution of *sodium chloride R* to obtain a solution containing approximately 5 g/l of sodium citrate. Inject 10 ml of the diluted solution per kilogram of the rabbit's mass.

ASSAY

Sodium dihydrogen phosphate. Dilute 10.0 ml to 100.0 ml with *water R*. To 10.0 ml of this solution add 10.0 ml of *nitro-vanado-molybdic reagent R*. Mix and allow to stand at 20 °C to 25 °C for 30 min. At the same time and in the same manner, prepare a reference solution using 10.0 ml of a standard solution containing 0.219 g of *potassium dihydrogen phosphate R* per litre. Measure the absorbance (2.2.25) of the 2 solutions at 450 nm using as the compensation liquid a solution prepared in the same manner using 10 ml of *water R*. Calculate the content of sodium dihydrogen phosphate dihydrate (P) in grams per litre from the expression:

$$\frac{11.46 \times C \times A_1}{A_2}$$

C = concentration of *potassium dihydrogen phosphate R* in the standard solution in grams per litre,

A_1 = absorbance of the test solution,

A_2 = absorbance of the reference solution.

Citric acid. To 20.0 ml add 0.1 ml of *phenolphthalein solution R1* and titrate with 0.2 M sodium hydroxide.

Calculate the content of citric acid monohydrate (C), or anhydrous citric acid (C'), in grams per litre from the equations:

$$C = 0.7005n - 0.4490P$$

$$C' = 0.6404n - 0.4105P$$

n = number of millilitres of 0.2 M sodium hydroxide used in the titration,

P = content of sodium dihydrogen phosphate dihydrate in grams per litre determined as prescribed above.

Sodium citrate. Prepare a chromatography column 0.10 m long and 10 mm in internal diameter and filled with *strongly acidic ion-exchange resin R* (300 µm to 840 µm). Maintain a 1 cm layer of liquid above the resin at all times. Wash the column with 50 ml of de-ionised *water R* at a flow rate of 12-14 ml/min.

Dilute 10.0 ml of the solution to be examined to about 40 ml with de-ionised *water R* in a beaker and transfer to the column reservoir, washing the beaker 3 times with a few millilitres of de-ionised *water R*. Allow the solution to run through the column at a flow rate of 12-14 ml/min and collect the eluate. Wash the column with 2 quantities, each of 30 ml, and with one quantity of 50 ml, of de-ionised *water R*. The column can be used for 3 successive determinations before regeneration with 3 times its volume of *dilute hydrochloric acid R*. Titrate the combined eluate and washings (about 150 ml) with 0.2 M sodium hydroxide, using 0.1 ml of *phenolphthalein solution R1* as indicator.

Calculate the content of sodium citrate in grams per litre from the following expressions:

$$1.961n - 1.257P - 1.40C$$

$$1.961n - 1.257P - 1.53C'$$

n = number of millilitres of 0.2 M sodium hydroxide used in the titration,

P = content of sodium dihydrogen phosphate dihydrate in grams per litre determined as prescribed above,

C = content of citric acid monohydrate in grams per litre determined as prescribed above,

C' = content of anhydrous citric acid in grams per litre determined as prescribed above.

Reducing sugars. Dilute 5.0 ml to 100.0 ml with *water R*. Introduce 25.0 ml of the solution into a 250 ml conical flask with ground-glass neck and add 25.0 ml of *cupri-citric solution R1*. Add a few pieces of porous material, attach a reflux condenser, heat so that boiling begins within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 ml of *water R*. Add 25 ml of a 25 per cent *m/m* solution of *sulphuric acid R* with caution and in small quantities. Titrate with 0.1 M sodium thiosulphate using 0.5 ml of *starch solution R*, added towards the end of the titration, as indicator (*n*₁ ml). Carry out a blank titration using 25.0 ml of *water R* (*n*₂ ml).

Calculate the content of reducing sugars as anhydrous glucose or as glucose monohydrate, as appropriate, from the Table 0209-1.

STORAGE

Store in an airtight, tamper-proof container, protected from light.

LABELLING

The label states:

- the composition and volume of the solution,
- the maximum amount of blood to be collected in the container.

01/2005:1928

ANTI-T LYMPHOCYTE IMMUNOGLOBULIN FOR HUMAN USE, ANIMAL

Immunoglobulinum anti-T lymphocytorum ex animale ad usum humanum

DEFINITION

Anti-T lymphocyte animal immunoglobulin for human use is a liquid or freeze-dried preparation containing immunoglobulins, obtained from serum or plasma of animals, mainly rabbits or horses, immunised with human lymphocytic antigens.

The immunoglobulin has the property of diminishing the number and function of immunocompetent cells, in particular T-lymphocytes. The preparation contains principally immunoglobulin G. It may contain antibodies against other lymphocyte subpopulations and against other cells. The preparation is intended for intravenous administration, after dilution with a suitable diluent where applicable.

Applicable provisions of the monograph on *Immunosera for human use, animal* (0084) are stated below.

PRODUCTION

GENERAL PROVISIONS

The production method has been shown to yield consistently immunoglobulins of acceptable safety, potency in man and stability.

Any reagent of biological origin used in production shall be free of contamination with bacteria, fungi and viruses. The method of preparation includes a step or steps that have been shown to remove or inactivate known agents of infection.

During development studies, it shall be demonstrated that the production method yields a product that:

- does not transmit infectious agents,
- is characterised by a defined pattern of immunological activity, notably: antigen binding, complement-dependent and independent cytotoxicity, cytokine release, induction of T-cell activation, cell death,
- does not contain antibodies that cross-react with human tissues to a degree that would impair clinical safety,
- has a defined maximum content of anti-thrombocyte antibody activity,
- has a defined maximum content of haemoglobin.

The product has been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated.

Reference preparation. A batch shown to be suitable for checking the validity of the assay and whose efficacy has been demonstrated in clinical trials, or a batch representative thereof.

ANIMALS

The animals used are of a species approved by the competent authority, are healthy and exclusively reserved for production of anti-T lymphocyte immunoglobulin. They are tested and shown to be free from a defined list of infectious agents. The introduction of animals into a closed herd follows specified procedures, including definition of quarantine measures. Where appropriate, tests for additional specific agents are considered depending on the geographical localisation of the establishment used for the breeding and production of the animals. The feed originates from a controlled source and no animal proteins are added. The suppliers of animals are certified by the competent authority.

If the animals are treated with antibiotics, a suitable withdrawal period is allowed before collection of blood or plasma. The animals are not treated with penicillin antibiotics. If a live vaccine is administered, a suitable waiting period is imposed between vaccination and collection of serum or plasma for immunoglobulin production.

The species, origin and identification number of the animals are specified.

IMMUNISATION

The antigens used are identified and characterised, where appropriate. They are identified by their names and a batch number; information on the source and preparation are recorded.

The selected animals are isolated for at least 1 week before being immunised according to a defined schedule with booster injections at suitable intervals. Adjuvants may be used.

Animals are kept under general health surveillance and specific antibody production is controlled at each cycle of immunisation.

Animals are thoroughly examined before collection of blood or plasma. If an animal shows any pathological lesion not related to the immunisation process, it is not used, nor are any other of the animals in the group concerned, unless it is evident that their use will not impair the safety of the product.

Human antigens such as continuously growing T-lymphocyte cell lines or thymocytes are used to immunise the animals. Cells may be subjected to a sorting procedure. The immunising antigens are shown to be free from infectious agents by validated methods for relevant blood-borne pathogens, notably hepatitis B virus (HBV), hepatitis C virus (HCV) and human immunodeficiency virus (HIV) and other relevant adventitious agents originating from the preparation of the antigen. The cells used comply with defined requirements for purity of the cell population and freedom from adventitious agents.

COLLECTION OF BLOOD OR PLASMA

Collection of blood is made by venepuncture or plasmapheresis. The puncture area is shaved, cleaned and disinfected. The animals may be anaesthetised under conditions that do not influence the quality of the product.

No antimicrobial preservative is added to the plasma and serum samples. The blood or plasma is collected in such a manner as to maintain sterility of the product. The blood or plasma collection is conducted at a site separate from the area where the animals are kept or bred and the area where the immunoglobulin is purified. If the serum or plasma is stored before further processing, precautions are taken to avoid microbial contamination.

Several single plasma or serum samples may be pooled before purification. The single or pooled samples are tested before purification for the following tests.

Tests for contaminating viruses. Each pool is tested for contaminating viruses by suitable *in vitro* tests including inoculation to cell cultures capable of detecting a wide range of viruses relevant for the particular product. Where applicable, *in vitro* tests for contaminating viruses are carried out on the adsorbed pool, after the last production stage that may introduce viral contaminants.

PURIFICATION AND VIRAL INACTIVATION

The immunoglobulins are concentrated and purified by fractional precipitation, chromatography, immuno-adsorption or by other suitable chemical or physical methods. The methods are selected and validated to avoid contamination at all steps of processing and to avoid formation of protein aggregates that effect immunobiological characteristics of the product.

Unless otherwise justified and authorised, validated procedures are applied for removal and/or inactivation of viruses.

After purification and treatment for removal and/or inactivation of viruses, a stabiliser may be added to the intermediate product, which may be stored for a period defined in the light of stability data.

Only an intermediate product that complies with the following requirements may be used in the preparation of the final bulk.

If the method of preparation includes a step for adsorption of cross-reacting anti-human antibodies using material from human tissues and/or red blood cells, the human materials are submitted to a validated procedure for inactivation of infectious agents, unless otherwise justified and authorised. If erythrocytes are used for adsorption, the donors for such materials comply with the requirements for donors of blood and plasma of the monograph on *Human plasma for fractionation (0853)*. If other human material is used, it is shown by validated methods to be free from relevant blood-borne pathogens, notably HBV, HCV and HIV. If substances are used for inactivation or removal of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the anti-T lymphocyte immunoglobulin.

FINAL BULK

The final bulk is prepared from a single intermediate product or from a pool of intermediate products obtained from animals of the same species. A stabiliser may be added. No antimicrobial preservative is added either during the manufacturing procedure or for preparation of the final bulk solution. During manufacturing, the solution is passed through a bacteria-retentive filter.

FINAL LOT

The final bulk of anti-T-lymphocyte immunoglobulin is distributed aseptically into sterile, tamper-proof containers. The containers are closed as to prevent contamination. Only a final lot that complies with the requirements prescribed below under Identification, Tests and Assay may be released for use.

CHARACTERS

The liquid preparation is clear or slightly opalescent and colourless or pale yellow. The freeze-dried preparation is a white or slightly yellow powder or solid friable mass, which after reconstitution gives a liquid preparation corresponding to the description above.

IDENTIFICATION

A. Using a suitable range of species-specific antisera, carry out precipitation tests on the preparation to be examined. It is recommended that the test be carried

out using antisera specific to the plasma proteins of each species of domestic animal commonly used in the preparation of materials of biological origin in the country concerned and antisera specific to human plasma proteins. The preparation is shown to contain proteins originating from the animal used for the anti-T lymphocyte immunoglobulin production.

B. Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal serum of the animal used for production, compare this serum and the preparation to be examined, both diluted to a concentration that will allow a clear gammaglobulin precipitation arc to be obtained on the gel. The main component of the preparation to be examined corresponds to the IgG component of normal serum of the animal used for production.

C. The preparation complies with the assay.

TESTS

Solubility. To a container of the preparation to be examined, add the volume of the liquid for reconstitution stated on the label. The preparation dissolves completely within the time stated on the label.

Extractable volume (2.9.17). It complies with the requirement for extractable volume.

pH (2.2.3). The pH is within the limits approved for the particular product.

Osmolality (2.2.35): minimum 240 mosmol/kg after dilution, where applicable.

Proteins (2.5.33): 90 per cent to 110 per cent of the amount stated on the label.

Stabiliser. Determine the amount of stabiliser by a suitable physico-chemical method. The preparation contains not less than 80 per cent and not more than 120 per cent of the quantity stated on the label.

Distribution of molecular size. Size exclusion chromatography (2.2.30).

Test solution. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range 2-20 g/l is usually suitable.

Reference solution. Dilute *human immunoglobulin BRP* with a 9 g/l solution of *sodium chloride R* to the same protein concentration as the test solution.

Column:

- **size:** $l = 0.6$ m, $\varnothing = 7.5$ mm,
- **stationary phase:** *silica gel for size-exclusion chromatography R*, a grade suitable for fractionation of globular proteins in the molecular mass range of 20 000 to 200 000.

Mobile phase: dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R* and 11.688 g of *sodium chloride R* in 1 litre of *water R*.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 50-600 µg of protein.

Retention time: identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of dimer corresponds to polymers and aggregates.

System suitability:

- **reference solution:** the principal peak corresponds to IgG monomer and there is a peak corresponding to dimer with a retention time relative to monomer of 0.85 ± 0.05 ,
- **test solution:** the relative retentions of monomer and dimer are 1 ± 0.05 with reference to the corresponding peaks in the chromatogram obtained with the reference solution.

Limits:

- **total monomer and dimer:** at least 95 per cent of the total area of the peaks,
- **total polymers and aggregates:** maximum 5 per cent of the total area of the peaks.

Purity. Polyacrylamide gel electrophoresis (2.2.31), under non-reducing and reducing conditions.

Resolving gel. Non-reducing conditions: 8 per cent acrylamide; reducing conditions: 12 per cent acrylamide.

Test solution. Dilute the preparation to be examined to a protein concentration of 0.5-2 mg/ml.

Reference solution. Dilute the reference preparation to the same protein concentration as the test solution.

Application: 10 µl.

Detection: Coomassie staining.

Results: compared with the electropherogram of the reference solution, no additional bands are found in the electropherogram of the test solution.

Anti-A and anti-B haemagglutinins (2.6.20). The 1 to 64 dilution does not show agglutination.

Where applicable, dilute the preparation to be examined as prescribed for use before preparing the dilutions for the test.

Haemolysins. Prepare a 1 to 64 dilution of the preparation to be examined, diluted if necessary as stated on the label. Take 6 aliquots of the 1 to 64 dilution. To 1 volume of 3 of the aliquots, add 1 volume of a 10 per cent V/V suspension of group A1, group B and group O erythrocytes in a 9 g/l solution of *sodium chloride R*, respectively. To 1 volume of the remaining 3 aliquots, add 1 volume of a 10 per cent V/V suspension of group A1, group B and group O erythrocytes in a 9 g/l solution of *sodium chloride R*, respectively, and to each aliquot 1 volume of fresh group AB serum (as a source of complement). Mix and incubate at 37 °C for 1 h. Examine the supernatant liquids for haemolysis. No signs of haemolysis are present.

Thrombocyte antibodies. Examined by a suitable method, the level of thrombocyte antibodies is shown to be below that approved for the specific product.

Water (2.5.12): maximum 3 per cent.

Sterility (2.6.1). It complies with the test for sterility.

Pyrogens (2.6.8). Unless otherwise justified and authorised, it complies with the test for pyrogens. Unless otherwise prescribed, inject 1 ml per kilogram of the rabbit's body mass.

ASSAY

The biological activity is determined by measuring the complement-dependent cytotoxicity on target cells. Flow cytometry is performed with read-out of dead cells stained using propidium iodide. The activity is expressed as the concentration of anti-T lymphocyte immunoglobulin in milligrams per millilitre which mediates 50 per cent cytotoxicity.

Lymphocyte separation medium. Commercial separation media with low viscosity and a density of 1.077 g/ml.

Complement. Commercial complement is suitable.

Buffered salt solution pH 7.2. Dissolve 8.0 g of *sodium chloride R*, 0.2 g of *potassium chloride R*, 3.18 g of *disodium hydrogen phosphate R* and 0.2 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent.

Buffer solution for flow cytometry. Add 40 ml of 0.1 per cent V/V *sodium azide R* and 10 ml of foetal calf serum to 440 ml of buffered salt solution pH 7.2. The foetal calf serum is inactivated at 56 °C for 30 min prior to use. Store at 4 °C.

Propidium iodide solution. Dissolve *propidium iodide R* in buffered salt solution pH 7.2, to a concentration of 1 mg/ml. Store this stock solution at 2-8 °C and use within 1 month. For the assay, dilute this solution with buffer solution for flow cytometry, to obtain a concentration of 5 µg/ml. Store at 2-8 °C and use within 3 h.

Microtitre plates. Plates used to prepare immunoglobulin dilutions are U- or V-bottomed polystyrene or poly(vinyl chloride) plates without surface treatment.

Micronic tubes. Suitable for flow cytometry measurement.

Cell suspension. Collect blood in anticoagulant from at least one healthy donor. Immediately isolate the peripheral blood mononuclear cells (PBMC) by gradient centrifugation in lymphocyte separation medium so that the PBMC form a visible clean interface between the plasma and the separation medium. Collect the layer containing the cells and dispense into centrifuge tubes containing buffered salt solution pH 7.2. Centrifuge at 400 *g* at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Repeat the centrifugation and resuspension procedure of the cells twice. After the third centrifugation, resuspend the cell pellet in 1 ml of buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to 7×10^6 /ml by adding buffer solution for flow cytometry. Store the cell suspension at 4 °C and use within 12 h.

If necessary, the first PBMC pellet may be resuspended in buffered salt solution pH 7.2 containing 20 per cent foetal calf serum and stored overnight at 2 °C. Centrifuge at 400 *g* at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to 7×10^6 /ml by adding buffer solution for flow cytometry.

It is also possible for cells to be immediately frozen and stored in nitrogen using the following method.

Buffer solution for freezing. To 20 ml of cell culture medium, add 25 ml of foetal calf serum and 5 ml of dimethyl sulphoxide (DMSO). Store this solution at 2-8 °C and use within 3 h.

20×10^6 cells per ampoule are frozen. These ampoules are stored in liquid nitrogen.

Buffer solution for thawing. To 450 ml of cell culture medium, add 50 ml of foetal calf serum. Store this solution at 2-8 °C and use within 3 h.

Each ampoule is thawed in a water-bath at 37 °C with shaking. Cell suspension is repeated in a buffer solution for thawing. Centrifuge at 200 *g* at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Repeat the procedure for centrifugation and resuspension of cells once. After the second centrifugation, resuspend the cells pellet in 1 ml of buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent

is required. Adjust the cell number to 7×10^6 /ml by adding buffer solution for flow cytometry. Store the cell suspension at 4 °C and use within 3 h.

Test solutions. For freeze-dried preparations, reconstitute as stated on the label. Prepare 3 independent series of not fewer than 7 dilutions using buffer solution for flow cytometry as diluent.

Reference solutions. For freeze-dried preparations, reconstitute according to the instructions for use. Prepare 3 independent dilution series of not fewer than 7 dilutions using buffer solution for flow cytometry as diluent.

Distribute 75 µl of each of the dilutions of the test solution or reference solution to each of a series of wells of a microtitre plate. Add 25 µl of the cell suspension of PBMC into each well. Add 25 µl of rabbit complement to each of the wells. Incubate at 37 °C for 30 min.

Centrifuge the plates at 200 *g* at 4 °C for 8 min, discard the supernatant and keep the plate on ice. Preparation for flow cytometry measurement is done step-wise by using a certain number of wells in order to allow labelling with *propidium iodide R* solution and measurement within a defined time period. Resuspend carefully the cell pellet of a certain number of wells with 200 µl of propidium iodide solution. Transfer the suspension into tubes. Incubate at 25 °C for 10 min then place immediately on ice.

Proceed with fluorescence measurement in a flow cytometer. Define a region including all propidium iodide-positive cells on the basis of Forward-Scattered, light (FSC) and fluorescence (FL2 or FL3 for propidium iodide). Measure the percentage of propidium iodide-positive cells, without gating but excluding debris. Analyse at least 3000 cells for each of the test and reference solutions.

Use the percentages of dead cells to estimate the potency as the concentration in milligrams per millilitre of the preparation to be examined necessary to induce 50 per cent of cytotoxicity by fitting a sigmoidal dose response curve to the data obtained with the test and the reference preparations and by using a 4-parameter logistic model (see, for example, chapter 5.3) and suitable software. The test is not valid unless the percentage of propidium iodide-positive cells at the lower asymptote of the curve is less than 15 per cent and the percentage of propidium iodide-positive cells at the upper asymptote of the curve is at least 80 per cent.

The estimated activity is 70 per cent to 130 per cent of the activity approved for the particular product.

The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

Protected from light at the temperature stated on the label.

Expiry date. The expiry date is calculated from the beginning of the assay.

LABELLING

The label states:

- for liquid preparations, the volume of the preparation in the container and the protein content,
- for freeze-dried preparations:
 - the name and the volume of the reconstitution liquid to be added,
 - the quantity of protein in the container,
 - that the immunosera are to be used immediately after reconstitution,
 - the time required for complete dissolution,
- the animal species of origin,

- the name and amount of stabiliser, where applicable,
- the dilution to be made before use of the product.

01/2005:0136

APOMORPHINE HYDROCHLORIDE

Apomorphini hydrochloridum

 $C_{17}H_{18}ClNO_2 \cdot 1/2 H_2O$ M_r 312.8

DEFINITION

(6a*R*)-6-Methyl-5,6,6a,7-tetrahydro-4*H*-dibenzo[*de*, *g*]quinoline-10,11-diol hydrochloride hemihydrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellowish-brown or green-tinged greyish, crystalline powder or crystals; on exposure to air and light, the green tinge becomes more pronounced.

Solubility: sparingly soluble in water and in alcohol, practically insoluble in toluene.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 10.0 mg in 0.1 *M* hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with 0.1 *M* hydrochloric acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 273 nm and a shoulder at 300 nm to 310 nm. The specific absorbance at the maximum is 530 to 570.
- B. Infrared absorption spectrophotometry (2.2.24).
Comparison: Ph. Eur. reference spectrum of apomorphine hydrochloride.
- C. To 5 ml of solution S (see Tests) add a few millilitres of sodium hydrogen carbonate solution *R* until a permanent, white precipitate is formed. The precipitate slowly becomes greenish. Add 0.25 ml of 0.05 *M* iodine and shake. The precipitate becomes greyish-green. Collect the precipitate. The precipitate dissolves in ether *R* giving a purple solution, in methylene chloride *R* giving a violet-blue solution and in alcohol *R* giving a blue solution.
- D. To 2 ml of solution S add 0.1 ml of nitric acid *R*. Mix and filter. The filtrate gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.25 g without heating in carbon dioxide-free water *R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₅ or GY₅ (2.2.2, Method II).

pH (2.2.3): 4.0 to 5.0 for solution S.

Specific optical rotation (2.2.7): –48 to –52 (dried substance).

Dissolve 0.25 g in 0.02 *M* hydrochloric acid and dilute to 25.0 ml with the same acid.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.25 g of the substance to be examined in a 1 per cent V/V solution of glacial acetic acid *R* and dilute to 100.0 ml with the same solution.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with a 1 per cent V/V solution of glacial acetic acid *R*. Dilute 1.0 ml to 100.0 ml with a 1 per cent V/V solution of glacial acetic acid *R*.

Reference solution (b). Dissolve 25 mg of boldine *R* in a 1 per cent V/V solution of glacial acetic acid *R* and dilute to 10.0 ml with the same solvent. To 1 ml of this solution, add 1 ml of the test solution and dilute to 10.0 ml with a 1 per cent V/V solution of glacial acetic acid *R*.

Column:

- *size*: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography *R* (5 μ m),
- *temperature*: 35 °C.

Mobile phase:

- *mobile phase A*: 1.1 g/l solution of sodium octanesulphonate *R*, adjusted to pH 2.2 using a 50 per cent *m/m* solution of phosphoric acid *R*,
- *mobile phase B*: acetonitrile *R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 30	85 → 68	15 → 32
30 - 35	68	32
35 - 45	68 → 85	32 → 15

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 10 μ l.

System suitability: reference solution (b):

- *resolution*: minimum 2.5 between the peaks due to boldine and apomorphine.

Limits:

- *any impurity*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *total*: not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent),
- *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) *R*.

Loss on drying (2.2.32): 2.5 per cent to 4.2 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 ml of 0.01 *M* hydrochloric acid and 50 ml of alcohol *R*. Carry out a potentiometric titration (2.2.20), using 0.1 *M* sodium hydroxide. Read the volume added between the first 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 30.38 mg of $C_{17}H_{18}ClNO_2$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. (6aR)-10-methoxy-6-methyl-5,6,6a,7-tetrahydro-4H-dibenzo[de,g]quinolin-11-ol (apocodeine),

B. morphine.

01/2005:0580

APROTININ

Aprotininum

DEFINITION

Aprotinin is a polypeptide consisting of a chain of 58 amino acids. It inhibits stoichiometrically the activity of several proteolytic enzymes such as chymotrypsin, kallikrein, plasmin and trypsin. It contains not less than 3.0 Ph. Eur. U. of aprotinin activity per milligram, calculated with reference to the dried substance.

PRODUCTION

The animals from which aprotinin is derived must fulfil the requirements for the health of animals suitable for human consumption to the satisfaction of the competent authority.

The manufacturing process is validated to demonstrate suitable inactivation or removal of any contamination by viruses or other infectious agents.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following tests.

Abnormal toxicity (2.6.9). Inject into each mouse a quantity of the substance to be examined containing 2 Ph. Eur. U. dissolved in a sufficient quantity of *water for injections R* to give a volume of 0.5 ml.

Histamine (2.6.10): maximum 0.2 µg of histamine base per 3 Ph. Eur. U.

CHARACTERS

Appearance: almost white powder, hygroscopic.

Solubility: soluble in water and in isotonic solutions, practically insoluble in organic solvents.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Solution S (see Tests).

Reference solution. Aprotinin solution BRP.

Plate: TLC silica gel G plate R.

Mobile phase: *water R*, *glacial acetic acid R* (80:100 V/V) containing 100 g/l of *sodium acetate R*.

Application: 10 µl.

Development: over a path of 12 cm.

Drying: in air.

Detection: spray with a solution of 0.1 g of *ninhydrin R* in a mixture of 6 ml of a 10 g/l solution of *cupric chloride R*, 21 ml of *glacial acetic acid R* and 70 ml of *ethanol R*. Dry the plate at 60 °C.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Determine the ability of the substance to be examined to inhibit trypsin activity using the method described below.

Test solution. Dilute 1 ml of solution S to 50 ml with *buffer solution pH 7.2 R*.

Trypsin solution. Dissolve 10 mg of *trypsin BRP* in 0.002 M *hydrochloric acid* and dilute to 100 ml with the same acid.

Casein solution. Dissolve 0.2 g of *casein R* in *buffer solution pH 7.2 R* and dilute to 100 ml with the same buffer solution.

Precipitating solution. Mix 1 volume of *glacial acetic acid R*, 49 volumes of *water R* and 50 volumes of *ethanol R*.

Mix 1 ml of the test solution with 1 ml of the trypsin solution. Allow to stand for 10 min and add 1 ml of the casein solution. Incubate at 35 °C for 30 min. Cool in iced water and add 0.5 ml of the precipitating solution. Shake and allow to stand at room temperature for 15 min. The solution is cloudy. Carry out a blank test under the same conditions using *buffer solution pH 7.2 R* instead of the test solution. The solution is not cloudy.

TESTS

Solution S. Prepare a solution of the substance to be examined containing 15 Ph. Eur. U./ml, calculated from the activity stated on the label.

Appearance of solution. Solution S is clear (2.2.1).

Absorbance (2.2.25): maximum 0.80 by measuring at the absorption maximum at 277 nm.

Prepare a solution of the substance to be examined containing 3.0 Ph. Eur. U./ml.

Protein impurities of higher molecular mass. Size-exclusion chromatography (2.2.30).

Use *cross-linked dextran for chromatography R2*. Use a 180 g/l solution of *anhydrous acetic acid R* to swell the gel and as the eluent. Prepare a column of gel 0.8 m to 1.0 m long and 25 mm in diameter, taking care to avoid the introduction of air bubbles. Place at the top of the column a quantity of the substance to be examined containing 300 Ph. Eur. U. dissolved in 1 ml of a 180 g/l solution of *anhydrous acetic acid R* and allow to elute. Collect the eluate in fractions of 2 ml. Measure the absorbance (2.2.25) of each fraction at the absorption maximum at 277 nm and plot the values on a graph. The chromatogram obtained does not present an absorption maximum before the elution of the aprotinin.

Loss on drying (2.2.32): maximum 6.0 per cent, determined on 0.100 g by drying *in vacuo*.

Bacterial endotoxins (2.6.14): less than 0.14 IU per European Pharmacopoeia Unit of aprotinin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The activity of aprotinin is determined by measuring its inhibitory action on a solution of trypsin of known activity. The inhibiting activity of the aprotinin is calculated from the difference between the initial activity and the residual activity of the trypsin.

The inhibiting activity of aprotinin is expressed in European Pharmacopoeia Units. 1 Ph. Eur. U. inhibits 50 per cent of the enzymatic activity of 2 microkatal of trypsin.

Use a reaction vessel with a capacity of about 30 ml and provided with:

- a device that will maintain a temperature of 25 ± 0.1 °C;
- a stirring device, such as a magnetic stirrer;
- a lid with 5 holes for accommodating the electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of the reagents.

An automatic or manual titration apparatus may be used. In the latter case the burette is graduated in 0.05 ml and the pH-meter is provided with a wide reading scale and glass and calomel electrodes.

Test solution. Prepare a solution of the substance to be examined in 0.0015 M borate buffer solution pH 8.0 R expected to contain 1.67 Ph. Eur. U./ml (about 0.6 mg (*m* mg) per millilitre).

Trypsin solution. Prepare a solution of *trypsin BRP* containing about 0.8 microkatal per millilitre (about 1 mg/ml), using 0.001 M hydrochloric acid as the solvent. Use a freshly prepared solution and keep in iced water.

Trypsin and aprotinin solution. To 4.0 ml of the trypsin solution add 1.0 ml of the test solution. Dilute immediately to 40.0 ml with 0.0015 M borate buffer solution pH 8.0 R. Allow to stand at room temperature for 10 min and then keep in iced water. Use within 6 h of preparation.

Dilute trypsin solution. Dilute 0.5 ml of the trypsin solution to 10.0 ml with 0.0015 M borate buffer solution pH 8.0 R. Allow to stand at room temperature for 10 min and then keep in iced water.

Maintain an atmosphere of nitrogen in the reaction flask and stir continuously; introduce 9.0 ml of 0.0015 M borate buffer solution pH 8.0 R and 1.0 ml of a freshly prepared 6.9 g/l solution of *benzoylarginine ethyl ester hydrochloride R*. Adjust to pH 8.0 with 0.1 M sodium hydroxide. When the temperature has reached equilibrium at 25 ± 0.1 °C, add 1.0 ml of the trypsin and aprotinin solution and start a timer. Maintain at pH 8.0 by the addition of 0.1 M sodium hydroxide and note the volume added every 30 s. Continue the reaction for 6 min. Determine the number of millilitres of 0.1 M sodium hydroxide used per second (n_1 ml). Carry out, under the same conditions, a titration using 1.0 ml of the dilute trypsin solution. Determine the number of millilitres of 0.1 M sodium hydroxide used per second (n_2 ml).

Calculate the aprotinin activity in European Pharmacopoeia Units per milligram from the expression:

$$\frac{4000 (2n_2 - n_1)}{m}$$

The estimated activity is not less than 90 per cent and not more than 110 per cent of the activity stated on the label.

STORAGE

In an airtight, tamper-proof container, protected from light.

LABELLING

The label states:

- the number of European Pharmacopoeia Units of aprotinin activity per milligram,

- where applicable, that the substance is free from bacterial endotoxins.

01/2005:0579

APROTININ CONCENTRATED SOLUTION

Aprotinini solutio concentrata

DEFINITION

Aprotinin concentrated solution is a solution of aprotinin, a polypeptide consisting of a chain of 58 amino acids, which inhibits stoichiometrically the activity of several proteolytic enzymes such as chymotrypsin, kallikrein, plasmin and trypsin. It contains not less than 15.0 Ph. Eur. U. of aprotinin activity per millilitre.

PRODUCTION

The animals from which aprotinin is derived must fulfil the requirements for the health of animals suitable for human consumption to the satisfaction of the competent authority. The manufacturing process is validated to demonstrate suitable inactivation or removal of any contamination by viruses or other infectious agents.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following tests.

Abnormal toxicity (2.6.9). Inject into each mouse a quantity of the preparation to be examined containing 2 Ph. Eur. U. diluted with a sufficient quantity of *water for injections R* to give a volume of 0.5 ml.

Histamine (2.6.10): maximum 0.2 µg of histamine base per 3 Ph. Eur. U.

CHARACTERS

Appearance: clear and colourless liquid.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Solution S (see Tests).

Reference solution. Aprotinin solution BRP.

Plate: TLC silica gel G plate R.

Mobile phase: *water R*, *glacial acetic acid R* (80:100 V/V) containing 100 g/l of *sodium acetate R*.

Application: 10 µl.

Development: over a path of 12 cm.

Drying: in air.

Detection: spray with a solution of 0.1 g of *ninhydrin R* in a mixture of 6 ml of a 10 g/l solution of *cupric chloride R*, 21 ml of *glacial acetic acid R* and 70 ml of *ethanol R*. Dry the plate at 60 °C.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Determine the ability of the preparation to be examined to inhibit trypsin activity using the method described below.

Test solution. Dilute 1 ml of solution S to 50 ml with *buffer solution pH 7.2 R*.

Trypsin solution. Dissolve 10 mg of *trypsin BRP* in 0.002 M hydrochloric acid and dilute to 100 ml with the same acid.

Casein solution. Dissolve 0.2 g of *casein R* in *buffer solution pH 7.2 R* and dilute to 100 ml with the same buffer solution.

Precipitating solution. Mix 1 volume of *glacial acetic acid R*, 49 volumes of *water R* and 50 volumes of *ethanol R*.

Mix 1 ml of the test solution with 1 ml of the trypsin solution. Allow to stand for 10 min and add 1 ml of the casein solution. Incubate at 35 °C for 30 min. Cool in iced water and add 0.5 ml of the precipitating solution. Shake and allow to stand at room temperature for 15 min. The solution is cloudy. Carry out a blank test under the same conditions using *buffer solution pH 7.2 R* instead of the test solution. The solution is not cloudy.

TESTS

Solution S. Prepare a solution containing 15 Ph. Eur. U./ml, if necessary by dilution on the basis of the activity stated on the label.

Appearance of solution. Solution S is clear (2.2.1).

Absorbance (2.2.25): maximum 0.80 by measuring at the absorption maximum at 277 nm.

Prepare from the concentrated solution a dilution containing 3.0 Ph. Eur. U./ml.

Protein impurities of higher molecular mass. Size-exclusion chromatography (2.2.30).

Freeze-dry the preparation to be examined using a pressure of 2.7 Pa and a temperature of –30 °C; the operation, including freeze-drying and a period of drying at 15–25 °C, takes 6–12 h.

Use *cross-linked dextran for chromatography R2*. Use a 180 g/l solution of *anhydrous acetic acid R* to swell the gel and as the eluent. Prepare a column of gel 0.8 m to 1.0 m long and 25 mm in diameter, taking care to avoid the introduction of air bubbles. Place at the top of the column a quantity of the preparation to be examined containing 300 Ph. Eur. U. dissolved in 1 ml of a 180 g/l solution of *anhydrous acetic acid R* and allow to elute. Collect the eluate in fractions of 2 ml. Measure the absorbance (2.2.25) of each fraction at the absorption maximum at 277 nm and plot the values on a graph. The chromatogram obtained does not present an absorption maximum before the elution of the aprotinin.

Specific activity of the dry residue: minimum 3.0 Ph. Eur. U. of aprotinin activity per milligram of dry residue.

Evaporate 25.0 ml to dryness in a water-bath, dry the residue at 110 °C for 15 h and weigh. From the mass of the residue and the activity determined as described below, calculate the number of European Pharmacopoeia Units per milligram of dry residue.

Bacterial endotoxins (2.6.14): less than 0.14 IU per European Pharmacopoeia Unit of aprotinin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The activity of aprotinin is determined by measuring its inhibitory action on a solution of trypsin of known activity. The inhibiting activity of the aprotinin is calculated from the difference between the initial activity and the residual activity of the trypsin.

The inhibiting activity of aprotinin is expressed in European Pharmacopoeia Units. 1 Ph. Eur. U. inhibits 50 per cent of the enzymatic activity of 2 microkatal of trypsin.

Use a reaction vessel with a capacity of about 30 ml and provided with:

- a device that will maintain a temperature of 25 ± 0.1 °C;
- a stirring device, such as a magnetic stirrer;
- a lid with 5 holes for accommodating the electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of the reagents.

An automatic or manual titration apparatus may be used. In the latter case the burette is graduated in 0.05 ml and the pH-meter is provided with a wide reading scale and glass and calomel electrodes.

Test solution. With 0.0015 M borate buffer solution pH 8.0 R prepare an appropriate dilution (D) of the concentrated solution expected on the basis of the stated potency to contain 1.67 Ph. Eur. U./ml.

Trypsin solution. Prepare a solution of *trypsin BRP* containing about 0.8 microkatal per millilitre (about 1 mg/ml), using 0.001 M hydrochloric acid as the solvent. Use a freshly prepared solution and keep in iced water.

Trypsin and aprotinin solution. To 4.0 ml of the trypsin solution add 1.0 ml of the test solution. Dilute immediately to 40.0 ml with 0.0015 M borate buffer solution pH 8.0 R. Allow to stand at room temperature for 10 min and then keep in iced water. Use within 6 h of preparation.

Dilute trypsin solution. Dilute 0.5 ml of the trypsin solution to 10.0 ml with 0.0015 M borate buffer solution pH 8.0 R. Allow to stand at room temperature for 10 min and then keep in iced water.

Maintain an atmosphere of nitrogen in the reaction flask and stir continuously; introduce 9.0 ml of 0.0015 M borate buffer solution pH 8.0 R and 1.0 ml of a freshly prepared 6.9 g/l solution of *benzoylarginine ethyl ester hydrochloride R*. Adjust to pH 8.0 with 0.1 M sodium hydroxide. When the temperature has reached equilibrium at 25 ± 0.1 °C, add 1.0 ml of the trypsin and aprotinin solution and start a timer. Maintain at pH 8.0 by the addition of 0.1 M sodium hydroxide and note the volume added every 30 s. Continue the reaction for 6 min. Determine the number of millilitres of 0.1 M sodium hydroxide used per second (n_1 ml). Carry out, under the same conditions, a titration using 1.0 ml of the dilute trypsin solution. Determine the number of millilitres of 0.1 M sodium hydroxide used per second (n_2 ml).

Calculate the aprotinin activity in European Pharmacopoeia Units per millilitre from the expression:

$$4000 (2n_2 - n_1) \times D$$

D = dilution factor of the aprotinin concentrated solution to be examined in order to obtain a solution containing 1.67 Ph. Eur. U./ml.

The estimated activity is not less than 90 per cent and not more than 110 per cent of the activity stated on the label.

STORAGE

In an airtight, tamper-proof container, protected from light.

LABELLING

The label states:

- the number of European Pharmacopoeia Units of aprotinin activity per millilitre.
- where applicable, that the solution is free from bacterial endotoxins.

01/2005:1171

ARACHIS OIL, HYDROGENATED**Arachidis oleum hydrogenatum****DEFINITION**

Hydrogenated arachis oil is the product obtained by refining, bleaching, hydrogenating and deodorising oil obtained from the shelled seeds of *Arachis hypogaea* L. Each type of hydrogenated arachis oil is characterised by its nominal drop point.

CHARACTERS

A white or faintly yellowish, soft mass which melts to a clear, pale yellow liquid when heated, practically insoluble in water, freely soluble in methylene chloride and in light petroleum (bp: 65 °C to 70 °C), very slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

- A. It complies with the test for drop point (see Tests).
- B. Carry out the identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is similar to the typical chromatogram for arachis oil.
- C. It complies with the test for composition of fatty acids.

TESTS

Drop point (2.2.17): 32 °C to 43 °C. Within this range the drop point does not differ by more than 3 °C from the nominal value.

Acid value (2.5.1). Not more than 0.5. Dissolve 10.0 g in 50 ml of the prescribed solvent by heating on a water-bath.

Peroxide value (2.5.5). Not more than 5.0. Dissolve 5.0 g in 30 ml of the prescribed solvent by heating on a water-bath.

Unsaponifiable matter (2.5.7). Not more than 1.0 per cent.

Alkaline impurities (2.4.19). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (2.4.22, Method A).

The chromatographic procedure may be carried out using:

- a capillary fused-silica column 25 m long and 0.25 mm in internal diameter coated with *poly(cyanopropyl)siloxane R* (film thickness 0.2 µm),
- *helium for chromatography R* as the carrier gas at a flow rate of 0.7 ml/min,
- a flame-ionisation detector,
- a split injector (1:100),

maintaining the temperature of the column at 180 °C for 20 min and that of the injection port and of the detector at 250 °C.

The fatty acid fraction of the oil has the following composition:

- *saturated fatty acids of chain length less than C₁₄*: not more than 0.5 per cent,
- *myristic acid*: not more than 0.5 per cent,
- *palmitic acid*: 7.0 per cent to 16.0 per cent,
- *stearic acid*: 3.0 per cent to 19.0 per cent,
- *oleic acid and isomers* (C_{18:1}, equivalent chain length on *poly(cyanopropyl)siloxane 18.5 to 18.8*): 54.0 per cent to 78.0 per cent,

- *linoleic acid and isomers* (C_{18:2}, equivalent chain length on *poly(cyanopropyl)siloxane 19.4 to 19.8*): not more than 10.0 per cent,
- *arachidic acid*: 1.0 per cent to 3.0 per cent,
- *eicosenoic acids* (C_{20:1}, equivalent chain length on *poly(cyanopropyl)siloxane 20.4 to 20.7*): not more than 2.1 per cent,
- *behenic acid*: 1.0 per cent to 5.0 per cent,
- *erucic acid and isomers* (C_{22:1}, equivalent chain length on *poly(cyanopropyl)siloxane 22.4 to 22.6*): not more than 0.5 per cent,
- *lignoceric acid*: 0.5 per cent to 3.0 per cent.

Nickel. Not more than 1 ppm of Ni, determined by atomic absorption spectrometry (2.2.23, Method II).

Test solution. Into a platinum or silica crucible previously tared after ignition introduce 5.0 g. Cautiously heat and introduce into the substance a wick formed from twisted ashless filter paper. Ignite the wick. When the substance has ignited stop heating. After combustion, ignite in a muffle furnace at about 600 °C. Continue ignition until white ash is obtained. After cooling, take up the residue with two quantities, each of 2 ml, of *dilute hydrochloric acid R* and transfer into a 25 ml graduated flask. Add 0.3 ml of *nitric acid R* and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare three reference solutions by adding 1.0 ml, 2.0 ml and 4.0 ml of *nickel standard solution* (0.2 ppm Ni) *R* to 2.0 ml of the test solution and diluting to 10.0 ml with *water R*.

Measure the absorbance at 232 nm using a nickel hollow-cathode lamp as a source of radiation, a graphite furnace as an atomic generator and *argon R* as the carrier gas.

Water (2.5.12). Not more than 0.3 per cent, determined on 1.000 g by the semi-micro determination of water.

STORAGE

Store protected from light.

LABELLING

The label states the nominal drop point.

01/2005:0263

ARACHIS OIL, REFINED**Arachidis oleum raffinatum****DEFINITION**

The refined fatty oil obtained from the shelled seeds of *Arachis hypogaea* L. A suitable antioxidant may be added.

CHARACTERS

Appearance: clear, yellowish, viscous liquid.

Solubility: very slightly soluble in alcohol, miscible with light petroleum.

Relative density: about 0.915.

It solidifies at about 2 °C.

IDENTIFICATION

It complies with the identification test for fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is similar to the typical chromatogram for arachis oil.

TESTS

Acid value (2.5.1): maximum 0.5, determined on 10.0 g.

Peroxide value (2.5.5): maximum 5.0.

01/2005:0806

Unsaponifiable matter (2.5.7): maximum 1.0 per cent, determined on 5.0 g.

Alkaline impurities (2.4.19). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids. Gas chromatography (2.4.22, Method A).

Reference solution (a). Prepare 0.50 g of a mixture of the calibrating substances as indicated in Table 0263-1. Dissolve in *heptane R* and dilute to 50 ml with the same solvent.

Table 0263-1

Calibrating substances	Composition (per cent m/m)
<i>Methyl palmitate R</i>	10
<i>Methyl stearate R</i>	5
<i>Methyl oleate R</i>	40
<i>Methyl linoleate R</i>	25
<i>Methyl linolenate R</i>	2
<i>Methyl arachidate R</i>	5
<i>Methyl eicosenoate R</i>	3
<i>Methyl behenate R</i>	5
<i>Methyl erucate R</i>	2
<i>Methyl lignocerate R</i>	3

Composition of the fatty acid fraction of the oil:

- **saturated fatty acids of chain length less than C_{16} :** maximum 0.4 per cent,
- **palmitic acid:** 7.0 per cent to 16.0 per cent,
- **stearic acid:** 1.3 per cent to 6.5 per cent,
- **oleic acid** (equivalent chain length on polyethyleneglycol adipate 18.3): 35.0 per cent to 72.0 per cent,
- **linoleic acid** (equivalent chain length on polyethyleneglycol adipate 18.9): 13.0 per cent to 43.0 per cent,
- **linolenic acid** (equivalent chain length on polyethyleneglycol adipate 19.7): maximum 0.6 per cent,
- **arachidic acid:** 0.5 per cent to 3.0 per cent,
- **eicosenoic acid** (equivalent chain length on polyethyleneglycol adipate 20.3): 0.5 per cent to 2.1 per cent,
- **behenic acid:** 1.0 per cent to 5.0 per cent,
- **erucic acid** (equivalent chain length on polyethyleneglycol adipate 22.3): maximum 0.5 per cent,
- **lignoceric acid:** 0.5 per cent to 3.0 per cent.

Water (2.5.12): maximum 0.3 per cent, determined on 3.00 g, if intended for use in the manufacture of parenteral dosage forms.

STORAGE

In a well-filled container, protected from light.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- the name and concentration of any added antioxidant.

ARGININE

Argininum

 $C_6H_{14}N_4O_2$
 M_r 174.2

DEFINITION

Arginine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (S)-2-amino-5-guanidinopentanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

- It complies with the test for specific optical rotation (see Tests).
- Solution S (see Tests) is strongly alkaline (2.2.4).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *arginine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve about 25 mg in 2 ml of *water R*. Add 1 ml of α -naphthol solution R and 2 ml of a mixture of equal volumes of *strong sodium hypochlorite solution R* and water. A red colour develops.

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Specific optical rotation (2.2.7). Dissolve 2.00 g in *hydrochloric acid R1* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 25.5 to + 28.5, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *arginine CRS* in 0.1 M *hydrochloric acid* and dilute to 50 ml with the same acid.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *arginine CRS* and 10 mg of *lysine hydrochloride CRS* in 0.1 M hydrochloric acid and dilute to 25 ml with the same acid.

Apply to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 30 volumes of *concentrated ammonia R* and 70 volumes of *2-propanol R*. Dry the plate at 100 °C to 105 °C until the ammonia disappears completely. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). To 5 ml of solution S add 0.5 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). To 10 ml of solution S, add 1.7 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH₄) R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone RI*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 50 ml of *water R*. Using 0.2 ml of *methyl red mixed solution R* as indicator, titrate with 0.1 M *hydrochloric acid* until the colour changes from green to violet-red.

1 ml of 0.1 M *hydrochloric acid* is equivalent to 17.42 mg of C₁₀H₂₁N₅O₆.

STORAGE

Store protected from light.

DEFINITION

(2S)-2-Amino-5-guanidinopentanoic acid (2S)-2-aminobutanedioate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white granules or powder.

Solubility: very soluble in water, practically insoluble in alcohol and in methylene chloride.

IDENTIFICATION

A. It complies with the test for specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *arginine aspartate CRS*.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances.

Results: the 2 principal spots in the chromatogram obtained with test solution (b) are similar in position, colour and size to the 2 principal spots in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

pH (2.2.3): 6.0 to 7.0 for solution S.

Specific optical rotation (2.2.7): + 25 to + 27 (dried substance).

Dissolve 2.50 g in *dilute hydrochloric acid R* and dilute to 25.0 ml with the same acid.

Ninhydrin-positive substances. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.20 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *water R*.

Reference solution (a). Dissolve 25 mg of *arginine R* and 25 mg of *aspartic acid R* in *water R* and dilute to 25 ml with the same solvent.

Reference solution (b). Dilute 2 ml of reference solution (a) to 50 ml with *water R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *ammonia R, propanol R* (36:64 V/V).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: at 100-105 °C for 10 min.

Detection: spray with *ninhydrin solution R* and heat at 100-105 °C for 10 min.

System suitability: reference solution (b):

— the chromatogram shows 2 clearly separated principal spots.

Limit: test solution (a):

— *any impurity:* any spots, apart from the 2 principal spots, are not more intense than each of the 2 principal spots in the chromatogram obtained with reference solution (b) (0.2 per cent).

Chlorides (2.4.4): maximum 200 ppm.

Dilute 2.5 ml of solution S to 15 ml with *water R*.

01/2005:2096

ARGININE ASPARTATE

Arginini aspartas

C₁₀H₂₁N₅O₆

M_r 307.3

Sulphates (2.4.13): maximum 300 ppm.

To 0.5 g add 2.5 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. Examine after 30 min.

Ammonium (2.4.1): maximum 100 ppm, determined on 100 mg.

Heavy metals (2.4.8): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 60 °C for 24 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 80.0 mg in 2 ml of *anhydrous formic acid R*. Add 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 10.24 mg of $C_{10}H_{21}N_5O_6$.

01/2005:0805

ARGININE HYDROCHLORIDE

Arginini hydrochloridum

 $C_6H_{15}ClN_4O_2$
 M_r 210.7

DEFINITION

Arginine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of the hydrochloride of (S)-2-amino-5-guanidinopentanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *arginine hydrochloride CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve about 25 mg in 2 ml of *water R*. Add 1 ml of α -naphthol solution *R* and 2 ml of a mixture of equal volumes of *strong sodium hypochlorite solution R* and *water R*. A red colour develops.
- About 20 mg gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 2.00 g in *hydrochloric acid R1* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 21.0 to + 23.5, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *arginine hydrochloride CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *arginine hydrochloride CRS* and 10 mg of *lysine hydrochloride CRS* in *water R* and dilute to 25 ml with the same solvent.

Apply to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 30 volumes of *concentrated ammonia R* and 70 volumes of *2-propanol R*. Dry the plate at 100 °C to 105 °C until the ammonia disappears completely. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Sulphates (2.4.13). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH₄) R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Using 0.1 ml of *naphtholbenzein solution R* as indicator, titrate with 0.1 M *perchloric acid* until the colour changes from brownish-yellow to green.

1 ml of 0.1 M perchloric acid is equivalent to 21.07 mg of $C_6H_{15}ClN_4O_2$.

STORAGE

Store protected from light.

01/2005:1391

ARNICA FLOWER

Arnicae flos

DEFINITION

Arnica flower consists of the whole or partially broken, dried flower-heads of *Arnica montana* L. It contains not less than 0.40 per cent *m/m* of total sesquiterpene lactones expressed as dihydrohelenalin tiglate, calculated with reference to the dried drug.

CHARACTERS

It has an aromatic odour.

The capitulum when spread out, is about 20 mm in diameter and about 15 mm deep, and has a peduncle of 2 cm to 3 cm in length. The involucre consists of eighteen to twenty-four elongated lanceolate bracts, with acute apices, arranged in one or two rows: the bracts, 8 mm to about 10 mm long, are green with yellowish-green external hairs visible under a lens. The receptacle, about 6 mm in diameter, is convex, alveolate and covered with hairs. Its periphery bears about twenty ligulate florets 20 mm to 30 mm long; the disc bears a greater number of tubular florets about 15 mm long. The ovary, 4 mm to 8 mm long, is crowned by a pappus of whitish bristles 4 mm to 8 mm long. Some brown achenes, crowned or not by a pappus, may be present.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The involucre consists of elongated oval bracts with acute apices; the margin is ciliated. The ligulate floret has a reduced calyx crowned by fine, shiny, whitish bristles, bearing small coarse trichomes. The orange-yellow corolla bears seven to ten parallel veins and ends in three small lobes. The stamens, with free anthers, are incompletely developed. The narrow, brown ovary bears a stigma divided into two branches curving outwards. The tubular floret is actinomorphic. The ovary and the calyx are similar to those of the ligulate floret. The short corolla has five reflexed triangular lobes; the five fertile stamens are fused at the anthers.
- B. Separate the capitulum into its different parts. Reduce to a powder (355). Examine under a microscope using chloral hydrate solution R. The powder shows the following characteristics. The epidermises of the bracts of the involucre have stomata and trichomes, which are more abundant on the outer (abaxial) surface. There are several different types of trichomes: uniseriate multicellular covering trichomes, varying in length from 50 µm to 500 µm, particularly abundant on the margins of the bract; secretory trichomes with uni- or biseriate multicellular stalks and with multicellular, globular heads, about 300 µm long, abundant on the outer surface of the bract; secretory trichomes with uniseriate multicellular stalks and with multicellular, globular heads, about 80 µm long, abundant on the inner surface of the bract. The epidermis of the ligulate corolla consists

of lobed or elongated cells, a few stomata and trichomes of different types: covering trichomes, with very sharp ends, whose length may exceed 500 µm, consisting of one to three proximal cells with thickened walls and two to four distal cells with thin walls; secretory trichomes with biseriate multicellular heads; secretory trichomes with multicellular stalks and multicellular globular heads. The ligule ends in rounded papillose cells. The epidermis of the ovary is covered with trichomes: secretory trichomes with short stalks and multicellular globular heads; twinned covering trichomes usually consisting of two longitudinally united cells, with common punctuated walls; their ends are sharp and sometimes bifid. The epidermises of the calyx consist of elongated cells bearing short, unicellular, covering trichomes pointing towards the upper end of the bristle. The pollen grains have a diameter of about 30 µm and are rounded, with a spiny exine; they have three germinal pores.

- C. Examine the chromatograms obtained in the test for *Calendula officinalis* L. - *Heterotheca inuloides*. The chromatogram obtained with the test solution shows, in the middle, a fluorescent blue zone corresponding to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution; it shows, above this zone, three fluorescent yellowish-brown to orange-yellow zones, and above these three zones a fluorescent greenish-yellow zone corresponding to astragalin. The zone located below the astragalin zone corresponds to isoquercitroside; the zone located just below this zone corresponds to luteolin-7-glucoside. It also shows a fluorescent greenish-blue zone below the zone due to caffeic acid in the chromatogram obtained with the reference solution.

TESTS

Foreign matter (2.8.2). Not more than 5.0 per cent.

***Calendula officinalis* L. - *Heterotheca inuloides*.** Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. To 2.00 g of the powdered drug (710) add 10 ml of *methanol R*. Heat in a water-bath at 60 °C for 5 min with shaking. Cool and filter.

Reference solution. Dissolve 2.0 mg of *caffeic acid R*, 2.0 mg of *chlorogenic acid R* and 5.0 mg of *rutin R* in *methanol R* and dilute to 30 ml with the same solvent.

Apply separately to the plate, as bands, 15 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 10 volumes of *water R*, 30 volumes of *methyl ethyl ketone R* and 50 volumes of *ethyl acetate R*. Allow the plate to dry in air for a few minutes. Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Heat for 5 min at 100 °C to 105 °C. Allow the plate to dry in air and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in the lower part an orange-yellow fluorescent zone (rutin), in the middle part a fluorescent zone due to chlorogenic acid and in the upper part a light bluish fluorescent zone (caffeic acid). The chromatogram obtained with the test solution does not show a fluorescent orange-yellow zone corresponding to rutin in the chromatogram obtained with the reference solution, nor does it show a zone below the zone corresponding to rutin.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 10.0 per cent.

ASSAY

Examine by liquid chromatography (2.2.29), using *santonin R* as the internal standard.

Internal standard solution. Dissolve immediately before use 0.010 g of *santonin R* accurately weighed in 10.0 ml of *methanol R*.

Test solution. In a 250 ml round-bottomed flask introduce 1.00 g of the powdered drug (355), add 50 ml of a mixture of equal volumes of *methanol R* and *water R* and heat under a reflux condenser in a water-bath at 50 °C to 60 °C for 30 min, shaking frequently. Allow to cool and filter through a paper filter. Add the paper filter, cut in pieces, to the residue in the round-bottomed flask, add 50 ml of a mixture of equal volumes of *methanol R* and *water R* and heat under a reflux condenser in a water-bath at 50 °C to 60 °C for 30 min, shaking frequently. Repeat this procedure twice. To the combined filtrate add 3.00 ml of the internal standard solution and evaporate to 18 ml under reduced pressure. Rinse the round-bottomed flask with *water R* and dilute, with the washings, to 20.0 ml. Transfer the solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 20 min. Elute with 200 ml of a mixture of equal volumes of *ethyl acetate R* and *methylene chloride R*. Evaporate the eluate to dryness in a 250 ml round-bottomed flask. Dissolve the residue in 10.0 ml of *methanol R* and add 10.0 ml of *water R*. Add 7.0 g of *neutral aluminium oxide R*, shake for 120 s, centrifuge (at 5000 *g* for 10 min) and filter through a paper filter. Evaporate 10.0 ml of the filtrate to dryness. Dissolve the residue in 3.0 ml of a mixture of equal volumes of *methanol R* and *water R* and filter.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (4 µm),
- as mobile phase at a flow rate of 1.2 ml/min:
Mobile phase A. Water R,
Mobile phase B. Methanol R,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 3	62	38	isocratic
3 - 20	62 → 55	38 → 45	linear gradient
20 - 30	55	45	isocratic
30 - 55	55 → 45	45 → 55	linear gradient
55 - 57	45 → 0	55 → 100	linear gradient
57 - 70	0	100	isocratic
70 - 90	62	38	isocratic

- as detector a spectrophotometer set at 225 nm,
- a 20 µl loop injector.

Calculate the percentage of total sesquiterpene lactones, expressed as dihydrohelenalin tiglate, from the expression:

$$\frac{S_{LS} \times C \times V \times 1.187 \times 100}{S_s \times m \times 1000}$$

- S_{LS} = area of all peaks corresponding to sesquiterpene lactones appearing after the santonin peak in the chromatogram obtained with the test solution,
- S_s = area of the peak corresponding to santonin in the chromatogram obtained with the test solution,

- m = mass of the drug to be examined, in grams,
- C = concentration of santonin in the internal standard solution used for the test solution, in milligrams per millilitre,
- V = volume of the internal standard solution used for the test solution, in millilitres,
- 1.187 = peak correlation factor between dihydrohelenalin tiglate and santonin.

STORAGE

Store protected from light.

ARTICAINE HYDROCHLORIDE

Articaini hydrochloridum

$C_{13}H_{21}ClN_2O_3S$

M_r 320.8

DEFINITION

Methyl 4-methyl-3-[[[(2*RS*)-2-(propylamino)propanoyl]amino]thiophene-2-carboxylate hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dissolve 50.0 mg in a 1 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of the solution to 100.0 ml with a 1 g/l solution of *hydrochloric acid R*. Examined between 200 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 272 nm. The specific absorbance at the maximum is 290 to 320.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: place dropwise 20 µl of the test solution on 300 mg discs.

Test solution. Dissolve 0.1 g in 5 ml of *water R*, add 3 ml of a saturated solution of *sodium hydrogen carbonate R* and shake twice with 2 ml of *methylene chloride R*. Combine the methylene chloride layers, dilute to 5.0 ml with *methylene chloride R* and dry over *anhydrous sodium sulphate R*.

Comparison: *articaine hydrochloride CRS*.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 20 mg of the substance to be examined in 5 ml of *alcohol R*.

Reference solution. Dissolve 20 mg of *articaine hydrochloride CRS* in 5 ml of *alcohol R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *triethylamine R*, *ethyl acetate R*, *heptane R* (10:35:65 V/V/V).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.50 g in *water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method I).

pH (2.2.3): 4.2 to 5.2.

Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *articaine impurity A CRS* and 5.0 mg of *articaine impurity E CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Add 1.0 ml of reference solution (b) to 50.0 mg of *articaine hydrochloride CRS* and dilute to 50 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 50.0 ml with the mobile phase.

Column:

- *size:* $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase:* spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 μ m) with a specific surface area of 335 m²/g and a carbon loading of 19 per cent,
- *temperature:* 45 °C.

Mobile phase: mix 25 volumes of *acetonitrile R* and 75 volumes of a solution prepared as follows: dissolve 2.02 g of *sodium heptanesulphonate R* and 4.08 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000 ml with the same solvent. Adjust to pH 2.0 with *phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 276 nm.

Injection: 10 μ l; inject the test solution and reference solutions (a), (c) and (d).

Run time: 5 times the retention time of articaine.

Relative retentions with reference to articaine (retention time = about 9.3 min): impurity B = about 0.6; impurity D = about 0.7; impurity A = about 0.8; impurity E = about 0.86; impurity F = about 0.9;

impurity G = about 1.7; impurity H = about 2.1; impurity I = about 2.6; impurity C = about 3.6; impurity J = about 4.0.

System suitability: reference solution (c):

- *resolution:* minimum 1.2 between the peaks due to impurity A and impurity E.

Limits:

- *impurity A:* not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.2 per cent),
- *any other impurity:* not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total of other impurities:* not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *disregard limit:* half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 5 ppm.

Dissolve 4.0 g in 20.0 ml of *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 5 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20) using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 32.08 mg of C₁₃H₂₁ClN₂O₃S.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

Other detectable impurities: D, E, F, G, H, I, J.

A. R = CH₃, R' = H: methyl 3-[[2-(propylamino)acetyl]amino]-4-methylthiophene-2-carboxylate (acetamidoarticaine),

B. R = H, R' = CH₃: 4-methyl-3-[[[(2RS)-2-(propylamino)propanoyl]amino]thiophene-2-carboxylic acid (articaine acid),

C. R = CH(CH₃)₂, R' = CH₃: 1-methylethyl 4-methyl-3-[[[(2RS)-2-(propylamino)propanoyl]amino]thiophene-2-carboxylate (articaine isopropyl ester),

- D. R1 = CH₂-CH₃, R2 = H, R3 = OCH₃: methyl 3-[[[(2*RS*)-2-(ethylamino)propanoyl]amino]-4-methylthiophene-2-carboxylate (ethylarticaïne),
- E. R1 = CH(CH₃)₂, R2 = H, R3 = OCH₃: methyl 4-methyl-3-[[[(2*RS*)-2-[(1-methylethyl)amino]propanoyl]amino]thiophene-2-carboxylate (isopropylarticaïne),
- F. R1 = CH₂-CH₂-CH₃, R2 = H, R3 = NH-CH₂-CH₂-CH₃: 4-methyl-*N*-propyl-3-[[[(2*RS*)-2-(propylamino)propanoyl]amino]thiophene-2-carboxamide (articaïne acid propionamide),
- G. R1 = (CH₂)₃-CH₃, R2 = H, R3 = OCH₃: methyl 3-[[[(2*RS*)-2-(butylamino)propanoyl]amino]-4-methylthiophene-2-carboxylate (butylarticaïne),
- H. R1 = R2 = CH₂-CH₂-CH₃, R3 = OCH₃: methyl 3-[[[(2*RS*)-2-(dipropylamino)propanoyl]amino]-4-methylthiophene-2-carboxylate (dipropylarticaïne),

- I. methyl 3-amino-4-methylthiophene-2-carboxylate (3-aminoarticaïne),

- J. methyl 3-[[[(2*RS*)-2-bromopropanoyl]amino]-4-methylthiophene-2-carboxylate (bromo compound).

01/2005:0253

ASCORBIC ACID

Acidum ascorbicum

C₆H₈O₆M_r 176.1

DEFINITION

Ascorbic acid contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of (5*R*)-5-[(1*S*)-1,2-dihydroxyethyl]-3,4-dihydroxyfuran-2(5*H*)-one.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, becoming discoloured on exposure to air and moisture, freely soluble in water, soluble in alcohol.

It melts at about 190 °C, with decomposition.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

- A. Dissolve 0.10 g in *water R* and dilute immediately to 100.0 ml with the same solvent. To 10 ml of 0.1 *M hydrochloric acid*, add 1.0 ml of the solution and dilute to 100.0 ml with *water R*. Measure the absorbance (2.2.25) at the maximum at 243 nm immediately after dissolution. The specific absorbance at the maximum is 545 to 585.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ascorbic acid CRS*. Examine the substance prepared as discs containing 1 mg.
- C. The pH (2.2.3) of solution S (see Tests) is 2.1 to 2.6.
- D. To 1 ml of solution S add 0.2 ml of *dilute nitric acid R* and 0.2 ml of *silver nitrate solution R2*. A grey precipitate is formed.

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 2.50 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 20.5 to + 21.5.

Oxalic acid. Dissolve 0.25 g in 5 ml of *water R*. Neutralise to *red litmus paper R* using *dilute sodium hydroxide solution R* and add 1 ml of *dilute acetic acid R* and 0.5 ml of *calcium chloride solution R* (test solution). Prepare a reference solution as follows: dissolve 70 mg of *oxalic acid R* in *water R* and dilute to 500 ml with the same solvent; to 5 ml of this solution add 1 ml of *dilute acetic acid R* and 0.5 ml of *calcium chloride solution R* (reference solution). Allow the solutions to stand for 1 h. Any opalescence in the test solution is not more intense than that in the reference solution (0.2 per cent).

Copper. Not more than 5 ppm of Cu, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 2.0 g of the substance to be examined in 0.1 *M nitric acid* and dilute to 25.0 ml with the same acid.

Reference solutions. Prepare reference solutions containing 0.2 ppm, 0.4 ppm and 0.6 ppm of Cu by diluting *copper standard solution* (10 ppm Cu) *R* with 0.1 *M nitric acid*.

Measure the absorbance at 324.8 nm using a copper hollow-cathode lamp as a source of radiation and an air-acetylene flame. Adjust the zero of the apparatus using 0.1 *M nitric acid*.

Iron. Not more than 2 ppm of Fe, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 5.0 g of the substance to be examined in 0.1 *M nitric acid* and dilute to 25.0 ml with the same acid.

Reference solutions. Prepare reference solutions containing 0.2 ppm, 0.4 ppm and 0.6 ppm of Fe by diluting *iron standard solution* (20 ppm Fe) *R* with 0.1 *M nitric acid*.

Measure the absorbance at 248.3 nm using an iron hollow-cathode lamp as a source of radiation and an air-acetylene flame. Adjust the zero of the apparatus using 0.1 *M nitric acid*.

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in a mixture of 10 ml of *dilute sulphuric acid R* and 80 ml of *carbon dioxide-free water R*. Add 1 ml of *starch solution R*. Titrate with 0.05 M *iodine* until a persistent violet-blue colour is obtained.

1 ml of 0.05 M *iodine* is equivalent to 8.81 mg of $C_{6}H_8O_6$.

STORAGE

Store in a non-metallic container, protected from light.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.160 g in 50 ml of *methanol R*. Add 30 ml of *water R* and 1 ml of *starch solution R*. Titrate with 0.05 M *iodine* until a persistent violet-blue colour is obtained.

1 ml of 0.05 M *iodine* is equivalent to 20.73 mg of $C_{22}H_{38}O_7$.

STORAGE

Store in an airtight container, protected from light, at a temperature of 8 °C to 15 °C.

01/2005:1600

01/2005:0807

ASCORBYL PALMITATE

Ascorbylis palmitas

$C_{22}H_{38}O_7$

M_r 414.5

DEFINITION

Ascorbyl palmitate contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of (2S)-2-[(5R)-3,4-dihydroxy-5-oxo-2,5-dihydrofuran-2-yl]-2-hydroxyethyl hexadecanoate, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, practically insoluble in water, freely soluble in alcohol and in methanol, practically insoluble in methylene chloride and in fatty oils.

IDENTIFICATION

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of ascorbyl palmitate*.
- Dissolve about 10 mg in 5 ml of *methanol R*. The solution decolourises *dichlorophenolindophenol standard solution R*.

TESTS

Solution S. Dissolve 2.50 g in *methanol R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₄ (2.2.2, *Method I*).

Specific optical rotation (2.2.7): + 21 to + 24, determined on solution S and calculated with reference to the dried substance.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 5 h.

ASH LEAF

Fraxini folium

DEFINITION

Dried leaf of *Fraxinus excelsior* L. or *Fraxinus oxyphylla* M. Bieb.

Content: minimum 2.5 per cent of total hydroxycinnamic acid derivatives expressed as chlorogenic acid ($C_{16}H_{18}O_9$; M_r 354.3) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- The leaf consists of leaflets which are sometimes detached and separated from the rachis. The leaflet is about 6 cm long and 3 cm wide. Each leaflet is subsessile or shortly petiolate, oblong, lanceolate, somewhat unequal at the base, acuminate at the apex, with fine acute teeth on the margins, the upper surface is dark green and the lower surface is greyish-green. The midrib and secondary veins are whitish and prominent on the lower surface.
- Reduce to a powder (355). The powder is greyish-green. Examined under a microscope, using *chloral hydrate solution R*. The powder shows fragments of the lamina in surface view, with the lower epidermis showing numerous anomocytic stomata (2.8.3.) and some of the cells of the upper epidermis with cuticular striations; occasional uniseriate, conical covering trichomes composed of 1 or 2 cells with thick walls and a striated cuticle; rare peltate glands with a unicellular stalk and a shield-like glandular head composed of 8 radiating cells; groups of fibres and fragments of vascular tissue from the veins.
- Examine the chromatograms obtained in the test for *Fraxinus ornus* L.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
	A light blue fluorescence zone
	An intense blue fluorescent zone (acteoside)
Chlorogenic acid: a blue fluorescent zone	A blue fluorescent zone (chlorogenic acid)
Rutin: an orange fluorescent zone	An orange fluorescent zone (rutin)
Reference solution	Test solution

TESTS

01/2005:2086

Foreign matter (2.8.2): maximum 3.0 per cent of stems and 2.0 per cent of other foreign matter.

Fraxinus ornus L. Thin-layer chromatography (2.2.27).

Test solution. To 1 g of the powdered drug (355) add 20 ml of *methanol R*. Heat with shaking at 40 °C for 10 min. Filter.

Reference solution. Dissolve 5.0 mg of *rutin R* and 5.0 mg of *chlorogenic acid R* in 10 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 V/V/V).

Application: 10 µl as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a solution containing 10 g/l of *diphenylboric acid aminoethyl ester R* and 50 g/l of *macrogol 400 R* in *methanol R*. Examine in ultraviolet light at 365 nm.

Results: in the case of a substitution by *F. ornus*, the chromatogram obtained with the test solution does not show the zones of acteoside, chlorogenic acid and rutin.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100–105 °C for 2 h.

Total ash (2.4.16): maximum 12.0 per cent.

ASSAY

Test solution (a). To 0.300 g of the powdered drug (355) add 95 ml of *alcohol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Rinse the filter with 5 ml of *alcohol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 ml with *alcohol (50 per cent V/V) R*.

Test solution (b). To 1.0 ml of test solution (a) in a test tube, add 2 ml of 0.5 M *hydrochloric acid*, 2 ml of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 ml of *water R*, then add 2 ml of *dilute sodium hydroxide solution R* and dilute to 10.0 ml with *water R*; mix.

Immediately measure the absorbance (2.2.25) of test solution (b) at 525 nm, using as compensation liquid a solution prepared as follows: mix 1.0 ml of test solution (a), 2 ml of 0.5 M *hydrochloric acid* and 2 ml of *dilute sodium hydroxide solution R* and dilute to 10.0 ml with *water R*.

Calculate the percentage content of total hydroxycinnamic acid derivatives expressed as chlorogenic acid, from the expression:

$$\frac{A \times 5.3}{m}$$

taking the specific absorbance of chlorogenic acid at 525 nm to be 188.

A = absorbance at 525 nm,

m = mass of the test sample in grams.

ASPARAGINE MONOHYDRATE

Asparaginum monohydricum

C₄H₈N₂O₃·H₂O*M_r* 150.1

DEFINITION

(2*S*)-2,4-Diamino-4-oxobutanoic acid monohydrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.

Solubility: slightly soluble in water, practically insoluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. It complies with the test for specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *asparagine monohydrate CRS*.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (c).

TESTS

Solution S. Dissolve with heating 2.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3): 4.0 to 6.0 for solution S.

Specific optical rotation (2.2.7): + 33.7 to + 36.0 (dried substance).

Dissolve 2.50 g in a 309.0 g/l solution of *hydrochloric acid R* and dilute to 25.0 ml with the same acid.

Ninhydrin-positive substances. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.25 g of the substance to be examined in *water R*, heating to not more than 40 °C, and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *water R*.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 200 ml with *water R*.

Reference solution (b). Dissolve 25 mg of *glutamic acid R* in *water R*, add 1 ml of test solution (a) and dilute to 10 ml with *water R*.

Reference solution (c). Dissolve 25 mg of *asparagine monohydrate CRS* in *water R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel *G* plate *R*.

Mobile phase: *glacial acetic acid R*, *water R*, *butanol R* (25:25:50 V/V/V).

Application: 5 µl.

Development: over half of the plate.

Drying: at 110 °C for 15 min.

Detection: spray with *ninhydrin solution R* and heat at 110 °C for 10 min.

System suitability: reference solution (b):

- the chromatogram shows 2 clearly separated principal spots.

Limit: test solution (a):

- *any impurity:* any spot, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Chlorides (2.4.4): maximum 200 ppm.

Dilute 12.5 ml of solution S to 15 ml with *water R*.

Sulphates (2.4.13): maximum 200 ppm.

To 0.75 g add 2.5 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. Examine after 30 min.

Ammonium (2.4.1, *Method B*): maximum 0.1 per cent, determined on 10 mg.

Iron (2.4.9): maximum 10 ppm.

Dissolve 1.0 g in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid. Shake 3 times with 10 ml of *methyl isobutyl ketone R1* for 3 min. Wash the combined organic phases with 10 ml of *water R* for 3 min. The aqueous phase complies with the limit test for iron.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in a mixture of 3 ml of *dilute hydrochloric acid R* and 15 ml of *water R* with gentle warming if necessary. Dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): 10.5 per cent to 12.5 per cent, determined on 1.000 g by drying in an oven at 60 °C for 24 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.110 g in 5 ml of *anhydrous formic acid R*. Add 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 13.21 mg of C₁₄H₁₈N₂O₅.

IMPURITIES

Specified impurities: A, B.

A. aspartic acid,

B. glutamic acid.

ASPARTAME

Aspartamum

C₁₄H₁₈N₂O₅

M_r 294.3

DEFINITION

Aspartame contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (3*S*)-3-amino-4-[[[(1*S*)-1-benzyl-2-methoxy-2-oxoethyl]amino]-4-oxobutanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, slightly hygroscopic, sparingly soluble or slightly soluble in water and in alcohol, practically insoluble in hexane and in methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Dissolve 0.1 g in *alcohol R* and dilute to 100 ml with the same solvent. Examined between 230 nm and 300 nm (2.2.25), the solution shows absorption maxima at 247 nm, 252 nm, 258 nm and 264 nm.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *aspartame CRS*. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 15 mg of the substance to be examined in 2.5 ml of *water R* and dilute to 10 ml with *acetic acid R*.

Reference solution. Dissolve 15 mg of *aspartame CRS* in 2.5 ml of *water R* and dilute to 10 ml with *acetic acid R*.

Apply to the plate 20 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *water R*, 4 volumes of *anhydrous formic acid R*, 30 volumes of *methanol R* and 64 volumes of *methylene chloride R*. Allow the plate to dry in air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. The spot in the chromatogram obtained with the test solution is similar in position, colour and size to the spot in the chromatogram obtained with the reference solution.

D. Dissolve about 20 mg in 5 ml of *methanol R* and add 1 ml of *alkaline hydroxylamine solution R1*. Heat on a water-bath for 15 min. Allow to cool and adjust to about pH 2 with *dilute hydrochloric acid R*. Add 0.1 ml of *ferric chloride solution R1*. A brownish-red colour is produced.

TESTS

Solution S. Dissolve 0.8 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY₆ (2.2.2, *Method II*).

Conductivity (2.2.38). Not more than $30 \mu\text{S cm}^{-1}$. Dissolve 0.80 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent. Measure the conductivity of the solution (C_1) and that of the water used for preparing the solution (C_2). The readings must be stable within 1 per cent over a period of 30 s. Calculate the conductivity of the solution of the substance to be examined from the expression:

$$C_1 - 0.992 C_2$$

Specific optical rotation (2.2.7). Dissolve 2.00 g in a 690 g/l solution of *anhydrous formic acid R* and dilute to 50.0 ml with the same solution. The specific optical rotation is + 14.5 to + 16.5, measured within 30 min of preparation of the solution and calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.60 g of the substance to be examined in a mixture of 1.5 volumes of *glacial acetic acid R* and 98.5 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 4.5 mg of *aspartame impurity A CRS* in a mixture of 1.5 volumes of *glacial acetic acid R* and 98.5 volumes of *water R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (b). Dissolve 30.0 mg of *phenylalanine R* in a mixture of 15 volumes of *glacial acetic acid R* and 85 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 10.0 ml with *water R*.

Reference solution (c). Dilute 5.0 ml of the test solution to 10.0 ml with *water R*. Dilute 3.0 ml of the solution to 100.0 ml with *water R*.

Reference solution (d). Dissolve 30.0 mg of *L-aspartyl-L-phenylalanine R* in a mixture of 15 volumes of *glacial acetic acid R* and 85 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 10.0 ml with *water R*. Mix 1.0 ml of this solution with 1.0 ml of reference solution (b).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* ($5 \mu\text{m}$ to $10 \mu\text{m}$),
- as mobile phase at a flow rate of 1 ml/min a mixture of 10 volumes of *acetonitrile R* and 90 volumes of a 6.8 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.7 with *phosphoric acid R*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 μl of reference solution (c). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is not less than 50 per cent of the full scale of the recorder. Inject 20 μl of reference solution (d). The test is not valid unless in the chromatogram obtained, the resolution between the peaks due to phenylalanine and *L-aspartyl-L-phenylalanine* is at least 3.5. Inject separately 20 μl of each solution. Continue the chromatography for twice the retention time of aspartame. In the chromatogram obtained with the test solution: the area of any peak corresponding to aspartame impurity A is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent); the area of any peak corresponding to phenylalanine is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of any other peaks, apart from the principal peak,

is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.5 per cent). Disregard any peak due to the solvent.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 4.5 per cent, determined on 1.000 g by drying in an oven at 100°C to 105°C .

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 1.5 ml of *anhydrous formic acid R* and 60 ml of *anhydrous acetic acid R*. Titrate immediately with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 29.43 mg of $\text{C}_{14}\text{H}_{18}\text{N}_2\text{O}_5$.

STORAGE

Store in an airtight container.

IMPURITIES

- 2-(5-benzyl-3,6-dioxopiperazin-2-yl)acetic acid (diketopiperazine),
- L*-aspartyl-*L*-phenylalanine,
- phenylalanine.

01/2005:0797

ASPARTIC ACID

Acidum asparticum

$\text{C}_4\text{H}_7\text{NO}_4$

M_r 133.1

DEFINITION

Aspartic acid contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of (2*S*)-2-aminobutanedioic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, slightly soluble in water, practically insoluble in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

- It complies with the test for specific optical rotation (see Tests).
- A suspension of 1 g in 10 ml of *water R* is strongly acid (2.2.4).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *aspartic acid CRS*. Examine the substances prepared as discs.

D. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. Dissolve 0.5 g in 1 M hydrochloric acid and dilute to 10 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Specific optical rotation (2.2.7). Dissolve 2.000 g in hydrochloric acid R1 and dilute to 25.0 ml with the same acid. The specific optical rotation is + 24.0 to + 26.0, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel plate R.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 2 ml of ammonia R and dilute to 10 ml with water R.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with water R.

Reference solution (a). Dissolve 10 mg of aspartic acid CRS in 2 ml of dilute ammonia R1 and dilute to 50 ml with water R.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with water R.

Reference solution (c). Dissolve 10 mg of aspartic acid CRS and 10 mg of glutamic acid CRS in 2 ml of dilute ammonia R1 and dilute to 25 ml with water R.

Apply separately to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of glacial acetic acid R, 20 volumes of water R and 60 volumes of butanol R. Allow the plate to dry in air, spray with ninhydrin solution R. Heat at 100-105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated principal spots.

Chlorides (2.4.4). Dissolve 0.25 g in 3 ml of dilute nitric acid R and dilute to 15 ml with water R. The solution, to which 1 ml of water R is added instead of dilute nitric acid R, complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dissolve 0.5 g in 4 ml of hydrochloric acid R and dilute to 15 ml with distilled water R. The solution complies with the limit test for sulphates (300 ppm). Carry out the evaluation of the test after 30 min.

Ammonium. (2.4.1) 50 mg complies with limit test B (200 ppm). Prepare the standard using 0.1 ml of ammonium standard solution (100 ppm NH₄) R.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of dilute hydrochloric acid R. Shake with 3 quantities, each of 10 ml, of methyl isobutyl ketone R1, shaking for 3 min each time. To the combined organic layers add 10 ml of water R and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test D (10 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 50 ml of carbon dioxide-free water R, with slight heating if necessary. Cool and add 0.1 ml of bromothymol blue solution R1. Titrate with 0.1 M sodium hydroxide until the colour changes from yellow to blue.

1 ml of 0.1 M sodium hydroxide is equivalent to 13.31 mg of C₂₈H₃₁FN₄O.

STORAGE

Protected from light.

01/2005:1067

ASTEMIZOLE

Astemizolum

C₂₈H₃₁FN₄O

M_r 458.6

DEFINITION

Astemizole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-(4-fluorobenzyl)-N-[1-[2-(4-methoxyphenyl)ethyl]piperidin-4-yl]-1H-benzimidazol-2-amine, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in methylene chloride and in methanol, soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 175 °C to 178 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with astemizole CRS. Examine the substances prepared as discs.

C. Examine by thin layer chromatography (2.2.27), using a suitable octadecylsilyl silica gel as the coating substance. **Test solution.** Dissolve 30 mg of the substance to be examined in methanol R and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 30 mg of astemizole CRS in methanol R and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 30 mg of astemizole CRS and 30 mg of ketoconazole CRS in methanol R and dilute to 5 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of ammonium acetate solution R, 40 volumes of dioxan R and 40 volumes of methanol R. Dry the plate in a current of warm air for 15 min and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the

chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Appearance of solution. Dissolve 0.2 g in *methanol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and is not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *astemizole CRS* and 25 mg of *ketoconazole CRS* in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 20.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min, a linear gradient programme as follows:

Mobile phase A. A 17 g/l solution of *tetrabutylammonium hydrogen sulphate R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0	95	5	start gradient
15	80	20	end gradient
18	0	100	purge time
23	95	5	switch to initial equilibration
28 = 0	95	5	start of next chromatogram

- as detector a spectrophotometer set at 278 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate the initial elution composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions the retention times are: *ketoconazole*, about 8 min and *astemizole*, about 9 min. The test is not valid unless the resolution between the peaks corresponding to *ketoconazole* and *astemizole* is at least 1.5. If necessary, adjust the

final concentration of acetonitrile or the percentage of tetrabutylammonium hydrogen sulphate in the mobile phase or adjust the time programme for the linear gradient elution.

Inject separately 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak obtained with the blank and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 22.93 mg of C₂₈H₃₁N₄O.

STORAGE

Store protected from light.

IMPURITIES

A. 1-(4-fluorobenzyl)-N-(piperidin-4-yl)-1H-benzimidazol-2-amine,

B. 1-(2-fluorobenzyl)-N-[1-[2-(4-methoxyphenyl)ethyl]piperidin-4-yl]-1H-benzimidazol-2-amine,

C. 1-benzyl-N-[1-[2-(4-methoxyphenyl)ethyl]piperidin-4-yl]-1H-benzimidazol-2-amine,

- D. 1-(3-fluorobenzyl)-N-[1-[2-(4-methoxyphenyl)ethyl]piperidin-4-yl]-1H-benzimidazol-2-amine,

- E. 1-(4-fluorobenzyl)-N-[cis-1-[2-(4-methoxyphenyl)ethyl]piperidin-4-yl 1-oxide]-1H-benzimidazol-2-amine,

- F. 1-(4-fluorobenzyl)-N-[trans-1-[2-(4-methoxyphenyl)ethyl]piperidin-4-yl 1-oxide]-1H-benzimidazol-2-amine,

- G. N-[1-[2-(4-methoxyphenyl)ethyl]piperidin-4-yl]-1-[4-(1-methylethoxy)benzyl]-1H-benzimidazol-2-amine,

- H. 2-(4-methoxyphenyl)ethyl 4-[[1-(4-fluorobenzyl)-1H-benzimidazol-2-yl]amino]piperidin-1-carboxylate.

01/2005:0703

ATENOLOL

Atenololum

C₁₄H₂₂N₂O₃

M_r 266.3

DEFINITION

Atenolol contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2-[4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]acetamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, sparingly soluble in water, soluble in ethanol, slightly soluble in methylene chloride.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (2.2.14): 152 °C to 155 °C.

B. Dissolve 0.100 g in *methanol R* and dilute to 100 ml with the same solvent. Dilute 10.0 ml of this solution to 100 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 275 nm and 282 nm. The ratio of the absorbance measured at the maximum at 275 nm to that measured at the maximum at 282 nm is 1.15 to 1.20.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *atenolol CRS*.

D. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in 1 ml of *methanol R*.

Reference solution. Dissolve 10 mg of *atenolol CRS* in 1 ml of *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R1* and 99 volumes of *methanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Solution S. Dissolve 0.10 g in *water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than degree 6 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Optical rotation (2.2.7). Determined on solution S, the angle of optical rotation is + 0.10° to − 0.10°.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in 20 ml of the mobile phase and dilute to 25.0 ml with the mobile phase.

Test solution (b). Dissolve 50.0 mg of the substance to be examined in 0.1 ml of *dimethyl sulfoxide R*, if necessary applying gentle heat by placing the containing vessel in a water-bath for a few seconds, and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 50.0 mg of *atenolol for column validation CRS* in 0.1 ml of *dimethyl sulfoxide R*, if necessary applying gentle heat by placing the containing vessel in a water-bath for a few seconds, and dilute to 25.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: dissolve 1.0 g of *sodium octanesulphonate R* and 0.4 g of *tetrabutylammonium hydrogen sulphate R* in 1 litre of a mixture of 20 volumes of *tetrahydrofuran R*, 180 volumes of *methanol R* and 800 volumes of a 3.4 g/l solution of *potassium dihydrogen phosphate R*; adjust to pH 3.0 with *phosphoric acid R*,
- as detector a spectrophotometer set at 226 nm.

Equilibrate the column with the mobile phase at a flow rate of 1.0 ml/min for about 30 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (a) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (b). The resulting chromatogram is similar to that of the specimen chromatogram provided with *atenolol for column validation CRS* in that the peak due to bis-ether precedes and is separated from that due to tertiary amine which normally appears as a doublet. If necessary, adjust the concentration of sodium octanesulphonate in the mobile phase. Increasing the concentration of sodium octanesulphonate increases the retention time of the tertiary amine.

Inject separately 10 µl of test solution (a) and reference solution (a). Continue the chromatography for four times the retention time of the principal peak. In the chromatogram obtained with test solution (a): the area of any peak apart from the principal peak is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.1 times of that of the principal peak in the chromatogram obtained with reference solution (a).

If the substance to be examined is found to contain more than 0.15 per cent of bis-ether, its compliance is confirmed by repeating the chromatography using 10 µl of test solution (b).

Chlorides (2.4.4). Dissolve 50 mg in a mixture of 1 ml of *dilute nitric acid R* and 15 ml of *water R*. The solution, without further addition of *dilute nitric acid R*, complies with the limit test for chlorides (0.1 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 80 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 26.63 mg of C₁₄H₂₂N₂O₃.

IMPURITIES

A. R-H: 2-(4-hydroxyphenyl)acetamide,

B. 2-[4-[(2*RS*)-2,3-dihydroxypropoxy]phenyl]acetamide,

C. 2-[4-[(2*RS*)-oxiran-2-yl]methoxy]phenyl]acetamide,

D. 2-[4-[(2*RS*)-3-chloro-2-hydroxypropoxy]phenyl]acetamide,

E. 2,2'-[2-hydroxypropan-1,3-diylbis(oxy-4,1-phenylene)]diacetamide,

F. 2,2'-[(1-methylethyl)iminobis(2-hydroxypropan-3,1-diyoxy-4,1-phenylene)]diacetamide,

G. 2-[4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]acetic acid,

H. 2-[4-[(2*RS*)-2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]acetonitrile.

01/2005:2056

ATROPINE

Atropinum

C₁₇H₂₃NO₃

M_r 289.4

DEFINITION

(1*R*,3*r*,5*S*)-8-Methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.

Solubility: very slightly soluble in water, freely soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. Melting point (2.2.14): 115 °C to 119 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of atropine.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *atropine sulphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: concentrated ammonia *R*, water *R*, acetone *R* (3:7:90 V/V/V).

Application: 10 µl.

Development: over half of the plate.

Drying: at 100-105 °C for 15 min.

Detection: after cooling, spray with dilute potassium iodobismuthate solution *R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Place about 3 mg in a porcelain crucible and add 0.2 ml of *fuming nitric acid R*. Evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of a 30 g/l solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. It complies with the test for optical rotation (see Tests).

TESTS

Optical rotation (2.2.7): -0.70° to $+0.05^{\circ}$.

Dissolve 1.25 g in *alcohol R* and dilute to 25.0 ml with the same solvent. Measure in a 2 dm tube.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in mobile phase A and dilute to 50 ml with mobile phase A. Dilute 10 ml of the solution to 50 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 5 mg of *atropine for system suitability CRS* in mobile phase A and dilute to 25 ml with mobile phase A.

Column:

- size: $l = 0.125$ m, $\varnothing = 4$ mm,
- stationary phase: octylsilyl silica gel for chromatography *R* (4 µm).

Mobile phase:

- mobile phase A: to 606 ml of a 7.0 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.3 with 0.05 M *phosphoric acid*, add 3.5 g of *sodium dodecyl sulphate R* and 320 ml of *acetonitrile R*,
- mobile phase B: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 12	100	0
12 - 25	100 → 70	0 → 30
25 - 26	70 → 100	30 → 0
26 - 30	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 µl.

System suitability: reference solution (b):

- the chromatogram obtained is similar to the chromatogram supplied with *atropine for system suitability CRS*,
- peak-to-valley ratio: minimum 20, where H_p = height above the baseline of the peak due to impurity B and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to atropine.

Limits: locate the impurities by comparing with the chromatogram obtained with reference solution (b) and with the chromatogram supplied with *atropine for system suitability CRS*:

- impurity B: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- impurity A: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent),
- any other impurity: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- total: not more than 15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent),
- disregard limit: the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); disregard peaks due to the blank.

Loss on drying (2.2.32): maximum 0.2 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

ASSAY

Dissolve 0.250 g in 40 ml of *anhydrous acetic acid R* and heat if necessary. Allow the solution to cool. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 28.94 mg of $C_{17}H_{23}NO_3$.

STORAGE

Protected from light.

IMPURITIES

A. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl 2-phenylpropenoate (apoa tropine),

- B. (1*R*,3*r*,5*S*)-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate (noratropine),

- C. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (tropic acid),

- D. R1 = OH, R2 = H: (1*R*,3*S*,5*R*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (6-hydroxyhyoscyamine),

- E. R1 = H, R2 = OH: (1*S*,3*R*,5*S*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (7-hydroxyhyoscyamine),

- F. hyoscine,

- G. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (3*RS*)-3-hydroxy-3-phenylpropanoate (isolittorine).

01/2005:0068

ATROPINE SULPHATE

Atropini sulfas

C₃₄H₄₈N₂O₁₀S₂H₂OM_r 695

DEFINITION

Atropine sulphate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of bis[(1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate] sulphate, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder or colourless crystals, very soluble in water, freely soluble in alcohol.

It melts at about 190 °C with decomposition, determined on the substance dried at 135 °C for 15 min.

IDENTIFICATION

First identification: A, B, E.

Second identification: C, D, E, F.

- An aqueous solution shows almost no optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *atropine sulphate CRS*.
- Dissolve about 50 mg in 5 ml of *water R* and add 5 ml of *picric acid solution R*. The precipitate, washed with *water R* and dried at 100 °C to 105 °C for 2 h, melts (2.2.14) at 174 °C to 179 °C.
- To about 1 mg add 0.2 ml of *fuming nitric acid R* and evaporate to dryness in a water-bath. Dissolve the residue in 2 ml of *acetone R* and add 0.1 ml of a 30 g/l solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.
- It gives the reactions of sulphates (2.3.1).
- It gives the reaction of alkaloids (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.6 g in *carbon dioxide-free water R* and dilute to 30 ml with the same solvent. The pH of the solution is 4.5 to 6.2.

Optical rotation (2.2.7). Dissolve 2.50 g in *water R* and dilute to 25.0 ml with the same solvent. The angle of optical rotation measured in a 2 dm tube is −0.50° to +0.05°.

Foreign alkaloids and decomposition products. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *methanol R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 10 cm using a mixture of 90 volumes of *acetone R*, 7 volumes of *water R* and 3 volumes of *concentrated ammonia R*. Dry the plate at 100 °C to 105 °C for 15 min. Allow to cool and spray with *dilute potassium iodobismuthate solution R* until the spots appear. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Apoatropine. Dissolve 0.10 g in 0.01 *M hydrochloric acid* and dilute to 100.0 ml with the same acid. Determine the absorbance (2.2.25) at 245 nm. The specific absorbance is not greater than 4.0, calculated with reference to the anhydrous substance (about 0.5 per cent).

Water (2.5.12). 2.0 per cent to 4.0 per cent, determined on 0.50 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in 30 ml of *anhydrous acetic acid R*, warming if necessary. Cool the solution. Titrate with 0.1 *M perchloric acid* and determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 67.68 mg of $C_{34}H_{48}N_2O_{10}S$.

STORAGE

Store protected from light.

01/2005:1708

AZAPERONE FOR VETERINARY USE

Azaperonum ad usum veterinarium

$C_{34}H_{48}FN_3O$

M_r 327.4

DEFINITION

1-(4-Fluorophenyl)-4-[4-(pyridin-2-yl)piperazin-1-yl]butan-1-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in acetone and in methylene chloride, soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: azaperone CRS.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Dissolve 1.0 g in 25 ml of a 14 g/l solution of *tartaric acid R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *azaperone CRS* and 6.0 mg of *benperidol CRS* in *methanol R* and dilute to 200.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of the solution to 20.0 ml with *methanol R*.

Column:

- *size*: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: base-deactivated octadecylsilyl silica gel for chromatography *R* (3 μ m),
- *temperature*: 25 °C.

Mobile phase:

- *mobile phase A*: dissolve 1.4 g of *anhydrous sodium sulphate R* in 900 ml of *water R*, add 16.0 ml of 0.01 M *sulphuric acid* and dilute to 1000 ml with *water R*,
- *mobile phase B*: *methanol R*.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	95 → 20	5 → 80
15 - 20	20	80
20 - 21	20 → 95	80 → 5

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 230 nm.

Equilibration: at least 4 min with the mobile phase at the initial composition.

Injection: 10 μ l.

Relative retention with reference to azaperone (retention time = about 9 min): impurity A = about 0.9; impurity B = about 1.1; impurity C = about 1.15.

System suitability: reference solution (a):

- *resolution*: minimum 8.0 between the peaks due to azaperone and to benperidol.

Limits:

- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent),
- *total of impurities B and C*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent),
- *total*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.130 g in 70 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 16.37 mg of $C_{34}H_{48}FN_3O$.

STORAGE

Protected from light.

IMPURITIES

A. 1-(2-fluorophenyl)-4-[4-(pyridin-2-yl)piperazin-1-yl]butan-1-one,

- B. 4-[4-(pyridin-2-yl)piperazin-1-yl]-1-[4-[4-(pyridin-2-yl)piperazin-1-yl]phenyl]butan-1-one,

- C. 4-hydroxy-1-[4-[4-(pyridin-2-yl)piperazin-1-yl]phenyl]butan-1-one.

01/2005:0369

AZATHIOPRINE

Azathioprinum

C₉H₇N₇O₂SM_r 277.3

DEFINITION

Azathioprine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 6-[(1-methyl-4-nitro-1H-imidazol-5-yl)sulfanyl]-7H-purine, calculated with reference to the dried substance.

CHARACTERS

A pale-yellow powder, practically insoluble in water and in alcohol. It is soluble in dilute solutions of alkali hydroxides and sparingly soluble in dilute mineral acids.

IDENTIFICATION

- Dissolve 0.150 g in 30 ml of *dimethyl sulphoxide R* and dilute to 500.0 ml with 0.1 M *hydrochloric acid*. Dilute 25.0 ml of the solution to 1000.0 ml with 0.1 M *hydrochloric acid*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 280 nm. The specific absorbance at the maximum is 600 to 660.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *azathioprine CRS*.
- To about 20 mg add 100 ml of *water R*, heat and filter. To 5 ml of the filtrate add 1 ml of *hydrochloric acid R* and about 10 mg of *zinc powder R*. Allow to stand for 5 min. The solution becomes yellow. Filter, cool in iced water, add 0.1 ml of *sodium nitrite solution R* and 0.1 g of *sulphamic acid R* and shake until the bubbles disappear. Add 1 ml of *β-naphthol solution R*. A pale-pink precipitate is formed.

TESTS

Acidity or alkalinity. To 0.5 g add 25 ml of *carbon dioxide-free water R*, shake for 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *methyl red solution R*. Not more than 0.2 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Chloromethylnitroimidazole and mercaptopurine. Examine by thin-layer chromatography (2.2.27), using *cellulose for chromatography F₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in *dilute ammonia R1* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution (a). Dissolve 10 mg of *chloromethylnitroimidazole CRS* in *dilute ammonia R1* and dilute to 50 ml with the same solvent. Prepare immediately before use.

Reference solution (b). Dissolve 10 mg of *mercaptopurine R* in *dilute ammonia R1* and dilute to 50 ml with the same solvent. Prepare immediately before use.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using *butanol R* saturated with *dilute ammonia R1*. Dry the plate at 50 °C and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any spots corresponding to chloromethyl-nitroimidazole and mercaptopurine are not more intense than the spots in the chromatograms obtained with reference solution (a) (1.0 per cent) and reference solution (b) (1.0 per cent), respectively.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.50 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 25 ml of *dimethylformamide R*. Titrate with 0.1 M *tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 27.73 mg of C₉H₇N₇O₂S.

STORAGE

Store protected from light.

AZELASTINE HYDROCHLORIDE

Azelastini hydrochloridum

C₂₂H₂₅Cl₂N₃OM_r 418.4

DEFINITION

4-(4-Chlorobenzyl)-2-[(4*RS*)-1-methylhexahydro-1*H*-azepin-4-yl]phthalazin-1(2*H*)-one hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: sparingly soluble in water, soluble in ethanol and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: azelastine hydrochloride CRS.

B. Solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in carbon dioxide-free water R and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S add 0.2 ml of bromothymol blue solution R1. Not more than 0.1 ml of 0.01 M hydrochloric acid or 0.01 M sodium hydroxide is required to change the colour of the solution.

Related substances. Liquid chromatography (2.2.29).

Solvent mixture: acetonitrile for chromatography R, water R (45:55 V/V).

Test solution. Dissolve 0.125 g of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dissolve 1 mg of azelastine impurity B CRS, 1 mg of azelastine impurity D CRS and 1 mg of azelastine impurity E CRS in the test solution and dilute to 20 ml with the test solution.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: nitrile silica gel for chromatography R (10 μ m),
- temperature: 30 °C.

Mobile phase: dissolve 2.16 g of sodium octanesulphonate R and 0.68 g of potassium dihydrogen phosphate R in 740 ml of water for chromatography R, adjust to pH 3.0-3.1 with dilute phosphoric acid R, add 260 ml of acetonitrile for chromatography R and mix.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 μ l.

Run time: twice the retention time of azelastine.

Relative retention with reference to azelastine (retention time = about 8-9 min): impurity A = about 0.2; impurity B = about 0.3; impurity C = about 0.4; impurity D = about 0.6; impurity E = about 1.4.

System suitability: reference solution (b):

- resolution: minimum 4.0 between the peaks due to impurity B and impurity D,
- the peaks due to impurity D and impurity E are baseline separated from the principal peak.

Limits:

- correction factors: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 3.6; impurity D = 0.7; impurity E = 2.1;

- impurities A, B, C, D, E: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- any other impurity: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- total: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- disregard limit: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.300 g in 5 ml of anhydrous formic acid R. Add 30 ml of acetic anhydride R. Titrate quickly with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1.0 ml of 0.1 M perchloric acid is equivalent to 41.84 mg of $C_{22}H_{25}Cl_2N_3O$.

IMPURITIES

Specified impurities: A, B, C, D, E.

A. benzoyldiazane (benzohydrazide),

and enantiomer

B. 1-benzoyl-2-[(4RS)-1-methylhexahydro-1H-azepin-4-yl]diazane,

C. 2-[(4-chlorophenyl)acetyl]benzoic acid,

D. 4-(4-chlorobenzyl)phthalazin-1(2H)-one,

E. 3-(4-chlorobenzylidene)isobenzofuran-1(3H)-one.

01/2005:1649
corrected**AZITHROMYCIN**

Azithromycinum

 $C_{38}H_{72}N_2O_{12}$ M_r 749**DEFINITION**

(2*R*,3*S*,4*R*,5*R*,8*R*,10*R*,11*R*,12*S*,13*S*,14*R*)-13-[(2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl- α -L-*ribo*-hexopyranosyl)oxy]-2-ethyl-3,4,10-trihydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[3,4,6-trideoxy-3-(dimethylamino)- β -D-*xylo*-hexopyranosyl]oxy]-1-oxa-6-azacyclopentadecan-15-one.

Content: 94.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in ethanol and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: azithromycin CRS.

If the spectra obtained show differences, prepare further spectra using 90 g/l solutions in *methylene chloride R*.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with test solution (b) is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 0.500 g in *ethanol R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3): 9.0 to 11.0.

Dissolve 0.100 g in 25.0 ml of *methanol R* and dilute to 50.0 ml with *carbon dioxide-free water R*.

Specific optical rotation (2.2.7): -45 to -49 (anhydrous substance), determined on solution S.

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use.

Solvent mixture: acetonitrile *R*, water *R* (40:60 V/V).

Test solution (a). Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Test solution (b). Dilute 5.0 ml of test solution (a) to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 50.0 mg of *azithromycin CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5.0 mg of *azithromycin CRS* and 5.0 mg of *azithromycin impurity A CRS* in the solvent mixture and dilute to 50 ml with the solvent mixture.

Reference solution (d). Dissolve 2 mg of *azithromycin impurity B CRS* in the solvent mixture and dilute to 50 ml with the solvent mixture. Use this solution only for identification of the peak due to impurity B.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** end-capped polar-embedded octadecylsilyl amorphous organosilica polymer *R* (5 μ m),
- **temperature:** 70 °C.

Mobile phase: mix 10 volumes of a 34.84 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 6.5 with *phosphoric acid R*, 35 volumes of *acetonitrile R* and 55 volumes of *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 100 μ l; inject test solution (a) and reference solutions (b), (c) and (d).

Run time: 4.5 times the retention time of azithromycin.

Relative retention with reference to azithromycin (retention time = about 26 min): impurity D = about 0.37; impurity J = about 0.39; impurity A = about 0.42; impurity I = about 0.5; impurity C = about 0.65; impurity K = about 0.9; impurity F = about 1.6; impurity B = about 1.7; impurity G = about 2.8.

System suitability: reference solution (c):

- **resolution:** minimum 7.0 between the peaks due to impurity A and azithromycin.

Limits:

- **impurity B:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5.0 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.4.8): maximum 25 ppm.

Dissolve 2.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *ethanol R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B. Prepare the standard using lead standard solution (2.5 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *ethanol R*.

Water (2.5.12): 1.8 per cent to 6.5 per cent, determined on 0.20 g.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances, with the following modifications.

Injection: 25 µl; inject test solution (b) and reference solution (a).

Calculate the percentage content of $C_{38}H_{72}N_2O_{12}$ using the declared content of *azithromycin CRS*.

STORAGE

In an airtight container.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J, K.

- A. R1 = OH, R2 = H, R3 = R4 = R5 = CH₃:

01/2005:0808

BACAMPICILLIN HYDROCHLORIDE

Bacampicillini hydrochloridum

 $C_{21}H_{28}ClN_3O_7S$ M_r 502.0

DEFINITION

Bacampicillin hydrochloride contains not less than 95.0 per cent and not more than the equivalent of 102.0 per cent of (1*RS*)-1-[(ethoxycarbonyl)oxy]ethyl (2*S*,5*R*,6*R*)-6-[(2*R*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate hydrochloride, calculated with reference to the anhydrous, solvent-free substance.

PRODUCTION

If manufactured by a process that may leave residues of dimethylaniline in the substance and/or by a process using starting materials or intermediates which contain residues of dimethylaniline, it complies with the following test:

N,N-Dimethylaniline (2.4.26, *Method A*). Not more than 20 ppm.

CHARACTERS

A white or almost white powder or granules, hygroscopic, soluble in water, freely soluble in alcohol, soluble in methylene chloride.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bacampicillin hydrochloride CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silanised silica gel plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in 2 ml of *methanol R*.

Reference solution (a). Dissolve 10 mg of *bacampicillin hydrochloride CRS* in 2 ml of *methanol R*.

Reference solution (b). Dissolve 10 mg each of *bacampicillin hydrochloride CRS*, *talampicillin hydrochloride CRS* and *pivampicillin CRS* in 2 ml of *methanol R*.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of a 272 g/l solution of *sodium acetate R*, the pH of which has been adjusted to 5.0 with *glacial acetic acid R*, 40 volumes of *water R* and 50 volumes of *alcohol R*. Dry the plate in a current of warm air, then spray with *ninhydrin solution R1* and heat at 60 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube on a water-bath for 1 min; a dark yellow colour develops.
- D. Dissolve about 25 mg in 2 ml of *water R*. Add 2 ml of *dilute sodium hydroxide solution R* and shake. Wait a few minutes and add 3 ml of *dilute nitric acid R* and 0.5 ml of *silver nitrate solution R1*. A white precipitate is formed. Add 0.5 ml of *concentrated ammonia R*. The precipitate dissolves.

TESTS

Appearance of solution. Dissolve 0.200 g in 20 ml of *water R*; the solution is not more opalescent than reference suspension II (2.2.1). Dissolve 0.500 g in 10 ml of *water R*; the absorbance (2.2.25) of the solution measured at 430 nm is not greater than 0.10.

pH (2.2.3). Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent. The pH of the solution is 3.0 to 4.5.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 175 to + 195, calculated with reference to the anhydrous, solvent-free substance.

Butyl acetate and ethyl acetate. Not more than 2.0 per cent *m/m* of butyl acetate, not more than 4.0 per cent *m/m* of ethyl acetate and not more than 5.0 per cent *m/m* for the sum determined by head-space gas chromatography (2.2.28), using the method of standard additions.

Sample solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

The chromatographic procedure may be carried out using System A of the test for residual solvents (2.4.24) and the following static head-space injection conditions:

- equilibration temperature: 60 °C,
- equilibration time: 20 min.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed in the Assay. Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (d). The test is not valid unless in the chromatogram obtained, the peak corresponding to ampicillin is separated from the peaks due to the solvent. Inject 20 µl of the test solution and continue the chromatography for 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Water (2.5.12). Not more than 0.8 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 1.5 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29). Prepare the test solution and reference solutions (a), (b) and (d) immediately before use.

Phosphate buffer A. Dissolve 1.4 g of sodium dihydrogen phosphate monohydrate *R* in water *R* and dilute to about 800 ml with the same solvent. Adjust to pH 3.0 with dilute phosphoric acid *R* and dilute to 1000.0 ml with water *R*.

Phosphate buffer B. Dissolve 2.75 g of sodium dihydrogen phosphate monohydrate *R* and 2.3 g of disodium hydrogen phosphate dihydrate *R* in water *R* and dilute to about 1800 ml with the same solvent. Adjust to pH 6.8, if necessary, using dilute phosphoric acid *R* or dilute sodium hydroxide solution *R* and dilute to 2000.0 ml with water *R*.

Test solution. Dissolve 30.0 mg of the substance to be examined in phosphate buffer A and dilute to 100.0 ml with the same solution.

Reference solution (a). Dissolve 30.0 mg of bacampicillin hydrochloride CRS in phosphate buffer A and dilute to 100.0 ml with the same solution.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with phosphate buffer A.

Reference solution (c). Dissolve 30 mg of the substance to be examined in phosphate buffer B and dilute to 100 ml with the same solution. Heat the solution at 80 °C for about 30 min.

Reference solution (d). Dissolve 20 mg of ampicillin trihydrate CRS in phosphate buffer A and dilute to 250 ml with the same solution. Dilute 5 ml of the solution to 100 ml with phosphate buffer A.

The chromatographic procedure may be carried out using:

- a column 0.05 m long and 3.9 mm in internal diameter packed with octadecylsilyl silica gel for chromatography *R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 30 volumes of acetonitrile *R* and 70 volumes of a 0.06 per cent *m/m* solution of tetrahexylammonium hydrogen sulphate *R* in phosphate buffer B,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (c). The test is not valid unless, in the chromatogram obtained, the retention time of a degradation product eluting just after bacampicillin is 1.12 to 1.38 relative to bacampicillin. If necessary adjust the concentration of tetrahexylammonium hydrogen sulphate in the mobile phase. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area for bacampicillin is at most 1.0 per cent. Inject alternately the test solution and reference solution (a). Calculate the percentage content of bacampicillin hydrochloride.

STORAGE

Store in an airtight container.

IMPURITIES

- A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- B. *R* = H: (2*R*)-2-amino-2-phenylacetic acid (D-phenylglycine),

- G. *R* = CH₃: methyl (2*R*)-2-amino-2-phenylacetate (methyl D-phenylglycinate),

- C. *R* = H: (2*RS*,4*S*)-2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of ampicillin),

- D. *R* = CO₂H: (4*S*)-2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]carboxymethyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of ampicillin),

- E. (4*S*)-2-(3,6-dioxo-5-phenylpiperazin-2-yl)-5,5-dimethylthiazolidine-4-carboxylic acid (diketopiperazines of ampicillin),

- F. (2*RS*)-2-amino-3-methyl-3-sulphanylbutanoic acid (DL-penicillamine),

- H. (1*RS*)-1-[(ethoxycarbonyl)oxy]ethyl (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-(acetyl)amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (*N*-acetyl bacampicillin),

- I. ampicillin.

01/2005:0465 pH (2.2.3): 6.0 to 7.0 for solution S.

BACITRACIN**Bacitracinum**

Name	Mol. Formula	X	Y	R
Bacitracin A	C ₆₆ H ₁₀₃ N ₁₇ O ₁₆ S	L-Ile	L-Ile	CH ₃
Bacitracin B1	C ₆₅ H ₁₀₁ N ₁₇ O ₁₆ S	L-Ile	L-Ile	H
Bacitracin B2	C ₆₅ H ₁₀₁ N ₁₇ O ₁₆ S	L-Val	L-Ile	CH ₃
Bacitracin B3	C ₆₅ H ₁₀₁ N ₁₇ O ₁₆ S	L-Ile	L-Val	CH ₃

DEFINITION

Mixture of antimicrobial polypeptides produced by certain strains of *Bacillus licheniformis* or *Bacillus subtilis*, the main components being bacitracins A, B1, B2 and B3.

Content: minimum 60 IU/mg (dried substance).

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: freely soluble in water and in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in a 3.4 g/l solution of *hydrochloric acid R* and dilute to 1.0 ml with the same solution.

Reference solution. Dissolve 10 mg of *bacitracin zinc CRS* in a 3.4 g/l solution of *hydrochloric acid R* and dilute to 1.0 ml with the same solution.

Plate: TLC silica gel plate R.

Mobile phase: glacial acetic acid R, water R, butanol R (1:2:4 V/V/V).

Application: 10 µl.

Development: over half of the plate.

Drying: at 100-105 °C.

Detection: spray with *ninhydrin solution R1* and heat at 110 °C for 5 min.

Results: the spots in the chromatogram obtained with the test solution are similar in position, size and colour to the spots in the chromatogram obtained with the reference solution.

B. It complies with the test for composition (see Tests).

C. Ignite 0.2 g. An insignificant residue remains which is not yellow at high temperature. Allow to cool. Dissolve the residue in 0.1 ml of *dilute hydrochloric acid R*. Add 5 ml of *water R* and 0.2 ml of *strong sodium hydroxide solution R*. No white precipitate is formed.

TESTS

Solution S. Dissolve 0.25 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1).

Composition. Liquid chromatography (2.2.29): use the normalisation procedure. *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.100 g of the substance to be examined in 50.0 ml of the mobile phase.

Reference solution (a). Suspend 20.0 mg of *bacitracin zinc CRS* in *water R*, add 0.2 ml of *dilute hydrochloric acid R* and dilute to 10.0 ml with *water R*.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

Reference solution (d). Dissolve 50.0 mg of the substance to be examined in 25.0 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 7.0 with *dilute sodium hydroxide R*. Heat in a boiling water-bath for 30 min. Cool to room temperature.

Blank solution. A 40 g/l solution of *sodium edetate R* adjusted to pH 7.0 with *dilute sodium hydroxide R*.

Column:

— **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,

— **stationary phase:** end-capped octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: add 520 volumes of *methanol R1*, 40 volumes of *acetonitrile R* and 300 volumes of *water R* to 100 volumes of a 34.8 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 6.0 with a 27.2 g/l solution of *potassium dihydrogen phosphate R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 100 µl; inject the blank, the test solution and reference solutions (a) and (c).

Run time: 3 times the retention time of bacitracin A.

Relative retention with reference to bacitracin A (retention time = 15 min to 25 min): bacitracin B1 = about 0.6; bacitracin B3 = about 0.8; impurity E = about 2.5.

If necessary, adjust the composition of the mobile phase by changing the amount of organic modifier whilst keeping the ratio constant between methanol and acetonitrile.

System suitability: reference solution (a):

— **peak-to-valley ratio:** minimum of 1.2, where H_p = height above the baseline of the peak due to bacitracin B1 and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to bacitracin B2.

Limits:

— **bacitracin A:** minimum 40.0 per cent,

— **sum of bacitracins A, B1, B2 and B3:** minimum 70.0 per cent,

— **disregard limit:** the area of the peak due to bacitracin A in the chromatogram obtained with reference solution (c) (0.5 per cent); disregard any peak observed in the blank run.

Related peptides. Liquid chromatography (2.2.29) as described in the test for composition.

See Figure 0465-1.

Limit:

— **sum of the areas of all peaks eluting before the peak due to bacitracin B1:** maximum 20.0 per cent.

Impurity E. Liquid chromatography (2.2.29) as described in the test for composition.

See Figure 0465-2.

Figure 0465.-1. – Chromatogram of the test for composition in bacitracin obtained with the test solution at 254 nm

Figure 0465.-2. – Chromatogram of the test for impurity E in bacitracin obtained with reference solution (d) at 300 nm

Detection: spectrophotometer at 254 nm; spectrophotometer at 300 nm for reference solution (d).

Injection: test solution and reference solutions (b) and (d).

Limit:

- **impurity E:** not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (6.0 per cent).

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.1 kPa for 3 h.

Sulphated ash (2.4.14): maximum 1.0 per cent, determined on 1.0 g.

Sterility (2.6.1). If intended for the preparation of ophthalmic dosage forms without a further appropriate sterilisation procedure, it complies with the test for sterility.

Bacterial endotoxins (2.6.14): less than 0.8 IU/mg, if intended for use in the manufacture of ophthalmic dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2). Use *bacitracin zinc CRS* as the reference substance.

STORAGE

In an airtight container at 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable:

- that the substance is sterile,
- that the substance is free from bacterial endotoxins.

IMPURITIES

- A. X = L-Val, Y = L-Ile, R = H: bacitracin C1,
 B. X = L-Ile, Y = L-Val, R = H: bacitracin C2,
 C. X = Y = L-Val, R = CH₃: bacitracin C3,
 D. X = Y = L-Val, R = H: bacitracin E,

- E. X = Y = L-Ile, R = CH₃: bacitracin F,
 F. X = Y = L-Ile, R = H: bacitracin H1,
 G. X = L-Val, Y = L-Ile, R = CH₃: bacitracin H2,
 H. X = L-Ile, Y = L-Val, R = CH₃: bacitracin H3,
 I. X = L-Val, Y = L-Ile, R = H: bacitracin I1,

BACITRACIN ZINC

Bacitracinum zincum

DEFINITION

Zinc complex of bacitracin, which consists of a mixture of antimicrobial polypeptides produced by certain strains of *Bacillus licheniformis* or *Bacillus subtilis*, the main components being bacitracins A, B1, B2 and B3.

Content: minimum 60 IU/mg (dried substance).

CHARACTERS

Appearance: white or light yellowish-grey powder, hygroscopic.

Solubility: slightly soluble in water and in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in 0.5 ml of *dilute hydrochloric acid R* and dilute to 1.0 ml with *water R*.

Reference solution. Dissolve 10 mg of *bacitracin zinc CRS* in 0.5 ml of *dilute hydrochloric acid R* and dilute to 1.0 ml with *water R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R, water R, butanol R* (1:2:4 V/V/V).

Application: 10 µl.

Development: over half of the plate.

Drying: at 100-105 °C.

Detection: spray with *ninhydrin solution R1* and heat at 110 °C for 5 min.

Results: the spots in the chromatogram obtained with the test solution are similar in position, size and colour to the spots in the chromatogram obtained with the reference solution.

B. It complies with the test for composition (see Tests).

C. Ignite about 0.15 g, allow to cool and dissolve the residue in 1 ml of *dilute hydrochloric acid R*. Add 4 ml of *water R*. The solution gives the reaction of zinc (2.3.1).

TESTS

pH (2.2.3): 6.0 to 7.5.

Shake 1.0 g for about 1 min with 10 ml of *carbon dioxide-free water R* and filter.

Composition. Liquid chromatography (2.2.29): use the normalisation procedure. *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.100 g of the substance to be examined in 50.0 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 7.0 with *dilute sodium hydroxide R*.

Reference solution (a). Dissolve 20.0 mg of *bacitracin zinc CRS* in 10.0 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 7.0 with *dilute sodium hydroxide R*.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *water R*.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *water R*.

Figure 0466.-1. – Chromatogram of the test for composition in bacitracin zinc obtained with the test solution at 254 nm

Reference solution (d). Dissolve 50.0 mg of the substance to be examined in 25.0 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 7.0 with *dilute sodium hydroxide R*. Heat in a boiling water-bath for 30 min. Cool to room temperature.

Blank solution. A 40 g/l solution of *sodium edetate R* adjusted to pH 7.0 with *dilute sodium hydroxide R*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: end-capped octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: add 520 volumes of *methanol R1*, 40 volumes of *acetonitrile R* and 300 volumes of *water R* to 100 volumes of a 34.8 g/l solution of *dipotassium hydrogen phosphate R*, adjusted to pH 6.0 with a 27.2 g/l solution of *potassium dihydrogen phosphate R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 100 μ l; inject the blank, the test solution and reference solutions (a) and (c).

Run time: 3 times the retention time of bacitracin A.

Relative retention with reference to bacitracin A (retention time = 15 min to 25 min): bacitracin B1 = about 0.6; bacitracin B3 = about 0.8; impurity E = about 2.5.

If necessary, adjust the composition of the mobile phase by changing the amount of organic modifier whilst keeping the ratio constant between methanol and acetonitrile.

System suitability: reference solution (a):

- **peak-to-valley ratio:** minimum of 1.2, where H_p = height above the baseline of the peak due to bacitracin B1 and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to bacitracin B2.

Limits:

- **bacitracin A:** minimum 40.0 per cent,
- **sum of bacitracins A, B1, B2 and B3:** minimum 70.0 per cent.
- **disregard limit:** the area of the peak due to bacitracin A in the chromatogram obtained with reference solution (c) (0.5 per cent); disregard any peak observed in the blank run.

Related peptides. Liquid chromatography (2.2.29) as described in the test for composition.

See Figure 0466.-1.

Limit:

- **sum of the areas of all peaks eluting before the peak due to bacitracin B1:** maximum 20.0 per cent.

Impurity E. Liquid chromatography (2.2.29) as described in the test for composition.

See Figure 0466.-2.

Detection: spectrophotometer at 254 nm; spectrophotometer at 300 nm for reference solution (d).

Injection: test solution and reference solutions (b) and (d).

Limit:

- **impurity E:** not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (6.0 per cent).

Figure 0466.-2. — Chromatogram of the test for impurity E in bacitracin zinc obtained with reference solution (d) at 300 nm

Zinc: 4.0 per cent to 6.0 per cent (dried substance).

Dissolve 0.200 g in a mixture of 2.5 ml of *dilute acetic acid R* and 2.5 ml of water. Add 50 ml of *water R*, 50 mg of *xylene orange triturate R* and sufficient *hexamethylenetetramine R* to produce a red colour. Add 2 g of *hexamethylenetetramine R* in excess. Titrate with 0.01 M *sodium edetate* until a yellow colour is obtained.

1 ml of 0.01 M *sodium edetate* is equivalent to 0.654 mg of Zn.

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.1 kPa for 3 h.

Sterility (2.6.1). If intended for administration by spraying into internal body cavities without a further appropriate sterilisation procedure, it complies with the test for sterility.

Pyrogens (2.6.8). If intended for administration by spraying into internal body cavities without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 ml of the supernatant liquid obtained by centrifuging a suspension containing 11 mg per millilitre in a 9 g/l solution of *sodium chloride R*.

ASSAY

Suspend 50.0 mg in 5 ml of *water R*, add 0.5 ml of *dilute hydrochloric acid R* and dilute to 100.0 ml with *water R*. Allow the solution to stand for 30 min. Carry out the microbiological assay of antibiotics (2.7.2).

STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable:

- that the substance is sterile,
- that the substance is apyrogenic.

IMPURITIES

A. X = L-Val, Y = L-Ile, R = H: bacitracin C1,

B. X = L-Ile, Y = L-Val, R = H: bacitracin C2,

C. X = Y = L-Val, R = CH₃: bacitracin C3,

D. X = Y = L-Val, R = H: bacitracin E,

E. X = Y = L-Ile, R = CH₃: bacitracin F,

F. X = Y = L-Ile, R = H: bacitracin H1,

G. X = L-Val, Y = L-Ile, R = CH₃: bacitracin H2,

H. X = L-Ile, Y = L-Val, R = CH₃: bacitracin H3,

I. X = L-Val, Y = L-Ile, R = H: bacitracin I1,

J. X = L-Ile, Y = L-Val, R = H: bacitracin I2,

K. X = Y = L-Val, R = CH₃: bacitracin I3.

01/2005:0653

BACLOFEN

Baclofenum

C₁₀H₁₂ClNO₂

M_r 213.7

DEFINITION

Baclofen contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (3*RS*)-4-amino-3-(4-chlorophenyl)butanoic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, slightly soluble in water, very slightly soluble in alcohol, practically insoluble in acetone. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

It shows polymorphism.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- Dissolve 70 mg in *water R* and dilute to 100.0 ml with the same solvent. Examined between 220 nm and 320 nm (2.2.25), the solution shows three absorption maxima, at 259 nm, 266 nm and 275 nm. The specific absorbances at these maxima are 9.8 to 10.8, 11.5 to 12.7 and 8.4 to 9.3, respectively. The test is not valid unless in the test for resolution (2.2.25) the ratio of absorbances is at least 1.5.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *baclofen CRS*. Examine as discs prepared using 3 mg of substance and 300 mg of *potassium bromide R*. If the spectra obtained with the substance to be examined and the reference substance show differences, dissolve 0.1 g of each of the substances separately in 1 ml of *dilute sodium hydroxide solution R* and add 10 ml of *alcohol R* and 1 ml of *dilute acetic acid R*. Allow to stand for 1 h. Filter, wash the precipitate with *alcohol R* and dry *in vacuo*. Prepare new discs and record the spectra.

- Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in the mobile phase (see below) and dilute to 10 ml with the mobile phase.

Reference solution. Dissolve 10 mg of *baclofen CRS* in the mobile phase and dilute to 10 ml with the mobile phase.

Apply separately to the plate 5 µl of each solution.

Develop over a path of 12 cm using a mixture of 5 volumes of *anhydrous formic acid R*, 5 volumes of *water R*, 20 volumes of *methanol R*, 30 volumes of *chloroform R* and 40 volumes of *ethyl acetate R*. Allow the solvents to evaporate. Spray with *ninhydrin solution R3* until the plate is slightly wet. Place the plate in an oven maintained at 100 °C for 10 min. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. Dissolve 0.50 g in 1 M *sodium hydroxide* and dilute to 25 ml with the same solvent. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *baclofen impurity A CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 2.0 ml of the test solution and 2.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 µm),
- as mobile phase at a flow-rate of 2.0 ml/min a mixture prepared as follows: dissolve 1.822 g of *sodium hexanesulphonate R* in 1 litre of a mixture of 560 volumes of *water R*, 440 volumes of *methanol R* and 5 volumes of *glacial acetic acid R*,
- as detector a spectrophotometer set at 266 nm.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (c) is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (d). The test is not valid unless the resolution between the peaks corresponding to baclofen and baclofen impurity A is at least 2.0. Inject separately 20 µl of the test solution, reference solution (b) and reference solution (c). Continue the chromatography for five times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of the peak corresponding to baclofen impurity A is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the sum of the areas of all the peaks, apart

from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

Water (2.5.12). Not more than 1.0 per cent, determined on 1.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.1500 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 21.37 mg of $C_{10}H_{12}ClNO_2$.

IMPURITIES

A. (4*RS*)-4-(4-chlorophenyl)pyrrolidin-2-one,

B. (3*RS*)-5-amino-3-(4-chlorophenyl)-5-oxopentanoic acid.

01/2005:1293

BAMBUTEROL HYDROCHLORIDE

Bambuteroli hydrochloridum

$C_{18}H_{30}ClN_3O_5$

M_r 403.9

DEFINITION

Bambuterol hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 5-[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-hydroxyethyl]-1,3-phenylene bis(dimethylcarbamate) hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bambuterol hydrochloride CRS*. Examine the substances prepared as discs. If the spectra obtained

show differences, dissolve the substance to be examined and the reference substance in a mixture of 1 volume of *water R* and 6 volumes of *acetone R*, cool in ice to precipitate and dry both precipitates *in vacuo* at 50 °C to constant weight. Record new spectra using the residues.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 4.0 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

Acidity or alkalinity. To 10 ml of solution S add 0.2 ml of *methyl red solution R* and 0.2 ml of 0.01 M *hydrochloric acid*. The solution is red. Add 0.4 ml of 0.01 M *sodium hydroxide*. The solution is yellow.

Optical rotation (2.2.7). Dilute 1 ml of solution S to 10 ml with *carbon dioxide-free water R*. The angle of optical rotation is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 5.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 1.0 mg of *formoterol fumarate dihydrate CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Mix 0.8 ml of the solution with 0.4 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 20.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1.5 ml/min a mixture prepared as follows: dissolve 1.3 g of *sodium octanesulphonate R* in 430 ml of a mixture of 25 volumes of *acetonitrile R1* and 75 volumes of *methanol R*; then mix this solution with 570 ml of 0.050 M phosphate buffer pH 3.0 (dissolve 6.90 g of *sodium dihydrogen phosphate monohydrate R* in *water R* and dilute to 1000 ml with *water R*, adjust the pH to 3.0 with a 50 g/l solution of *dilute phosphoric acid R*),
- as detector a spectrophotometer set at 214 nm.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 μ l of reference solution (b) is about 50 per cent of the full scale of the recorder.

Inject 20 μ l of reference solution (a). When the chromatograms are recorded under the prescribed conditions, the retention times are: *formoterol* about 7 min and *bambuterol* about 9 min. The test is not valid unless the resolution between the peaks corresponding to *bambuterol* and *formoterol* is at least 5.0. Continue the chromatography of the test solution for 1.5 times the retention time of *bambuterol*. If necessary adjust the composition of the mobile phase. Increase the content of phosphate buffer to increase the retention time.

Inject separately 20 μ l of the mobile phase, 20 μ l of the test solution and 20 μ l of reference solution (b). In the chromatogram obtained with the test solution the area of any peak, apart from the principal peak, is not greater than the area of the principal peak obtained with reference solution (b) (0.2 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than three times the area of the principal peak in the

chromatogram obtained with reference solution (b) (0.6 per cent). Disregard any peak due to the mobile phase and any peak with an area less than 0.25 times the area of the principal peak obtained with reference solution (b).

Water (2.5.12). Not more than 0.5 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.320 g in 50 ml of *alcohol R* and add 5 ml of 0.01 *M* hydrochloric acid. Carry out a potentiometric titration (2.2.20), using 0.1 *M* sodium hydroxide. Read the volume added between the two points of inflexion.

1 ml of 0.1 *M* sodium hydroxide is equivalent to 40.39 mg of $C_{18}H_{30}ClN_3O_5$.

IMPURITIES

- A. $R_1 = NH-C(CH_3)_3$, $R_2 = R_3 = H$: (1*RS*)-1-(3,5-dihydroxyphenyl)-2-[(1,1-dimethylethyl)amino]ethanol (terbutaline),
- B. $R_1 = OH$, $R_2 = R_3 = CO-N(CH_3)_2$: 5-[(1*RS*)-1,2-dihydroxyethyl]-1,3-phenylene bis(dimethylcarbamate),
- C. $R_1 = NH-C(CH_3)_3$, $R_2 = H$, $R_3 = CO-N(CH_3)_2$: 3-[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-hydroxyethyl]-5-hydroxyphenyl dimethylcarbamate,
- D. $R_1 = H$, $R_2 = R_3 = CO-N(CH_3)_2$: 5-[(1*RS*)-1-hydroxyethyl]-1,3-phenylene bis(dimethylcarbamate),

- E. $R = H$: 5-acetyl-1,3-phenylene bis(dimethylcarbamate),
- F. $R = NH-C(CH_3)_3$: 5-[[[(1,1-dimethylethyl)amino]acetyl]-1,3-phenylene bis(dimethylcarbamate).

DEFINITION

Barbital contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5,5-diethylpyrimidine-2,4,6-(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, slightly soluble in water, soluble in boiling water and in alcohol. It forms water-soluble compounds with alkali hydroxides and carbonates and with ammonia.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. Determine the melting point (2.2.14) of the substance to be examined. Mix equal parts of the substance to be examined and *barbital CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 190 °C) is not greater than 2 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *barbital CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 75 mg of the substance to be examined in *alcohol R* and dilute to 25 ml with the same solvent.

Reference solution. Dissolve 75 mg of *barbital CRS* in *alcohol R* and dilute to 25 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- D. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 4 ml of *dilute sodium hydroxide solution R* and 6 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Acidity. Boil 1.0 g with 50 ml of *water R* for 2 min, allow to cool and filter. To 10 ml of the filtrate add 0.15 ml of *methyl red solution R*. The solution is orange-yellow. Not more than 0.1 ml of 0.1 *M* sodium hydroxide is required to produce a pure yellow colour.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *alcohol R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with

01/2005:0170

BARBITAL

Barbitalum

$C_8H_{12}N_2O_3$

M_r 184.2

aldehyde-free alcohol R. Heat at 100 °C to 105 °C for 5 min and examine immediately. When examined in ultraviolet light and after spraying, any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 85.0 mg in 5 ml of *pyridine R*. Add 0.5 ml of *thymolphthalein solution R* and 10 ml of *silver nitrate solution in pyridine R*. Titrate with 0.1 M *ethanolic sodium hydroxide* until a pure blue colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 9.21 mg of $C_8H_{12}N_2O_3$.

BaSO₄M_r 233.4

CHARACTERS

A fine, heavy, white powder, free from gritty particles, practically insoluble in water and in organic solvents. It is very slightly soluble in acids and in solutions of alkali hydroxides.

IDENTIFICATION

- A. Boil 0.2 g with 5 ml of a 500 g/l solution of *sodium carbonate R* for 5 min, add 10 ml of *water R*, filter and acidify a part of the filtrate with *dilute hydrochloric acid R*. The solution gives the reactions of sulphates (2.3.1).
- B. Wash the residue collected in the preceding test with three successive small quantities of *water R*. To the residue add 5 ml of *dilute hydrochloric acid R*, filter and add to the filtrate 0.3 ml of *dilute sulphuric acid R*. A white precipitate is formed that is insoluble in *dilute sodium hydroxide solution R*.

TESTS

Solution S. To 20.0 g add 40 ml of *distilled water R* and 60 ml of *dilute acetic acid R*. Boil for 5 min, filter and dilute the cooled filtrate to 100 ml with *distilled water R*.

Acidity or alkalinity. Heat 5.0 g with 20 ml of *carbon dioxide-free water R* on a water-bath for 5 min and filter. To 10 ml of the filtrate add 0.05 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Acid-soluble substances. Evaporate 25 ml of solution S to dryness on a water-bath and dry to constant mass at 100–105 °C. The residue weighs not more than 15 mg (0.3 per cent).

Oxidisable sulphur compounds. Shake 1.0 g with 5 ml of *water R* for 30 s and filter. To the filtrate add 0.1 ml of *starch solution R*, dissolve 0.1 g of *potassium iodide R* in the mixture, add 1.0 ml of a freshly prepared 3.6 mg/l solution of *potassium iodate R* and 1 ml of 1 M *hydrochloric acid*

and shake well. The colour of the solution is more intense than that of a standard prepared at the same time and in the same manner omitting the potassium iodate.

Soluble barium salts. To 10 ml of solution S add 1 ml of *dilute sulphuric acid R*. After 1 h, any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S and 1 ml of *distilled water R*.

Phosphates. To 1.0 g add a mixture of 3 ml of *dilute nitric acid R* and 7 ml of *water R*. Heat on a water-bath for 5 min, filter and dilute the filtrate to 10 ml with *water R*. Add 5 ml of *molybdovanadic reagent R*. After 5 min, any yellow colour in the test solution is not more intense than that in a standard prepared at the same time and in the same manner using 10 ml of *phosphate standard solution* (5 ppm PO₄) R (50 ppm).

Arsenic (2.4.2). In a small long-necked combustion flask, shake 0.5 g with 2 ml of *nitric acid R* and 30 ml of *water R*, insert a small funnel in the neck of the flask, heat in an inclined position on a water-bath for 2 h, allow to cool, adjust to the original volume with *water R* and filter. Wash the residue by decantation with three quantities, each of 5 ml, of *water R*. Combine the filtrate and washings, add 1 ml of *sulphuric acid R*, evaporate to dryness on a water-bath, and heat until copious white fumes are evolved. Dissolve the residue in 10 ml of *dilute sulphuric acid R* and add 10 ml of *water R*. The solution complies with limit test A for arsenic (2 ppm).

Heavy metals (2.4.8). Dilute 10 ml of solution S to 20 ml with *water R*, 12 ml of this solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) R.

Loss on ignition. Not more than 2.0 per cent, determined on 1.0 g at 600 °C.

Sedimentation. Place 5.0 g in a glass-stoppered, 50 ml graduated cylinder having the 50 ml graduation mark 14 cm from the base. Add *water R* to 50 ml, shake the mixture for 5 min and allow to stand for 15 min. The barium sulphate does not settle below the 15 ml mark.

01/2005:1975

BASIC BUTYLATED METHACRYLATE COPOLYMER

Copolymerum methacrylatis butylati basicum

DEFINITION

Copolymer of 2-(dimethylamino)ethyl methacrylate, butyl methacrylate and methyl methacrylate having a mean relative molecular mass of about 150 000. The ratio of 2-(dimethylamino)ethyl methacrylate groups to butyl methacrylate and methyl methacrylate groups is about 2:1:1. *Content of dimethylaminoethyl groups*: 20.8 per cent to 25.5 per cent (dried substance).

CHARACTERS

Appearance: colourless or yellowish granules or white powder, slightly hygroscopic.

Solubility: practically insoluble in water, freely soluble in methylene chloride. It dissolves slowly in alcohol.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of basic butylated methacrylate copolymer.

B. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 12.5 g in a mixture of 35.0 g of *acetone R* and 52.5 g of *2-propanol R*.

Viscosity (2.2.10): 3 mPas to 6 mPas, determined on solution S.

Apparatus: rotating viscosimeter.

Dimensions:

- *spindle*: diameter = 25.15 mm, height = 90.74 mm, shaft diameter = 4 mm,
- *cylinder*: diameter = 27.62 mm, height = 0.135 m.

Stirring speed: 30 r/min.

Volume of solution: 16 ml of solution S.

Temperature: 20 °C.

Absorbance (2.2.25): maximum 0.30 at 420 nm, determined on solution S.

Appearance of film. Spread evenly 1.0 ml of solution S on a glass plate. Upon drying a clear film is formed.

Monomers: maximum 0.3 per cent, for the sum of contents of butyl methacrylate, methyl methacrylate and 2-dimethylaminoethyl methacrylate calculated by procedures A and B.

A. Butyl methacrylate and methyl methacrylate. Liquid chromatography (2.2.29).

Test solution. Dissolve 1.00 g of the substance to be examined in *phosphate buffer solution pH 2.0 R* and dilute to 50.0 ml with the same buffer solution.

Reference solution. Dissolve 10.0 mg of *butyl methacrylate R* and 10.0 mg of *methyl methacrylate R* in 10.0 ml of *acetonitrile R* and dilute to 50.0 ml with *water R*. Dilute 1.0 ml of the solution to 50.0 ml with *water R*.

Column:

- *size*: $l = 0.125$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography *R* (7 μ m).

Mobile phase: *phosphate buffer solution pH 2.0 R*, *methanol R* (45:55 *V/V*).

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 50 μ l.

B. 2-Dimethylaminoethyl methacrylate. Liquid chromatography (2.2.29).

Test solution. Dissolve 1.00 g of the substance to be examined in *tetrahydrofuran R* and dilute to 50.0 ml with the same solvent.

Reference solution. Dissolve 10.0 mg of *2-(dimethylamino)ethyl methacrylate R* in *tetrahydrofuran R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of the solution to 50.0 ml with *tetrahydrofuran R*.

Column:

- *size*: $l = 0.125$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: aminopropylsilyl silica gel for chromatography *R* (10 μ m).

Mobile phase: mix 25 volumes of a 3.404 g/l solution of *potassium dihydrogen phosphate R* and 75 volumes of *tetrahydrofuran R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 50 μ l.

Heavy metals (2.4.8): maximum 20 ppm.

2.0 g complies with limit test C. Prepare the standard using 4.0 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 2.0 per cent, determined on 1.000 g by drying in an oven at 110 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 4 ml of *water R* and 96 ml of *anhydrous acetic acid R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 7.21 mg of C_4H_9NO .

STORAGE

In an airtight container.

IMPURITIES

A. $\text{R} = [\text{CH}_2]_3\text{-CH}_3$: butyl methacrylate,

B. $\text{R} = \text{CH}_3$: methyl methacrylate,

C. $\text{R} = \text{CH}_2\text{-CH}_2\text{-N}(\text{CH}_3)_2$: 2-(dimethylamino)ethyl methacrylate.

01/2005:1054

BEARBERRY LEAF

Uvae ursi folium

DEFINITION

Whole or cut, dried leaf of *Arctostaphylos uva-ursi* (L.) Spreng.

Content: minimum 7.0 per cent of anhydrous arbutin ($C_{12}H_{16}O_7$; M_r 272.3) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaf, shiny and dark green on the adaxial surface, lighter on the abaxial surface, is normally 7 mm to 30 mm long and 5 mm to 12 mm wide. The entire leaf is obovate with smooth margins, somewhat reflexed downwards, narrowing at the base into a short petiole. The leaf is obtuse or retuse at its apex. The lamina is thick and coriaceous. The venation, pinnate and finely reticulate, is clearly visible on both surfaces. The adaxial surface is marked with sunken veinlets, giving it a characteristic grainy appearance. Only the young leaf has ciliated margins. Old leaves are glabrous.
- B. Reduce to a powder (355). The powder is green to greenish-grey or yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder consists of fragments of epidermises which, seen in surface view, show polygonal cells covered by a thick smooth cuticle, and with straight, thick and irregularly pitted walls; anomocytic stomata (2.8.3), surrounded by 5 to 11 subsidiary cells and scars of hair bases only on the abaxial epidermis; fragments of palisade parenchyma, with 3 or 4 layers of cells of unequal lengths, and spongy

parenchyma; groups of lignified fibres from the pericycle, with rows of cells containing prisms of calcium oxalate; occasional conical, unicellular covering trichomes.

C. Thin-layer chromatography (2.2.27).

Test solution. To 0.5 g of the powdered drug (355) add 5 ml of a mixture of equal volumes of *methanol R* and *water R*, and heat under a reflux condenser for 10 min. Filter whilst hot. Wash the flask and the filter with a mixture of equal volumes of *methanol R* and *water R* and dilute to 5 ml with the same mixture of solvents.

Reference solution. Dissolve 25 mg of *arbutin R*, 25 mg of *gallic acid R* and 25 mg of *hydroquinone R* in *methanol R* and dilute to 10.0 ml with the same solvent.

Plate: TLC silica gel G plate *R*.

Mobile phase: *anhydrous formic acid R*, *water R*, *ethyl acetate R* (6:6:88 V/V/V).

Application: 10 µl of the reference solution and 20 µl of the test solution, as bands.

Development: over a path of 15 cm.

Drying: at 105–110 °C until the mobile phase has evaporated.

Detection: spray with a 10 g/l solution of *dichloroquinonechlorimide R* in *methanol R*. Next spray with a 20 g/l solution of *anhydrous sodium carbonate R*.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, 2 or 3 blue bands and several brown or brownish-grey bands may be present in the chromatogram obtained with the test solution.

Top of the plate	
Hydroquinone: a blue zone	A blue zone
Gallic acid: a brownish zone	A brownish zone
_____	_____
_____	_____
Arbutin: a light blue zone	A light blue zone (arbutin)
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 5 per cent of stems and maximum 3 per cent of other foreign matter.

Leaves of different colour: maximum 10 per cent, determined in the same manner as foreign matter (2.8.2).

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100–105 °C for 2 h.

Total ash (2.4.16): maximum 5.0 per cent.

ASSAY

Liquid chromatography (2.2.29).

Test solution. In a 100 ml flask with a ground-glass neck, place 0.800 g of the powdered drug (250). Add 20 ml of *water R* and heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter the liquid through a plug of absorbent cotton. Add the absorbent cotton to the residue in the 100 ml flask and extract with 20 ml of *water R* under a reflux condenser on a water-bath for 30 min. Allow to cool and filter through a paper filter. Combine the filtrates and dilute to 50.0 ml with *water R*. Filter the liquid through a paper filter. Discard the first 10 ml of the filtrate.

Reference solution. Dissolve 50.0 mg of *arbutin R* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Column:

– **size:** $l = 0.25$ m, $\varnothing = 4$ mm,

– **stationary phase:** *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *methanol R*, *water R* (10:90 V/V).

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 280 nm.

Calculate the percentage content of arbutin using the following expression:

$$\frac{F_1 \times m_2 \times 100}{F_2 \times m_1}$$

F_1 = area of the peak due to arbutin in the chromatogram obtained with the test solution,

F_2 = area of the peak due to arbutin in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined, in grams,

m_2 = mass of *arbutin R* in the reference solution, in grams.

01/2005:0654

BECLOMETASONE DIPROPIONATE

Beclometasoni dipropionas

$C_{28}H_{37}ClO_7$

M_r 521.1

DEFINITION

Beclometasone dipropionate contains not less than 96.0 per cent and not more than the equivalent of 103.0 per cent of 9-chloro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17,21-dipropionate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone, sparingly soluble in alcohol.

It melts at about 210 °C, with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *beclometasone dipropionate CRS*. If the spectra obtained in the solid state with the substance to be examined and the reference substance show differences, record further spectra using 50 g/l solutions in *chloroform R*.

B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. (This solution is also used to prepare test solution (b)). Dilute 2 ml of the solution to 10 ml with *chloroform R*.

Test solution (b). Transfer 2 ml of the solution obtained during preparation of test solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 3 h. Allow to cool.

Reference solution (a). Dissolve 25 mg of *beclometasone dipropionate CRS* in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. (This solution is also used to prepare reference solution (b)). Dilute 2 ml of the solution to 10 ml with *chloroform R*.

Reference solution (b). Transfer 2 ml of the solution obtained during preparation of reference solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 3 h. Allow to cool.

Apply separately to the plate 5 µl of each solution. Prepare the mobile phase by mixing 1.2 volumes of *water R* and 8 volumes of *methanol R* and adding the mixture to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained with test solution (b) shows not fewer than two distinct spots which are similar in position and size to the spots in the chromatogram obtained with reference solution (b). The principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the plate in daylight and in ultraviolet light at 365 nm. The chromatogram obtained with test solution (b) shows not fewer than two distinct spots, similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the spots in the chromatogram obtained with reference solution (b). The principal spot in the chromatogram obtained with test solution (a) is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have R_f values distinctly lower than the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

- C. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a deep reddish-brown colour develops. Add the solution to 10 ml of *water R* and mix. The colour is discharged and a clear solution remains.
- D. Treat 25 mg by the oxygen-flask method (2.5.10). Use a mixture of 1 ml of 1 M *sodium hydroxide* and 20 ml of *water R* to absorb the combustion products. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 88 to + 94, calculated with reference to the dried substance.

Absorbance (2.2.25). Dissolve 50.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 50.0 ml with *alcohol R*. The specific absorbance at the maximum at 238 nm is 284 to 302, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 62.5 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *beclometasone 17-propionate CRS* and 2 mg of *beclometasone 21-propionate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: mix 600 ml of *acetonitrile R* and 350 ml of *water R*, allow to cool, dilute to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm and with the sensitivity adjusted so that the height of the principal peak in the chromatogram obtained with reference solution (b) is 70 per cent to 90 per cent of the full scale.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 45 min. When the chromatograms are recorded in the conditions described above, the retention times are: *beclometasone 17-propionate*, about 6.2 min; *beclometasone 21-propionate*, about 6.7 min; *beclometasone dipropionate*, 13 min to 14 min. Inject 20 µl of reference solution (a). The system is not suitable unless the resolution between the peaks corresponding to *beclometasone 17-propionate* and *beclometasone 21-propionate* is at least 1.4; if this resolution is not achieved, adjust the concentration of *acetonitrile* in the mobile phase. Verify the repeatability by making five separate injections of 20 µl of reference solution (b); the system is not suitable unless the relative standard deviation for the area of the principal peak in the chromatograms obtained with reference solution (b) is less than 2.0 per cent.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 3 h.

ASSAY

Protect the solutions from light throughout the assay. The coloured reaction products tend to adsorb to the surface of glassware. To avoid low results, it is recommended that the glassware be treated with the coloured reaction products before use and that the treated glassware be reserved for this assay and washed only with water R between assays.

Dissolve an accurately weighed quantity in sufficient *aldehyde-free alcohol R* to produce a solution containing 340 µg to 360 µg in 10.0 ml. Prepare a reference solution at the same time and in the same manner, using *beclometasone dipropionate CRS*. Into two 25 ml volumetric flasks, introduce respectively 10.0 ml of each solution. Into a third identical flask, introduce 10 ml of *aldehyde-free alcohol R*. To each flask add 2.0 ml of *triphenyltetrazolium chloride solution R*. Displace the air from the flasks using *oxygen-free nitrogen R*, immediately add 2.0 ml of *dilute tetramethylammonium hydroxide solution R* and again displace the air with *oxygen-free nitrogen R*. Stopper the flasks, mix the contents by gentle swirling and allow to stand in a water-bath at 35 °C for 2 h. Cool rapidly and dilute to 25.0 ml with *aldehyde-free alcohol R*. Immediately measure the absorbance (2.2.25) of the test solution and of the reference solution at the maximum at 485 nm, using a closed 1 cm cell and as the compensation liquid the solution prepared from 10 ml of *aldehyde-free alcohol R*. Treat the test solution and the reference solution in such a manner that the period of time that elapses between the addition of the *dilute tetramethylammonium hydroxide solution R* and measurement of the absorbance is exactly the same for each solution.

Calculate the content of $C_{28}H_{37}ClO_7$ from the absorbances measured and the concentrations of the solutions.

STORAGE

Store protected from light.

01/2005:0069

BEESWAX, WHITE

Cera alba

DEFINITION

Wax obtained by bleaching yellow beeswax.

CHARACTERS

Appearance: white or yellowish-white pieces or plates, translucent when thin, with a fine-grained, matt and non-crystalline fracture; when warmed in the hand they become soft and malleable.

It has an odour similar to that of yellow beeswax, though fainter and never rancid. It is tasteless and does not stick to the teeth.

Solubility: practically insoluble in water, partially soluble in hot alcohol (90 per cent V/V) and completely soluble in fatty and essential oils.

Relative density: about 0.960.

TESTS

Drop point (2.2.17): 61 °C to 66 °C.

Melt the beeswax by heating on a water-bath, pour onto a glass plate and allow to cool to a semi-solid mass. Fill the metal cup by inserting the wider end into the beeswax and repeating the procedure until beeswax extrudes from the narrow opening. Remove the excess with a spatula and insert the thermometer immediately. Remove the beeswax displaced. Allow to stand at room temperature for at least 12 h before determining the drop point.

Acid value: 17.0 to 24.0.

To 2.00 g (*m* g), in a 250 ml conical flask fitted with a reflux condenser, add 40 ml of *xylene R* and a few glass beads. Heat until the substance is dissolved. Add 20 ml of *alcohol R* and 0.5 ml of *phenolphthalein solution R1* and titrate the hot solution with 0.5 M *alcoholic potassium hydroxide* until a red colour persists for at least 10 s (n_1 ml). Carry out a blank test (n_2 ml).

$$\text{Acid value} = \frac{28.05 (n_1 - n_2)}{m}$$

Ester value (2.5.2): 70 to 80.

Saponification value: 87 to 104.

To 2.00 g (*m* g), in a 250 ml conical flask fitted with a reflux condenser, add 30 ml of a mixture of equal volumes of *alcohol R* and *xylene R* and a few glass beads. Heat until the substance is dissolved. Add 25.0 ml of 0.5 M *alcoholic potassium hydroxide* and heat under a reflux condenser for 3 h. Titrate the hot solution immediately with 0.5 M *hydrochloric acid*, using 1 ml of *phenolphthalein solution R1* as indicator (n_1 ml). Reheat the solution to boiling several times during the course of the titration. Carry out a blank test (n_2 ml).

$$\text{Saponification value} = \frac{28.05 (n_2 - n_1)}{m}$$

Ceresin, paraffins and certain other waxes. To 3.0 g, in a 100 ml round-bottomed flask, add 30 ml of a 40 g/l solution of *potassium hydroxide R* in *aldehyde-free alcohol R* and boil gently under a reflux condenser for 2 h. Remove the condenser and immediately insert a thermometer. Place the flask in a water-bath at 80 °C and allow to cool, swirling the solution continuously. No precipitate is formed until 65 °C, although the solution may be slightly opalescent. Above 65 °C, the solution may become cloudy and precipitates may be formed. At 59 °C, the solution is cloudy.

Glycerol and other polyols: maximum 0.5 per cent *m/m*, calculated as glycerol.

To 0.20 g add 10 ml of *alcoholic potassium hydroxide solution R* and heat on a water-bath under a reflux condenser for 30 min. Add 50 ml of *dilute sulphuric acid R*, cool and filter. Rinse the flask and the filter with *dilute sulphuric acid R*. Combine the filtrate and washings and dilute to 100.0 ml with *dilute sulphuric acid R*. Place 1.0 ml of the solution in a test-tube, add 0.5 ml of a 10.7 g/l solution of *sodium periodate R*, mix and allow to stand for 5 min. Add 1.0 ml of *decolorised fuchsin solution R* and mix. Any precipitate disappears. Place the tube in a beaker containing water at 40 °C. During cooling observe for 10-15 min. Any violet-blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 1.0 ml of a 10 mg/l solution of *glycerol R* in *dilute sulphuric acid R*.

01/2005:0070

BEESWAX, YELLOW**Cera flava****DEFINITION**

Wax obtained by melting the walls of the honeycomb made by the honey-bee, *Apis mellifera* L., with hot water and removing foreign matter.

CHARACTERS

Appearance: yellow or light brown pieces or plates with a fine-grained, matt and non-crystalline fracture; when warmed in the hand they become soft and malleable.

It has a faint odour, characteristic of honey. It is tasteless and does not stick to the teeth.

Solubility: practically insoluble in water, partially soluble in hot alcohol (90 per cent V/V) and completely soluble in fatty and essential oils.

Relative density: about 0.960.

TESTS

Drop point (2.2.17): 61 °C to 66 °C.

Melt the beeswax by heating on a water-bath, pour onto a glass plate and allow to cool to a semi-solid mass. Fill the metal cup by inserting the wider end into the beeswax and repeating the procedure until beeswax extrudes from the narrow opening. Remove the excess with a spatula and insert the thermometer immediately. Remove the beeswax displaced. Allow to stand at room temperature for at least 12 h before determining the drop point.

Acid value: 17.0 to 22.0.

To 2.00 g (*m* g), in a 250 ml conical flask fitted with a reflux condenser, add 40 ml of *xylene R* and a few glass beads. Heat until the substance is dissolved. Add 20 ml of *alcohol R* and 0.5 ml of *phenolphthalein solution R1* and titrate the hot solution with 0.5 M *alcoholic potassium hydroxide* until a red colour persists for at least 10 s (*n*₁ ml). Carry out a blank test (*n*₂ ml).

$$\text{Acid value} = \frac{28.05 (n_1 - n_2)}{m}$$

Ester value (2.5.2): 70 to 80.

Saponification value: 87 to 102.

To 2.00 g (*m* g), in a 250 ml conical flask fitted with a reflux condenser, add 30 ml of a mixture of equal volumes of *alcohol R* and *xylene R* and a few glass beads. Heat until the substance is dissolved. Add 25.0 ml of 0.5 M *alcoholic potassium hydroxide* and heat under a reflux condenser for 3 h. Titrate the hot solution immediately with 0.5 M *hydrochloric acid*, using 1 ml of *phenolphthalein solution R1* as indicator (*n*₁ ml). Reheat the solution to boiling several times during the course of the titration. Carry out a blank test (*n*₂ ml).

$$\text{Saponification value} = \frac{28.05 (n_2 - n_1)}{m}$$

Ceresin, paraffins and certain other waxes. To 3.0 g, in a 100 ml round-bottomed flask, add 30 ml of a 40 g/l solution of *potassium hydroxide R* in *aldehyde-free alcohol R* and boil gently under a reflux condenser for 2 h. Remove the condenser and immediately insert a thermometer. Place the flask in a water-bath at 80 °C and allow to cool, swirling the solution continuously. No precipitate is formed until 65 °C,

although the solution may be slightly opalescent. Above 65 °C, the solution may become cloudy and precipitates may be formed. At 59 °C, the solution is cloudy.

Glycerol and other polyols: maximum 0.5 per cent *m/m*, calculated as glycerol.

To 0.20 g add 10 ml of *alcoholic potassium hydroxide solution R* and heat on a water-bath under a reflux condenser for 30 min. Add 50 ml of *dilute sulphuric acid R*, cool and filter. Rinse the flask and the filter with *dilute sulphuric acid R*. Combine the filtrate and washings and dilute to 100.0 ml with *dilute sulphuric acid R*. Place 1.0 ml of the solution in a test-tube, add 0.5 ml of a 10.7 g/l solution of *sodium periodate R*, mix and allow to stand for 5 min. Add 1.0 ml of *decolorised fuchsin solution R* and mix. Any precipitate disappears. Place the tube in a beaker containing water at 40 °C. During cooling observe for 10-15 min. Any violet-blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 1.0 ml of a 10 mg/l solution of *glycerol R* in *dilute sulphuric acid R*.

01/2005:0221

BELLADONNA LEAF**Belladonnae folium****DEFINITION**

Belladonna leaf consists of the dried leaf or of the dried leaf and flowering, and occasionally fruit-bearing, tops of *Atropa belladonna* L. It contains not less than 0.30 per cent of total alkaloids, calculated as hyoscyamine (*M_r* 289.4) with reference to the drug dried at 100 °C to 105 °C. The alkaloids consist mainly of hyoscyamine together with small quantities of hyoscyne (scopolamine).

CHARACTERS

Belladonna leaf has a slightly nauseous odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- The leaves are green to brownish-green, slightly darker on the upper surface, often crumpled and rolled and partly matted together in the drug. The leaf is petiolate and the base of the lamina is acute and decurrent and the margin entire. The flowering stems are flattened and bear at each node a pair of leaves unequal in size, in the axils of which occur singly the flowers or occasionally fruits. The flowers have a gamosepalous calyx and campanulate corolla. The fruits are globular berries, green to brownish-black and surrounded by the persistent calyx with widely spread lobes.
- Reduce to a powder (355). The powder is dark green. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaf lamina showing sinuous-walled epidermal cells, a striated cuticle and numerous stomata predominantly present on the lower epidermis (anisocytic and also some anomocytic); multicellular uniseriate covering trichomes with smooth cuticle, glandular trichomes with unicellular heads and multicellular, uniseriate stalks or with multicellular heads and unicellular stalks; parenchyma cells including rounded cells containing microspheoidal crystals of calcium oxalate; annular and spirally thickened vessels. The powdered drug may also show the following: fibres and reticulately thickened vessels from the

stems; subspherical pollen grains, 40 µm to 50 µm in diameter, with three germinal pores, three furrows and an extensively pitted exine; fragments of the corolla, with a papillose epidermis or bearing numerous covering or glandular trichomes of the types previously described; brownish-yellow seed fragments containing irregularly sclerified and pitted cells of the testa.

- C. Shake 1 g of powdered drug with 10 ml of 0.05 M sulphuric acid for 2 min. Filter and add to the filtrate 1 ml of concentrated ammonia R and 5 ml of water R. Shake cautiously with 15 ml of ether R, avoiding formation of an emulsion. Separate the ether layer and dry over anhydrous sodium sulphate R. Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of fuming nitric acid R and evaporate to dryness on a water-bath. Add 10 ml of acetone R and, dropwise, a 30 g/l solution of potassium hydroxide R in alcohol R. A deep violet colour develops.
- D. Examine the chromatogram obtained in the chromatography test. The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

TESTS

Chromatography. Examine by thin-layer chromatography (2.2.27), using silica gel G R as the coating substance.

Test solution. To 0.6 g of powdered drug (180) add 15 ml of 0.05 M sulphuric acid, shake for 15 min and filter. Wash the filter with 0.05 M sulphuric acid until 20 ml of filtrate is obtained. To the filtrate add 1 ml of concentrated ammonia R and shake with two quantities, each of 10 ml, of peroxide-free ether R. If necessary, separate by centrifugation. Dry the combined ether layers over anhydrous sodium sulphate R, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of methanol R.

Reference solution. Dissolve 50 mg of hyoscyamine sulphate R in 9 ml of methanol R. Dissolve 15 mg of hyoscine hydrobromide R in 10 ml of methanol R. Mix 1.8 ml of the hyoscine hydrobromide solution and 8 ml of the hyoscyamine sulphate solution.

Apply separately to the plate as bands 20 mm by 3 mm 10 µl and 20 µl of each solution, leaving 1 cm between the bands. Develop over a path of 10 cm using a mixture of 3 volumes of concentrated ammonia R, 7 volumes of water R and 90 volumes of acetone R. Dry the plate at 100 °C to 105 °C for 15 min, allow to cool and spray with potassium iodobismuthate solution R2, using about 10 ml for a plate 200 mm square, until the orange or brown zones become visible against a yellow background. The zones in the chromatograms obtained with the test solution are similar to those in the chromatograms obtained with the reference solution with respect to their position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and their colour. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting-point in the chromatogram obtained with 10 µl of the test solution.

Spray the plate with sodium nitrite solution R until the coating is transparent. Examine after 15 min. The zones corresponding to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Foreign matter (2.8.2). Not more than 3 per cent of stem having a diameter exceeding 5 mm.

Total ash (2.4.16). Not more than 16.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 4.0 per cent

ASSAY

Take about 50 g of drug and completely reduce it to a powder (180). Using the powder, determine the loss on drying and the total alkaloids.

a) Determine the loss on drying (2.2.32) on 2.000 g, by drying in an oven at 100 °C to 105 °C.

b) Moisten 10.00 g of powder with a mixture of 5 ml of ammonia R, 10 ml of alcohol R and 30 ml of peroxide-free ether R and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of chloroform R and 3 volumes of peroxide-free ether R until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in 0.25 M sulphuric acid and verify the absence of alkaloids using potassium tetraiodomercurate solution R. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with peroxide-free ether R. Add a quantity of peroxide-free ether R equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than three quantities, each of 20 ml, of 0.25 M sulphuric acid, separate the two layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. Make the acid layer alkaline with ammonia R and shake with three quantities, each of 30 ml, of chloroform R. Combine the chloroform layers, add 4 g of anhydrous sodium sulphate R and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the sodium sulphate with three quantities, each of 10 ml, of chloroform R. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100 °C to 105 °C for 15 min. Dissolve the residue in a few millilitres of chloroform R, add 20.0 ml of 0.01 M sulphuric acid and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with 0.02 M sodium hydroxide using methyl red mixed solution R as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, from the expression:

$$\frac{57.88 \times (20 - n)}{(100 - d) \times m}$$

d = loss on drying as a percentage,

n = volume of 0.02 M sodium hydroxide used in millilitres,

m = mass of drug used in grams.

STORAGE

Store protected from light.

01/2005:1294

BELLADONNA LEAF DRY EXTRACT, STANDARDISED

Belladonnae folii extractum siccum normatum

DEFINITION

Standardised belladonna leaf dry extract is produced from *Belladonna leaf* (0221). It contains not less than 0.95 per cent and not more than 1.05 per cent of total alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$, M_r 289.4), with reference to the dried extract.

PRODUCTION

The extract is produced from the drug and ethanol (70 per cent V/V) using an appropriate procedure.

CHARACTERS

A hygroscopic brown or greenish powder.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. To 1 g of the extract to be examined add 5.0 ml of *methanol R*. Shake for 2 min and filter.

Reference solution. Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Apply to the plate, as bands, 20 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 10 volumes of *water R*, 30 volumes of *methyl ethyl ketone R* and 50 volumes of *ethyl acetate R*. Dry the plate at 100 °C to 105 °C and spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray the plate with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm. The chromatograms obtained with the reference solution and the test solution show in the central part a light blue fluorescent zone (chlorogenic acid) and in the lower part a yellowish-brown fluorescent zone (rutin). Furthermore, the chromatogram obtained with the test solution shows a little above the start a yellowish-brown fluorescent zone and directly above a yellow fluorescent zone, a yellow or yellowish-brown fluorescent zone between the zone due to rutin and the zone due to chlorogenic acid. Further zones may be present.

B. Examine the chromatogram obtained in the test for atropine. The principal zones in the chromatogram obtained with the test solution are similar in position and colour to the principal zones in the chromatogram obtained with the reference solution.

TESTS

Atropine. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. To 0.20 g of the extract to be examined add 10.0 ml of 0.05 M *sulphuric acid*, shake for 2 min and filter. Add 1.0 ml of *concentrated ammonia R* and shake with two quantities, each of 10 ml, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over about 2 g of *anhydrous sodium sulphate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution. Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscyne hydrobromide R* in 10 ml of *methanol R*. Mix 1.8 ml of the hyoscyne hydrobromide solution and 8 ml of the hyoscyamine sulphate solution.

Apply to the plate, as bands, 20 µl of each solution. Develop over a path of 10 cm using a mixture of 3 volumes of *concentrated ammonia R*, 7 volumes of *water R* and 90 volumes of *acetone R*. Dry the plate at 100 °C to 105 °C for 15 min, allow to cool and spray with *potassium iodobismuthate solution R2*, until the orange or brown zones become visible against a yellow background. The zones in the chromatogram obtained with the test solution are similar to those in the chromatogram obtained with the reference solution with respect to their position (hyoscyamine in the lower third, hyoscyne in the upper third of the chromatogram) and their colour. Other faint zones may be present in the chromatogram obtained with the test solution. Spray the plate with *sodium nitrite solution R* until the coating is transparent. Examine after 15 min. The zones corresponding to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from orange or brown to reddish-brown but not to greyish-blue (atropine).

Loss on drying (2.8.17): maximum 5.0 per cent.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^4 micro-organisms per gram of which not more than 10^2 fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and for *Salmonella* (2.6.13).

ASSAY

At each extraction stage it is necessary to check that the alkaloids have been completely extracted. If the extraction is into the organic phase this is done by evaporating to dryness a few millilitres of the last organic layer, dissolving the residue in 0.25 M *sulphuric acid* and verifying the absence of alkaloids using *potassium tetraiodomercurate solution R*. If the extraction is into the acid aqueous phase, this is done by taking a few millilitres of the last acid aqueous phase and verifying the absence of alkaloids using *potassium tetraiodomercurate solution R*.

Disperse 3.00 g in a mixture of 5 ml of *ammonia R* and 15 ml of *water R*. Shake with no fewer than three quantities, each of 40 ml of a mixture of 1 volume of *methylene chloride R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Concentrate the combined organic layers to about 50 ml by distilling on a water-bath and transfer the resulting liquid to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the liquid to produce a layer having a density well below that of water. Shake the resulting solution with no fewer than three quantities, each of 20 ml, of 0.25 M *sulphuric acid* until the alkaloids are completely extracted. Separate the layers by centrifugation, if necessary and transfer the acid layers to a second separating funnel. Make the combined acid layers alkaline with *ammonia R* and shake with no fewer than three quantities, each of 30 ml, of *methylene chloride R* until the alkaloids are completely extracted. Combine the organic layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the methylene chloride and wash the sodium sulphate with three quantities, each of 10 ml, of *methylene chloride R*. Combine the organic extracts, evaporate to dryness on a water-bath. Heat the residue in an oven at 100 °C to 105 °C for 15 min. Dissolve the residue in a few millilitres of *methylene chloride R*, evaporate to dryness on a water-bath

and again heat the residue in an oven at 100 °C to 105 °C for 15 min. Dissolve the residue in a few millilitres of *methylene chloride R*, add 20.0 ml of 0.01 M sulphuric acid and remove the methylene chloride by evaporation on a water-bath. Titrate the excess of acid with 0.02 M sodium hydroxide using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, from the expression:

$$\frac{57.88 \times (20 - n)}{100 \times m}$$

- n = volume of 0.02 M sodium hydroxide used, in millilitres,
 m = mass of the substance to be examined, in grams.

STORAGE

Store in an airtight container, protected from light.

01/2005:1812

BELLADONNA LEAF TINCTURE, STANDARDISED

Belladonnae folii tinctura normata

DEFINITION

Tincture produced from *Belladonna leaf* (0221).

Content: 0.027 per cent to 0.033 per cent of total alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4). The alkaloids consist mainly of hyoscyamine together with small quantities of hyoscyne.

PRODUCTION

The tincture is produced from 1 part of the powdered drug (355) and 10 parts of ethanol (70 per cent V/V) by a suitable procedure.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Evaporate to dryness 10.0 ml of the tincture to be examined in a water-bath at 40 °C under reduced pressure. Dissolve the residue in 1.0 ml of *methanol R*.

Reference solution. Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate: TLC silica gel plate R.

Mobile phase: *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 V/V/V/V).

Application: 40 µl, as bands.

Development: over a path of 15 cm.

Drying: at 100-105 °C.

Detection: spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; subsequently spray the plate with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid) A yellow or yellowish-brown fluorescent zone
Rutin: a yellowish-brown fluorescent zone	A bluish-grey fluorescent zone A yellow fluorescent zone A yellowish-brown fluorescent zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for atropine, detection A.

Results A: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 40 µl of the test solution or near the starting point in the chromatogram obtained with 20 µl of the test solution.

Top of the plate	
Hyoscyne: a brownish-orange zone	A brownish-orange zone (hyoscyne) Faint secondary zones
Hyoscyamine: a brownish-orange zone	A brownish-orange zone (hyoscyamine) Faint secondary zones
Reference solution	Test solution

TESTS

Atropine. Thin-layer chromatography (2.2.27).

Test solution. To 15.0 ml of the tincture to be examined add 15 ml of 0.05 M sulphuric acid. Filter. Add 1 ml of concentrated ammonia R to the filtrate and shake with 2 quantities, each of 10 ml, of peroxide-free ether R. Separate by centrifugation if necessary. Dry the combined ether layers over anhydrous sodium sulphate R. Filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution. Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscyne hydrobromide R* in 10 ml of *methanol R*. Mix 1.8 ml of the hyoscyne hydrobromide solution and 8 ml of the hyoscyamine sulphate solution.

Plate: TLC silica gel plate R.

Mobile phase: concentrated ammonia R, *water R*, *acetone R* (3:7:90 V/V/V).

Application: 20 µl and 40 µl of each solution, as bands.

Development: over a path of 10 cm.

Drying: at 100-105 °C for 15 min.

Detection A: spray with *potassium iodobismuthate solution R2*.

Detection B: spray with *sodium nitrite solution R* until the plate is transparent. Examine after 15 min.

Results B: the zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brownish-orange to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Ethanol (2.9.10): 64 per cent V/V to 69 per cent V/V.

ASSAY

Evaporate 50.0 g of the tincture to be examined to a volume of about 10 ml. Transfer quantitatively to a separating funnel, with the minimum volume of *alcohol (70 per cent V/V) R*. Add 5 ml of *ammonia R* and 15 ml of *water R*. Shake with not fewer than 3 quantities each of 40 ml of a mixture of 1 volume of *methylene chloride R* and 3 volumes of *peroxide-free ether R*, carefully to avoid emulsion, until the alkaloids are completely extracted. Combine the organic layers and concentrate the solution to a volume of about 50 ml by distilling on a water-bath. Transfer the resulting solution quantitatively to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the solution to produce a layer having a density well below that of water. Shake the resulting solution with not fewer than 3 quantities each of 20 ml of *0.25 M sulphuric acid* until the alkaloids are completely extracted. Separate the layers by centrifugation if necessary and transfer the layers to a separating funnel. Make the combined layers alkaline with *ammonia R* and shake with not fewer than 3 quantities each of 30 ml of *methylene chloride R* until the alkaloids are completely extracted. Combine the organic layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the methylene chloride and filter. Wash the sodium sulphate with 3 quantities each of 10 ml of *methylene chloride R*. Combine the organic extracts, evaporate to dryness on a water-bath. Heat the residue in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *methylene chloride R*, evaporate to dryness on a water-bath and heat the residue in an oven at 100-105 °C for 15 min again. Dissolve the residue in a few millilitres of *methylene chloride R*. Add 20.0 ml of *0.01 M sulphuric acid* and remove the methylene chloride by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator. Calculate the percentage content of total alkaloids, expressed as hyoscyamine, from the expression:

$$\frac{57.88 \times (20 - n)}{100 \times m}$$

n = volume of *0.02 M sodium hydroxide* used, in millilitres,

m = mass of drug used, in grams.

01/2005:0222

BELLADONNA, PREPARED

Belladonnae pulvis normatus

DEFINITION

Prepared belladonna is belladonna leaf powder (180) adjusted if necessary by adding powdered lactose or belladonna leaf powder with a lower alkaloidal content to contain 0.28 per cent to 0.32 per cent of total alkaloids, calculated as hyoscyamine (M_r 289.4) with reference to the dried drug.

CHARACTERS

Slightly nauseous odour.

IDENTIFICATION

- The powder is dark green. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaf lamina showing sinuous-walled epidermal cells, a striated cuticle and numerous stomata predominantly present on the lower epidermis (anisocytic and also some anomocytic); multicellular uniseriate covering trichomes with smooth cuticle, glandular trichomes with unicellular heads and multicellular, uniseriate stalks or with multicellular heads and unicellular stalks; parenchyma cells including rounded cells containing microsphenoidal crystals of calcium oxalate; annular and spirally thickened vessels. The powdered drug may also show the following: fibres and reticulately thickened vessels from the stems; subspherical pollen grains, 40 µm to 50 µm in diameter, with three germinal pores, three furrows and an extensively pitted exine; fragments of the corolla, with a papillose epidermis or bearing numerous covering or glandular trichomes of the types previously described; brownish-yellow seed fragments containing irregularly sclerified and pitted cells of the testa. Examined in *glycerol (85 per cent) R*, it may be seen to contain lactose crystals.
- Shake 1 g with 10 ml of *0.05 M sulphuric acid* for 2 min. Filter and add to the filtrate 1 ml of *concentrated ammonia R* and 5 ml of *water R*. Shake cautiously with 15 ml of *ether R*, avoiding formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulphate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of *fuming nitric acid R* and evaporate to dryness on a water-bath. Add 10 ml of *acetone R* and, dropwise, a 30 g/l solution of *potassium hydroxide R* in *alcohol R*. A deep violet colour develops.
- Examine the chromatogram obtained in the chromatography test. The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

TESTS

Chromatography. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. To 0.6 g add 15 ml of *0.05 M sulphuric acid*, shake for 15 min and filter. Wash the filter with *0.05 M sulphuric acid* until 20 ml of filtrate is obtained. To the filtrate add 1 ml of *concentrated ammonia R* and shake with two quantities, each of 10 ml, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulphate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution. Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R*. Mix 1.8 ml of the hyoscine hydrobromide solution and 8 ml of the hyoscyamine sulphate solution.

Apply separately to the plate as bands 20 mm by 3 mm 10 µl and 20 µl of each solution, leaving 1 cm between the bands. Develop over a path of 10 cm using a mixture of 3 volumes of *concentrated ammonia R*, 7 volumes of *water R* and 90 volumes of *acetone R*. Dry the plate at 100 °C to 105 °C for 15 min, allow to cool and spray with *potassium iodobismuthate solution R2*, using about

10 ml for a plate 200 mm square, until the orange or brown zones become visible against a yellow background. The zones in the chromatograms obtained with the test solution are similar to those in the chromatograms obtained with the reference solution with respect to their position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and their colour. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting-point in the chromatogram obtained with 10 µl of the test solution. Spray the plate with *sodium nitrite solution R* until the coating is transparent. Examine after 15 min. The zones corresponding to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Total ash (2.4.16). Not more than 16.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 4.0 per cent.

ASSAY

a) Determine the loss on drying (2.2.32) on 2.000 g, by drying in an oven at 100 °C to 105 °C.

b) Moisten 10.00 g with a mixture of 5 ml of *ammonia R*, 10 ml of *alcohol R* and 30 ml of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in 0.25 M sulphuric acid and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than three quantities, each of 20 ml, of 0.25 M sulphuric acid, separate the two layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. Make the acid layer alkaline with *ammonia R* and shake with three quantities, each of 30 ml, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the sodium sulphate with three quantities, each of 10 ml, of *chloroform R*. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100 °C to 105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 20.0 ml of 0.01 M sulphuric acid and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with 0.02 M sodium hydroxide using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, from the expression:

$$\frac{57.88 \times (20 - n)}{(100 - d) \times m}$$

d = loss on drying as a percentage,

n = volume of 0.02 M sodium hydroxide used in millilitres,

m = mass of drug used in grams.

STORAGE

Store in an airtight container, protected from light.

01/2005:0370

BENDROFLUMETHIAZIDE

Bendroflumethiazidum

C₁₅H₁₄F₃N₃O₄S₂

M_r 421.4

DEFINITION

Bendroflumethiazide contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 3-benzyl-3,4-dihydro-6-(trifluoromethyl)-2*H*-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone, soluble in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bendroflumethiazide CRS*. Examine the substances prepared in the form of discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with 4 µl of the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- In a test-tube, heat 0.5 ml of a saturated solution of *chromic acid cleansing mixture R* in a naked flame until white fumes appear in the upper part of the tube. The solution wets the side of the tube and there is no appearance of greasiness. Add about 2 mg of the substance to be examined and heat again in a naked flame until white fumes appear. The solution does not wet the side of the tube and does not pour easily from the tube.
- Heat about 5 mg with a mixture of 5 ml of *potassium permanganate solution R* and 1 ml of *sulphuric acid R*. An odour of benzaldehyde is produced.

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *bendroflumethiazide CRS* in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with *acetone R*.

Apply separately to the plate 4 µl and 20 µl of the test solution, 4 µl of reference solution (a) and 20 µl of reference solution (b). Develop over a path of 15 cm using *ethyl acetate R*. Dry the plate in a current of air for 10 min and spray with a mixture of equal volumes of *alcoholic solution of sulphuric acid R* and *alcohol R*; use about 10 ml for a plate 200 mm square and spray in small portions, allowing the solvent to evaporate each time to avoid excessive wetting. Heat at 100 °C to 105 °C for 30 min and immediately place the plate above, but not in contact with, 10 ml of a saturated solution of *sodium nitrite R* in a glass tank. Carefully add 0.5 ml of *sulphuric acid R* to the sodium nitrite solution, close the tank, and allow to stand for 15 min. Remove the plate, heat in a ventilated oven at 40 °C for 15 min and spray with three quantities, each of 5 ml, of a freshly prepared 5 g/l solution of *naphthylethylenediamine dihydrochloride R* in *alcohol R*. Examine the plate by transmitted light. Any spot in the chromatogram obtained with 20 µl of the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g

ASSAY

Dissolve 0.200 g in 50 ml of *anhydrous pyridine R*. Titrate with 0.1 M *tetrabutylammonium hydroxide*, determining the end-point potentiometrically at the second point of inflexion (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 21.07 mg of $C_{15}H_{14}F_3N_3O_4S_2$.

01/2005:1601
corrected

BENFLUOREX HYDROCHLORIDE

Benfluorexi hydrochloridum

$C_{19}H_{21}ClF_3NO_2$

M_r 387.8

DEFINITION

2-[[[(1*S*)-1-Methyl-2-[3-(trifluoromethyl)phenyl]ethyl]amino]ethyl benzoate hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: slightly soluble in water, freely soluble in methanol, soluble in methylene chloride, sparingly soluble or soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: mulls in *liquid paraffin R*.

Comparison: *benfluorex hydrochloride CRS*.

If the spectra obtained show differences, heat the substance to be examined and the reference substance separately in an oven at 150 °C for 3 h and record new spectra.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Optical rotation (2.2.7): -0.10° to $+0.10^\circ$.

Dissolve 0.2 g in *ethanol R* and dilute to 20.0 ml with the same solvent.

Impurity B. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dissolve 0.30 g of the substance to be examined in *methylene chloride R* and dilute to 20 ml with the same solvent. Transfer to a separating funnel, add 10 ml of a 40 g/l solution of *sodium hydroxide R*. Shake the flask vigorously and allow the phases to separate. Collect the organic layer.

Reference solution. Dissolve 0.30 g of *benfluorex hydrochloride for system suitability CRS* in *methylene chloride R* and dilute to 20 ml with the same solvent. Transfer to a separating funnel and add 10 ml of a 40 g/l solution of *sodium hydroxide R*. Shake the flask vigorously and allow the phases to separate. Collect the organic layer.

Column:

- **material:** fused silica,
- **size:** $l = 25$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** macrogol 20 000 R (film thickness 0.2 µm).

Carrier gas: *hydrogen for chromatography R*.

Linear velocity: 75 cm/s.

Split ratio: 1:35.

Temperature:

- **column:** 220 °C,
- **injection port and detector:** 250 °C.

Detection: flame ionisation.

Injection: 1 µl.

Run time: 1.5 times the retention time of benfluorex.

Relative retention with reference to benfluorex (retention time = about 4.5 min): **impurity B** = about 1.1.

System suitability:

- **peak-to-valley ratio:** minimum 2.5, where H_p = height above the baseline of the peak due to impurity B, and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to benfluorex.

Limit:

- **impurity B:** maximum 0.1 per cent.

Related substances, other than impurity B. Liquid chromatography (2.2.29).

Test solution. Dissolve 60.0 mg of the substance to be examined in 50 ml of *acetonitrile R* and dilute to 100.0 ml with *water R*.

Reference solution (a). Dissolve 60.0 mg of *benfluorex hydrochloride for system suitability CRS* in 50 ml of *acetonitrile R* and dilute to 100.0 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*. Dilute 5.0 ml of this solution to 50.0 ml with the same mixture of solvents.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** silica gel bonded with alkylamide groups (5 μ m),
- **temperature:** 60 °C.

Mobile phase: a mixture of equal volumes of *acetonitrile R* and a solution containing 2.18 g/l of *potassium dihydrogen phosphate R* adjusted to pH 2.5 with *phosphoric acid R* and 6.5 g/l of *sodium decyl sulphate R*.

Flow rate: 1.4 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 μ l.

Run time: 3 times the retention time of *benfluorex*.

Relative retention with reference to *benfluorex* (retention time = about 5 min): impurity A = about 0.9.

System suitability:

- **signal-to-noise ratio:** minimum 20 for the principal peak in the chromatogram obtained with reference solution (b),
- **peak-to-valley ratio:** minimum 2.5, where H_p = height above the baseline of the peak due to impurity A, and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to *benfluorex* in the chromatogram obtained with reference solution (a).

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.250 g rapidly in 2.0 ml of *anhydrous formic acid R* and add 50.0 ml of *acetic anhydride R*. Titrate immediately with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 38.78 mg of $C_{19}H_{21}ClF_3NO_2$.

IMPURITIES

- A. R = CF_3 , R' = H: 2-[[[(1*RS*)-1-methyl-2-[2-(trifluoromethyl)phenyl]ethyl]amino]ethyl benzoate,
- B. R = H, R' = CF_3 : 2-[[[(1*RS*)-1-methyl-2-[4-(trifluoromethyl)phenyl]ethyl]amino]ethyl benzoate,

C. benzoic acid,

- D. R = CH_2CH_2OH , R' = H: 2-[[[(1*RS*)-1-methyl-2-[3-(trifluoromethyl)phenyl]ethyl]amino]ethanol,
- E. R = CH_2CH_2OH , R' = $CO-C_6H_5$: *N*-(2-hydroxyethyl)-*N*[[[(1*RS*)-1-methyl-2-[3-(trifluoromethyl)phenyl]ethyl]amino]ethyl]benzamide,
- F. R = $CH_2CH_2O-CO-C_6H_5$, R' = $CO-C_6H_5$: 2-[benzoyl[(1*RS*)-1-methyl-2-[3-(trifluoromethyl)phenyl]ethyl]amino]ethyl benzoate.

01/2005:1172

BENPERIDOL

Benperidolum

$C_{22}H_{24}FN_3O_2$

M_r 381.4

DEFINITION

Benperidol contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-[1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl]-1,3-dihydro-2*H*-benzimidazol-2-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in dimethylformamide, soluble in methylene chloride, slightly soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *benperidol CRS*. Examine the substances prepared as discs. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the

reference substance separately in the minimum volume of *methyl isobutyl ketone R*, evaporate to dryness and record new spectra using the residues.

- B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 30 mg of the substance to be examined in a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 30 mg of *benperidol CRS* in a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 30 mg of *benperidol CRS* and 30 mg of *droperidol CRS* in a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Dissolve about 10 mg in 5 ml of *ethanol R*. Add 0.5 ml of *dinitrobenzene solution R* and 0.5 ml of *2 M alcoholic potassium hydroxide R*. A violet colour is produced which becomes brownish-red after 20 min.
- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 0.10 g of the substance to be examined in *dimethylformamide R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *benperidol CRS* and 2.5 mg of *droperidol CRS* in *dimethylformamide R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *dimethylformamide R*. Dilute 5.0 ml of this solution to 20.0 ml with *dimethylformamide R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min:

Mobile phase A. A 10 g/l solution of *tetrabutylammonium hydrogen sulphate R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	100 → 60	0 → 40	linear gradient
15 - 20	60	40	isocratic elution
20 - 25	100	0	switch to initial eluent composition
25 = 0	100	0	restart gradient

– as detector a spectrophotometer set at 275 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate with the initial eluent composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: *benperidol* about 6.5 min and *droperidol* about 7 min. The test is not valid unless the resolution between the peaks corresponding to *benperidol* and *droperidol* is at least 2.0. If necessary, adjust the concentration of *acetonitrile* in the mobile phase or adjust the time programme for the linear gradient.

Inject 10 µl of *dimethylformamide R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak obtained with the blank and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with 0.1 M *perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 38.14 mg of $C_{22}H_{24}FN_3O_2$.

STORAGE

Store protected from light.

IMPURITIES

A. 1-(piperidin-4-yl)-1,3-dihydro-2H-benzimidazol-2-one,

- B. 1-[1-[4-(2-fluorophenyl)-4-oxobutyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

- C. 1-[1-[4-oxo-4-[4-[4-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)piperidin-1-yl]phenyl]butyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

- D. *cis*-1-[1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl]-1-oxide]-1,3-dihydro-2H-benzimidazol-2-one,

- E. *trans*-1-[1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl]-1-oxide]-1,3-dihydro-2H-benzimidazol-2-one.

01/2005:1173

BENSERAZIDE HYDROCHLORIDE

Benserazidi hydrochloridum

C₁₀H₁₆ClN₃O₅M_r 293.7

DEFINITION

Benserazide hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-2-amino-3-hydroxy-2'-(2,3,4-trihydroxybenzyl)propanohydrazide hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or yellowish-white or orange-white, crystalline powder, freely soluble in water, very slightly soluble in ethanol, practically insoluble in acetone.

It shows polymorphism.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *benserazide hydrochloride CRS*. Examine the substances prepared as discs. If the spectra obtained show

differences, dissolve the substance to be examined and the reference substance separately in hot *methanol R*, evaporate to dryness and record new spectra using the residues.

- B. Solution S (see Tests) gives reaction (b) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 4.0 to 5.0.

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is −0.05 to +0.05.

Related substances. Examine by liquid chromatography (2.2.29).

Prepare the solutions using the mobile phase cooled to 4 °C and inject immediately.

Test solution. Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. Dissolve 5.0 mg of *benserazide impurity A CRS* and 5.0 mg of *benserazide hydrochloride CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.2 ml/min a mixture prepared as follows: dissolve 4.76 g of *potassium dihydrogen phosphate R* in 800 ml of *water R*; add 200 ml of *acetonitrile R* and 1.22 g of *sodium decanesulphonate R*; adjust to pH 3.5 with *phosphoric acid R*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of the reference solution. The test is not valid unless the resolution between the peaks corresponding to impurity A (first peak) and benserazide (second peak) is at least 2.0.

Inject 20 µl of the test solution. Continue the chromatography for nine times the retention time of benserazide. In the chromatogram obtained with the test solution: the area of any peak due to impurity A is not greater than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.5 per cent); the area of any peak, apart from the principal peak and any peak due to impurity A, is not greater than the area of the peak due to benserazide in the chromatogram obtained with the reference solution (0.5 per cent); the sum of the areas of any such peaks is not greater than twice the area of the peak due to benserazide in the chromatogram obtained with the reference solution (1 per cent). Disregard any peak with an area less than 0.1 times that of the peak due to benserazide in the chromatogram obtained with the reference solution.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 1.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating during the titration, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.250 g in 5 ml of *anhydrous formic acid R*. Add 70 ml of *anhydrous acetic acid R*. Titrate immediately with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 29.37 mg of $C_{10}H_{16}ClN_3O_5$.

STORAGE

Store protected from light.

IMPURITIES

A. (RS)-2-amino-3-hydroxypropanohydrazide,

B. (RS)-2-amino-3-hydroxy-2',2'-bis(2,3,4-trihydroxybenzyl)propanohydrazide,

C. (RS)-2-amino-3-hydroxy-2'-(2,3,4-trihydroxybenzylidene)propanohydrazide.

01/2005:0467

BENTONITE

Bentonitum

DEFINITION

Bentonite is a natural clay containing a high proportion of montmorillonite, a native hydrated aluminium silicate in which some aluminium and silicon atoms may be replaced by other atoms such as magnesium and iron.

CHARACTERS

A very fine, homogeneous, greyish-white powder with a more or less yellowish or pinkish tint, practically insoluble in water and in aqueous solutions. It swells with a little water forming a malleable mass.

IDENTIFICATION

A. To 0.5 g in a metal crucible add 1 g of *potassium nitrate R* and 3 g of *sodium carbonate R* and heat until the mixture melts. Allow to cool. To the residue add 20 ml of boiling *water R*, mix and filter. Wash the residue with 50 ml of *water R*. To the residue add 1 ml of *hydrochloric acid R*

and 5 ml of *water R*. Filter. To the filtrate add 1 ml of *strong sodium hydroxide solution R* and filter. To the filtrate add 3 ml of *ammonium chloride solution R*. A gelatinous white precipitate is formed.

B. It complies with the test for swelling power with water (see Tests).

C. 0.25 g gives the reaction of silicates (2.3.1).

TESTS

Alkalinity. To 2 g add 100 ml of *carbon dioxide-free water R* and shake for 5 min. To 5 ml of the suspension add 0.1 ml of *thymolphthalein solution R*. The liquid becomes bluish. Add 0.1 ml of 0.1 M *hydrochloric acid*. The liquid is decolourised within 5 min.

Coarse particles. To 20 g add 1000 ml of *water R* and mix for 15 min using a high-speed mixer capable of operating at not less than 5000 r/min. Transfer to a wet sieve (75), tared after drying at 100 °C to 105 °C. Wash with three quantities, each of 500 ml, of *water R*, ensuring that any agglomerates have been dispersed. Dry at 100 °C to 105 °C and weigh. The particles on the sieve weigh not more than 0.1 g (0.5 per cent).

Sedimentation volume. To 6.0 g add 200 ml of *water R* and mix for 20 min using a high-speed mixer capable of operating at 10 000 r/min. Transfer 100 ml of the suspension to a graduated cylinder. Allow to stand for 24 h. The volume of the clear supernatant liquid is not greater than 2 ml.

Swelling power with water. Add 2.0 g in twenty portions to 100 ml of a 10 g/l solution of *sodium laurilsulfate R* in a 100 ml graduated cylinder about 30 mm in diameter. Allow 2 min between additions for each portion to settle. Allow to stand for 2 h. The apparent volume of the sediment is not less than 22 ml.

Heavy metals (2.4.8). To 5.0 g add 7.5 ml of *dilute hydrochloric acid R* and 27.5 ml of *water R*. Boil for 5 min. Centrifuge and filter the supernatant liquid. Wash the centrifugation residue with *water R* and filter. Dilute the combined filtrates to 50.0 ml with *water R*. To 5 ml of the solution add 5 ml of *water R*, 10 ml of *hydrochloric acid R* and 25 ml of *methyl isobutyl ketone R* and shake for 2 min. Separate the layers. Evaporate the aqueous layer to dryness on a water-bath. Dissolve the residue in 1 ml of *acetic acid R*, dilute to 25 ml with *water R* and filter. 12 ml of the filtrate complies with limit test A for heavy metals (50 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 15 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^3 micro-organisms per gram, determined by plate-count.

01/2005:0372

BENZALKONIUM CHLORIDE

Benzalkonii chloridum

DEFINITION

Benzalkonium chloride is a mixture of alkylbenzyltrimethylammonium chlorides, the alkyl groups having chain lengths of C_8 to C_{18} . It contains not less than 95.0 per cent and not more than the equivalent of 104.0 per cent of alkylbenzyltrimethylammonium chlorides, calculated as $C_{22}H_{40}ClN$ (M_r 354.0) with reference to the anhydrous substance.

CHARACTERS

A white or yellowish-white powder or gelatinous, yellowish-white fragments, hygroscopic, soapy to the touch, very soluble in water and in alcohol. On heating it forms a clear molten mass. An aqueous solution froths copiously when shaken.

IDENTIFICATION

- A. Dissolve 80 mg in *water R* and dilute to 100 ml with the same solvent. Examined between 220 nm and 350 nm (2.2.25), the solution shows three absorption maxima, at 257 nm, 263 nm and 269 nm, and a shoulder at about 250 nm.
- B. To 2 ml of solution S (see Tests) add 0.1 ml of *glacial acetic acid R* and, dropwise, 1 ml of *sodium tetraphenylborate solution R*. A white precipitate is formed. Filter. Dissolve the precipitate in a mixture of 1 ml of *acetone R* and 5 ml of *alcohol R*, heating to not more than 70 °C. Add *water R* dropwise to the warm solution until a slight opalescence forms. Heat gently until the solution is clear and allow to cool. White crystals separate. Filter, wash with three quantities, each of 10 ml, of *water R* and dry *in vacuo* over *diphosphorus pentoxide R* or *anhydrous silica gel R* at a temperature not exceeding 50 °C. The crystals melt (2.2.14) at 127 °C to 133 °C.
- C. To 5 ml of *dilute sodium hydroxide solution R* add 0.1 ml of *bromophenol blue solution R1* and 5 ml of *chloroform R* and shake. The chloroform layer is colourless. Add 0.1 ml of solution S and shake. The chloroform layer becomes blue.
- D. To 2 ml of solution S add 1 ml of *dilute nitric acid R*. A white precipitate is formed which dissolves on the addition of 5 ml of *alcohol R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Acidity or alkalinity. To 50 ml of solution S add 0.1 ml of *bromocresol purple solution R*. Not more than 0.1 ml of 0.1 M *hydrochloric acid* or 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Amines and amine salts. Dissolve 5.0 g with heating in 20 ml of a mixture of 3 volumes of 1 M *hydrochloric acid* and 97 volumes of *methanol R* and add 100 ml of 2-propanol *R*. Pass a stream of *nitrogen R* slowly through the solution. Gradually add 12.0 ml of 0.1 M *tetrabutylammonium hydroxide* and record the potentiometric titration curve (2.2.20). If the curve shows two points of inflexion, the volume of titrant added between the two points is not greater than 5.0 ml. If the curve shows no point of inflexion, the substance to be examined does not comply with the test. If the curve shows one point of inflexion, repeat the test but add 3.0 ml of a 25.0 g/l solution of *dimethyldecylamine R* in 2-propanol *R* before the titration. If the titration curve after addition of 12.0 ml of the titrant shows only one point of inflexion, the substance to be examined does not comply with the test.

Water (2.5.12). Not more than 10 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 2.00 g in *water R* and dilute to 100.0 ml with the same solvent. Transfer 25.0 ml of the solution to a separating funnel, add 25 ml of *chloroform R*, 10 ml of 0.1 M *sodium hydroxide* and 10.0 ml of a freshly prepared 50 g/l solution of *potassium iodide R*. Shake well, allow to separate and discard the chloroform layer. Shake the aqueous layer with three quantities, each of 10 ml, of *chloroform R* and discard the chloroform layers. To the aqueous layer add 40 ml of *hydrochloric acid R*, allow to cool and titrate with 0.05 M *potassium iodate* until the deep-brown colour is almost discharged. Add 2 ml of *chloroform R* and continue the titration, shaking vigorously, until the chloroform layer no longer changes colour. Carry out a blank titration on a mixture of 10.0 ml of the freshly prepared 50 g/l solution of *potassium iodide R*, 20 ml of *water R* and 40 ml of *hydrochloric acid R*.

1 ml of 0.05 M *potassium iodate* is equivalent to 35.4 mg of C₂₂H₄₀ClN.

01/2005:0371

BENZALKONIUM CHLORIDE
SOLUTION

Benzalkonii chloridi solutio

DEFINITION

Benzalkonium chloride solution is an aqueous solution of a mixture of alkylbenzyltrimethylammonium chlorides, the alkyl groups having chain lengths of C₈ to C₁₈. Benzalkonium chloride solution contains not less than 475 g/l and not more than 525 g/l of alkylbenzyltrimethylammonium chlorides, calculated as C₂₂H₄₀ClN (*M_r* 354.0). The solution may contain alcohol.

CHARACTERS

A clear, colourless or slightly yellowish liquid, miscible with water and with alcohol. It froths copiously when shaken.

IDENTIFICATION

- A. Dilute 0.3 ml to 100 ml with *water R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows three absorption maxima, at 257 nm, 263 nm and 269 nm, and a shoulder at about 250 nm.
- B. To 0.05 ml add 2 ml of *water R*, 0.1 ml of *glacial acetic acid R* and, dropwise, 1 ml of *sodium tetraphenylborate solution R*. A white precipitate is formed. Filter. Dissolve the precipitate in a mixture of 1 ml of *acetone R* and 5 ml of *alcohol R*, heating to not more than 70 °C. Add *water R* dropwise to the warm solution until a slight opalescence forms. Heat gently until the solution is clear and allow to cool. White crystals separate. Filter, wash with three quantities, each of 10 ml, of *water R* and dry *in vacuo* over *diphosphorus pentoxide R* or *anhydrous silica gel R* at a temperature not exceeding 50 °C. The crystals melt (2.2.14) at 127 °C to 133 °C.
- C. To 5 ml of *dilute sodium hydroxide solution R* add 0.1 ml of *bromophenol blue solution R1* and 5 ml of *chloroform R* and shake. The chloroform layer is colourless. Add 0.05 ml of the solution to be examined and shake. The chloroform layer becomes blue.
- D. To 0.05 ml add 1 ml of *dilute nitric acid R*. A white precipitate is formed which dissolves on the addition of 5 ml of *alcohol R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dilute 2.0 g to 100 ml with *carbon dioxide-free water R*.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Acidity or alkalinity. To 50 ml of solution S add 0.1 ml of *bromocresol purple solution R*. Not more than 0.1 ml of 0.1 M *hydrochloric acid* or 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Amines and amine salts. Mix 10.0 g, while heating, with 20 ml of a mixture of 3 volumes of 1 M *hydrochloric acid* and 97 volumes of *methanol R* and add 100 ml of 2-propanol *R*. Pass a stream of *nitrogen R* slowly through the solution. Gradually add 12.0 ml of 0.1 M *tetrabutylammonium hydroxide* and record the potentiometric titration curve (2.2.20). If the curve shows two points of inflexion, the volume of titrant added between the two points is not greater than 5.0 ml. If the curve shows no point of inflexion, the solution to be examined does not comply with the test. If the curve shows one point of inflexion, repeat the test but add 3.0 ml of a 25.0 g/l solution of *dimethyldecylamine R* in 2-propanol *R* before the titration. If the titration curve after the addition of 12.0 ml of the titrant shows only one point of inflexion, the solution to be examined does not comply with the test.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Determine the density (2.2.5) of the solution to be examined. Dilute 4.00 g to 100.0 ml with *water R*. Transfer 25.0 ml of the solution to a separating funnel, add 25 ml of *chloroform R*, 10 ml of 0.1 M *sodium hydroxide* and 10.0 ml of a freshly prepared 50 g/l solution of *potassium iodide R*. Shake well, allow to separate and discard the chloroform layer. Shake the aqueous layer with three quantities, each of 10 ml, of *chloroform R* and discard the chloroform layers. To the aqueous layer add 40 ml of *hydrochloric acid R*, allow to cool and titrate with 0.05 M *potassium iodate* until the deep-brown colour is almost discharged. Add 2 ml of *chloroform R* and continue the titration, shaking vigorously, until the chloroform layer no longer changes colour. Carry out a blank titration on a mixture of 10.0 ml of the freshly prepared 50 g/l solution of *potassium iodide R*, 20 ml of *water R* and 40 ml of *hydrochloric acid R*.

1 ml of 0.05 M *potassium iodate* is equivalent to 35.4 mg of C₂₂H₄₀ClN.

LABELLING

The label states the content of alcohol, if any.

DEFINITION

Benzbromarone contains not less than 98.0 and not more than the equivalent of 101.0 per cent of (3,5-dibromo-4-hydroxyphenyl)(2-ethylbenzofuran-3-yl)methanone, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone and in methylene chloride, sparingly soluble in alcohol.

It melts at about 152 °C.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of benzbromarone*.
- By means of a copper wire, previously ignited, introduce a small amount of the substance into the non-illuminated part of a flame. The colour of the flame becomes green.

TESTS

Appearance of solution. Dissolve 1.25 g in *dimethylformamide R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, Method II).

Acidity or alkalinity. Shake 0.5 g with 10 ml of *carbon dioxide-free water R* for 1 min and filter. To 2.0 ml of the filtrate add 0.1 ml of *methyl red solution R* and 0.1 ml of 0.01 M *hydrochloric acid*. The solution is red. Add 0.3 ml of 0.01 M *sodium hydroxide*. The solution is yellow.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.125 g of the substance in 30 ml of *methanol R* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100 ml with the mobile phase. Dilute 1 ml of this solution to 10 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *benzarone CRS* in the mobile phase and dilute to 20 ml with the mobile phase.

Reference solution (c). To 5 ml of reference solution (b) add 1 ml of the test solution and dilute to 100 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 5 volumes of *glacial acetic acid R*, 25 volumes of *acetonitrile R*, 300 volumes of *water R* and 990 volumes of *methanol R*,
- as detector a spectrophotometer set at 231 nm.

Inject 20 µl of reference solution (c). Adjust the sensitivity of the system so that the heights of the principal peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the first peak (impurity C) and the second peak (benzbromarone) is at least 10.0.

Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography of the test solution for 2.5 times the retention time of benzbromarone. If peaks other than the principal peak are observed in the chromatogram obtained with the test solution, these may be due to impurity A or to impurity B. When the

BENZBROMARONE

Benzbromaronum

C₁₇H₁₂Br₂O₃

M_r 424.1

chromatograms are recorded in the prescribed conditions, the relative retention times are: impurity A about 0.6 and impurity B about 2.

In the chromatogram obtained with the test solution: the area of the peak corresponding to impurity A is not greater than four times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent); the area of the peak corresponding to impurity B is not greater than ten times the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent); the area of any peak, apart from the principal peak and the peaks corresponding to impurity A and impurity B, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Disregard any peak with an area less than 0.2 times that of the principal peak in the chromatogram obtained with reference solution (a).

Halides expressed as chlorides (2.4.4). Shake 1.25 g of the substance to be examined with a mixture of 5 ml of *dilute nitric acid R* and 15 ml of *water R*. Filter. Rinse the filter with *water R* and dilute the filtrate to 25 ml with the same solvent. Dilute 2.5 ml to 15 ml with *water R*. The solution obtained complies with the limit test for chlorides (400 ppm).

Iron (2.4.9). Moisten the residue obtained in the test for sulphated ash with 2 ml of *hydrochloric acid R* and evaporate to dryness on a water-bath. Add 0.05 ml of *hydrochloric acid R* and 10 ml of *water R* and heat until boiling for 1 min. Allow to cool. Rinse the crucible with *water R*, collect the rinsings and dilute to 25 ml with *water R*. Dilute 2 ml of this solution to 10 ml with *water R*. The solution complies with the limit test for iron (125 ppm).

Heavy metals (2.4.8). 0.5 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 50 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 60 ml of *methanol R*. Stir until completely dissolved and add 10 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 42.41 mg of $C_{17}H_{12}Br_2O_3$.

STORAGE

Store protected from light.

IMPURITIES

A. R1 = R2 = H, R3 = Br: (3-bromo-4-hydroxyphenyl)(2-ethylbenzofuran-3-yl)methanone,

B. R1 = R2 = R3 = Br: (6-bromo-2-ethylbenzofuran-3-yl)(3,5-dibromo-4-hydroxyphenyl)methanone,

C. R1 = R2 = R3 = H: (2-ethylbenzofuran-3-yl)(4-hydroxyphenyl)methanone (benzarone).

01/2005:0974

BENZETHONIUM CHLORIDE

Benzethonii chloridum

$C_{27}H_{42}ClNO_2$

M_r 448.1

DEFINITION

Benzethonium chloride contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of *N*-benzyl-*N,N*-dimethyl-2-[2-[4-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethanaminium chloride, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, very soluble in water and in alcohol, freely soluble in methylene chloride.

An aqueous solution froths copiously when shaken.

IDENTIFICATION

A. Melting point (2.2.14): 158 °C to 164 °C, after drying at 105 °C for 4 h.

B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 25 mg of *benzethonium chloride CRS* in *water R* and dilute to 5 ml with the same solvent.

Apply to the plate 20 µl of each solution. Develop over a path of 12 cm using a mixture of 5 volumes of *water R*, 5 volumes of *glacial acetic acid R* and 100 volumes of *methanol R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. To 5 ml of *dilute sodium hydroxide solution R* add 0.1 ml of *bromophenol blue solution R1* and 5 ml of *methylene chloride R* and shake. The lower layer is colourless. Add 0.1 ml of solution S (see Tests) and shake. A blue colour develops in the lower layer.

D. To 2 ml of solution S add 1 ml of *dilute nitric acid R*. A white precipitate is formed which dissolves upon addition of 5 ml of *alcohol R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Acidity or alkalinity. To 25 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Add 0.3 ml of 0.01 M *sodium hydroxide*. The solution is pink. Add 0.1 ml of *methyl red solution R* and 0.5 ml of 0.01 M *hydrochloric acid*. The solution is orange-red.

Volatile bases and salts of volatile bases (2.4.1). 0.20 g complies with limit test B for ammonium (50 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH₄) R*. Replace heavy magnesium oxide by 2.0 ml of *strong sodium hydroxide solution R*.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 2.000 g in *water R* and dilute to 100.0 ml with the same solvent. Transfer 25.0 ml of the solution to a separating funnel, add 10 ml of a 4 g/l solution of *sodium hydroxide R*, 10.0 ml of a freshly prepared 50 g/l solution of *potassium iodide R* and 25 ml of *methylene chloride R*. Shake vigorously, allow to separate and discard the lower layer. Shake the upper layer with three quantities, each of 10 ml, of *methylene chloride R* and discard the lower layers. To the upper layer add 40 ml of *hydrochloric acid R*, allow to cool and titrate with 0.05 M *potassium iodate* until the deep brown colour is almost discharged. Add 4 ml of *methylene chloride R* and continue the titration, shaking vigorously, until the lower layer is no longer brown. Carry out a blank titration using a mixture of 10.0 ml of a freshly prepared 50 g/l solution of *potassium iodide R*, 20 ml of *water R* and 40 ml of *hydrochloric acid R*.

1 ml of 0.05 M *potassium iodate* is equivalent to 44.81 mg of C₉H₁₁NO₂.

STORAGE

Store protected from light.

Second identification: A, C, D.

A. Melting point (2.2.14): 89 °C to 92 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *benzocaine CRS*.

C. To about 50 mg in a test-tube add 0.2 ml of a 500 g/l solution of *chromium trioxide R*. Cover the mouth of the tube with a piece of filter paper moistened with a freshly prepared mixture of equal volumes of a 50 g/l solution of *sodium nitroprusside R* and a 200 g/l solution of *piperazine hydrate R*. Boil gently for at least 30 s. A blue colour develops on the filter paper.

D. Dissolve about 50 mg in *alcohol R* and dilute to 100 ml with the same solvent. 2 ml of the solution gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in *alcohol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. Dissolve 0.5 g in 10 ml of *alcohol R* previously neutralised to 0.05 ml of *phenolphthalein solution R*. Add 10 ml of *carbon dioxide-free water R*. The solution remains colourless and not more than 0.5 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying *in vacuo*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in a mixture of 25 ml of *hydrochloric acid R* and 50 ml of *water R*. Carry out the determination of primary aromatic amino-nitrogen (2.5.8).

1 ml of 0.1 M *sodium nitrite* is equivalent to 16.52 mg of C₉H₁₁NO₂.

STORAGE

Store protected from light.

01/2005:0011

BENZOCAINE

Benzocainum

C₉H₁₁NO₂

M_r 165.2

DEFINITION

Benzocaine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of ethyl 4-aminobenzoate, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, very slightly soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: A, B.

01/2005:0066

BENZOIC ACID

Acidum benzoicum

C₇H₆O₂

M_r 122.1

DEFINITION

Benzoic acid contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of benzenecarboxylic acid.

CHARACTERS

A white, crystalline powder or colourless crystals, odourless or with a very slight characteristic odour, slightly soluble in water, soluble in boiling water, freely soluble in alcohol and in fatty oils.

IDENTIFICATION

A. Melting point (2.2.14): 121 °C to 124 °C.

B. Solution S (see Tests) gives reaction (a) of benzoates (2.3.1).

01/2005:0704

TESTS

Solution S. Dissolve 5.0 g in *alcohol R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Carbonisable substances. Dissolve 0.5 g with shaking in 5 ml of *sulphuric acid R*. After 5 min, the solution is not more intensely coloured than reference solution Y₅ (2.2.2, *Method I*).

Oxidisable substances. Dissolve 0.2 g in 10 ml of boiling *water R*. Cool, shake and filter. To the filtrate add 1 ml of *dilute sulphuric acid R* and 0.2 ml of 0.02 M *potassium permanganate*. After 5 min, the solution is still coloured pink.

Halogenated compounds and halides.

All glassware used must be chloride-free and may be prepared by soaking overnight in a 500 g/l solution of nitric acid R, rinsed with water R and stored full of water R. It is recommended that glassware be reserved for this test.

Solution (a). Dissolve 6.7 g of the substance to be examined in a mixture of 40 ml of 1 M *sodium hydroxide* and 50 ml of *alcohol R* and dilute to 100.0 ml with *water R*. To 10.0 ml of this solution add 7.5 ml of *dilute sodium hydroxide solution R* and 0.125 g of *nickel-aluminium alloy R* and heat on a water-bath for 10 min. Allow to cool to room temperature, filter into a 25 ml volumetric flask and wash with three quantities, each of 2 ml, of *alcohol R*. Dilute the filtrate and washings to 25.0 ml with *water R*. This solution is used to prepare solution A.

Solution (b). In the same manner, prepare a similar solution without the substance to be examined. This solution is used to prepare solution B.

In four 25 ml volumetric flasks, place separately 10 ml of solution (a), 10 ml of solution (b), 10 ml of *chloride standard solution (8 ppm Cl) R* (used to prepare solution C) and 10 ml of *water R*. To each flask add 5 ml of *ferric ammonium sulphate solution R5*, mix and add dropwise and with swirling 2 ml of *nitric acid R* and 5 ml of *mercuric thiocyanate solution R*. Shake. Dilute the contents of each flask to 25.0 ml with *water R* and allow the solutions to stand in a water-bath at 20 °C for 15 min. Measure at 460 nm the absorbance (2.2.25) of solution A using solution B as the compensation liquid, and the absorbance of solution C using the solution obtained with 10 ml of *water R* as the compensation liquid. The absorbance of solution A is not greater than that of solution C (300 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test B for heavy metals (10 ppm). Prepare the standard using a mixture of 5 ml of *lead standard solution (1 ppm Pb) R* and 5 ml of *alcohol R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 20 ml of *alcohol R* and titrate with 0.1 M *sodium hydroxide*, using 0.1 ml of *phenol red solution R* as indicator, until the colour changes from yellow to violet-red.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 12.21 mg of C₇H₆O₂.

BENZOYL PEROXIDE, HYDROUS

Benzoylis peroxidum cum aqua

C₁₄H₁₀O₄M_r 242.2

DEFINITION

Content:

- dibenzoyl peroxide: 70.0 per cent to 77.0 per cent,
- water: minimum 20.0 per cent.

CHARACTERS

Appearance: white, amorphous or granular powder.

Solubility: practically insoluble in water, soluble in acetone, soluble in methylene chloride with the separation of water, slightly soluble in alcohol.

It loses water rapidly on exposure to air with a risk of explosion.

Mix the entire sample thoroughly before carrying out the following tests.

IDENTIFICATION

First identification: B

Second identification: A, C, D.

- Dissolve 80.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *alcohol R* (solution A). Dilute 10.0 ml of solution A to 100.0 ml with *alcohol R* (solution B). Examined between 250 nm and 300 nm (2.2.25), solution A shows an absorption maximum at 274 nm and a shoulder at about 282 nm. Examined between 220 nm and 250 nm, solution B shows an absorption maximum at 235 nm. The ratio of the absorbance at the maximum at 235 nm (solution B) to that at the maximum at 274 nm (solution A) is 1.17 to 1.21.
- Infrared absorption spectrophotometry (2.2.24).
Comparison: Ph. Eur. reference spectrum of hydrous benzoyl peroxide.
- Dissolve about 25 mg in 2 ml of *acetone R*. Add 1 ml of a 10 g/l solution of *diethylphenylenediamine sulphate R* and mix. A red colour develops which quickly darkens and becomes dark violet within 5 min.
- To 1 g add 5 ml of *alcohol R*, 5 ml of *dilute sodium hydroxide solution R* and 10 ml of *water R*. Boil the mixture under reflux for 20 min. Cool. The solution gives reaction (c) of benzoates (2.3.1).

TESTS

Acidity. Dissolve a quantity of the substance to be examined containing the equivalent of 1.0 g of dibenzoyl peroxide in 25 ml of *acetone R*, add 75 ml of *water R* and filter. Wash the residue with two quantities, each of 10 ml, of *water R*. Combine the filtrate and the washings and add 0.25 ml of *phenolphthalein solution R1*. Not more than 1.25 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator. Carry out a blank test.

Related substances. Liquid chromatography (2.2.29).
Prepare the solutions immediately before use.

Test solution. Dissolve a quantity of the substance to be examined containing the equivalent of 0.10 g of dibenzoyl peroxide in *acetonitrile R* and dilute to 50 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*. Dilute 1.0 ml of this solution to 10.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 30.0 mg of *benzoic acid R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 50.0 mg of *ethyl benzoate R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (d). Dissolve 50.0 mg of *benzaldehyde R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (e). Dissolve 30.0 mg of *benzoic acid R* and 30.0 mg of *benzaldehyde R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (10 μ m),

Mobile phase: glacial acetic acid *R*, acetonitrile *R*, water *R* (1:500:500 V/V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 235 nm.

Injection: 20 μ l loop injector.

Run time: 2 times the retention time of dibenzoyl peroxide.

Relative retention with reference to dibenzoyl peroxide (retention time = about 28.4 min): impurity B = about 0.15; impurity A = about 0.2; impurity C = about 0.4.

System suitability: reference solution (e):

- resolution: minimum 6 between the peaks corresponding to benzoic acid and benzaldehyde.

Limits:

- impurity A: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.25 per cent),
- impurity B: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent),
- impurity C: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.25 per cent),
- any other impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- disregard limit: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Chlorides (2.4.4): maximum 0.4 per cent.

Dissolve a quantity of the substance to be examined containing the equivalent of 0.5 g of dibenzoyl peroxide in 15 ml of *acetone R*. Add, while stirring, 50 ml of 0.05 *M* nitric acid. Allow to stand for 10 min and filter. Wash the residue with 2 quantities, each of 10 ml, of 0.05 *M* nitric acid. Combine the filtrate and the washings and dilute to 100 ml with 0.05 *M* nitric acid. 2.5 ml of the solution diluted to 15.0 ml with water *R* complies with the limit test for chlorides.

ASSAY

Solution (a). Dissolve 2.500 g immediately before use in 75 ml of *dimethylformamide R* and dilute to 100.0 ml with the same solvent.

Dibenzoyl peroxide. To 5.0 ml of solution (a) add 20 ml of *acetone R* and 3 ml of a 500 g/l solution of *potassium iodide R* and mix. Allow to stand for 1 min. Titrate with 0.1 *M* sodium thiosulphate using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration.

1 ml of 0.1 *M* sodium thiosulphate is equivalent to 12.11 mg of $C_{14}H_{10}O_4$.

Water (2.5.12). Carry out the semi-micro determination of water, using 5.0 ml of solution (a). Use as the solvent a mixture of 20.0 ml of *anhydrous methanol R* and 3.0 ml of a 100 g/l solution of *potassium iodide R* in *dimethylformamide R*. After adding solution (a), stir for 5 min before starting the titration. Carry out a blank determination.

Calculate the percentage content of water using the expression:

$$\frac{(n_1 - n_2) \times w \times 2}{m} + (p \times 0.0744)$$

n_1 = number of millilitres of *iodosulphurous reagent R* used in the sample determination,

n_2 = number of millilitres of *iodosulphurous reagent R* used in the blank determination,

w = water equivalent of *iodosulphurous reagent R* in milligrams of water per millilitre of reagent,

m = mass of the substance to be examined used for the preparation of solution (a) in grams,

p = percentage content of dibenzoyl peroxide.

STORAGE

In a container that has been treated to reduce static discharge and that has a device for release of excess pressure, at a temperature of 2 °C to 8 °C, protected from light.

IMPURITIES

A. R = H: benzaldehyde,

B. R = OH: benzoic acid,

C. R = O-CH₂-CH₃: ethyl benzoate.

- *disregard limit*: 0.01 times the area of the peak due to ethylbenzene in the chromatogram obtained with reference solution (b) (0.0001 per cent).

Residue on evaporation: maximum 0.05 per cent.

After ensuring that the substance to be examined complies with the test for peroxide value, evaporate 10.0 g to dryness on a water-bath, dry at 100–105 °C for 1 h and allow to cool in a desiccator. The residue weighs a maximum of 5 mg.

ASSAY

To 0.900 g (m g) add 15.0 ml of a freshly prepared mixture of 1 volume of *acetic anhydride R* and 7 volumes of *pyridine R* and boil under a reflux condenser for 30 min. Cool and add 25 ml of *water R*. Using 0.25 ml of *phenolphthalein solution R* as indicator, titrate with 1 M *sodium hydroxide* (n_1 ml). Carry out a blank titration (n_2 ml).

Calculate the percentage content of C_7H_8O from the expression:

$$\frac{10.81 (n_2 - n_1)}{m}$$

STORAGE

In an airtight container, under nitrogen, protected from light at a temperature between 2 °C and 8 °C.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

BENZYL BENZOATE**Benzylis benzoas** $C_{14}H_{12}O_2$ M_r 212.2**DEFINITION**

Benzyl benzoate contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of phenylmethyl benzoate.

CHARACTERS

Colourless or almost colourless crystals or a colourless or almost colourless, oily liquid, practically insoluble in water, miscible with alcohol, with methylene chloride and with fatty and essential oils.

It boils at about 320 °C.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of benzyl benzoate*.
- To 2 g add 25 ml of *alcoholic potassium hydroxide solution R* and boil under a reflux condenser for 2 h. Remove the ethanol on a water-bath, add 50 ml of *water R* and distil; collect about 25 ml of distillate and use it for identification test C. Acidify the liquid remaining in the distillation flask with *dilute hydrochloric acid R*; a white precipitate is formed, which, when washed with *water R* and dried *in vacuo*, melts (2.2.14) at 121 °C to 124 °C.
- To the distillate obtained in identification test B add 2.5 g of *potassium permanganate R* and 5 ml of *dilute sodium hydroxide solution R*. Boil under a reflux condenser for 15 min, cool and filter. Acidify the filtrate with *dilute hydrochloric acid R*; a white precipitate is formed which, when washed with *water R* and dried *in vacuo*, melts (2.2.14) at 121 °C to 124 °C.

TESTS

Acidity. Dissolve 2.0 g in *alcohol R* and dilute to 10 ml with the same solvent. Titrate with 0.1 M *sodium hydroxide* using *phenolphthalein solution R* as indicator. Not more than 0.2 ml is required to change the colour of the indicator to pink.

Relative density (2.2.5): 1.118 to 1.122.

Refractive index (2.2.6): 1.568 to 1.570.

Freezing point (2.2.18). Not less than 17.0 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

To 2.000 g add 50.0 ml of 0.5 M *alcoholic potassium hydroxide* and boil gently under a reflux condenser for 1 h. Titrate the hot solution with 0.5 M *hydrochloric acid* using 1 ml of *phenolphthalein solution R* as indicator. Carry out a blank determination.

1 ml of 0.5 M alcoholic potassium hydroxide is equivalent to 106.1 mg of $C_{14}H_{12}O_2$.

STORAGE

Store in an airtight, well-filled container, protected from light.

01/2005:0373

BENZYLPENICILLIN, BENZATHINE

Benzylpenicillinum benzathinum

$C_{48}H_{56}N_6O_8S_2$

M_r 909

DEFINITION

Benzathine benzylpenicillin is *N,N'*-dibenzylethane-1,2-diamine compound (1:2) with (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid. It contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of benzathine benzylpenicillin and not less than 24.0 per cent and not more than 27.0 per cent of *N,N'*-dibenzylethylenediamine (benzathine $C_{16}H_{20}N_2$; M_r 240.3), both calculated with reference to the anhydrous substance. It contains a variable quantity of water. Dispersing or suspending agents may be added.

CHARACTERS

A white powder, very slightly soluble in water, freely soluble in dimethylformamide and in formamide, slightly soluble in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with benzathine benzylpenicillin CRS.
- B. Examine by thin-layer chromatography (2.2.27), using a TLC silanised silica gel plate R.

Test solution. Dissolve 25 mg of the substance to be examined in 5 ml of methanol R.

Reference solution. Dissolve 25 mg of benzathine benzylpenicillin CRS in 5 ml of methanol R.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of acetone R and 70 volumes of a 154 g/l solution of ammonium acetate R, the pH of which has been adjusted to 7.0 with ammonia R. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The two principal spots in the chromatogram obtained with the test solution are similar in position, colour and size to the two principal spots in the chromatogram obtained with the reference solution. The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of water R and add 2 ml of sulphuric acid-formaldehyde reagent R. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube on a water-bath for 1 min; a reddish-brown colour develops.
- D. To 0.1 g add 2 ml of 1 M sodium hydroxide and shake for 2 min. Shake the mixture with two quantities, each of 3 ml, of ether R. Evaporate the combined ether layers to dryness and dissolve the residue in 1 ml of alcohol (50 per cent V/V) R. Add 5 ml of picric acid solution R, heat at 90 °C for 5 min and allow to cool slowly. Separate the crystals and recrystallise from alcohol (25 per cent V/V) R containing 10 g/l of picric acid R. The crystals melt (2.2.14) at about 214 °C.

TESTS

Acidity or alkalinity. To 0.50 g add 100 ml of carbon dioxide-free water R and shake for 5 min. Filter through a sintered-glass filter. To 20 ml of the filtrate add 0.1 ml of bromothymol blue solution R1. The solution is green or yellow. Not more than 0.2 ml of 0.02 M sodium hydroxide is required to change the colour of the indicator to blue.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use, using sonication (for about 2 min) to dissolve the samples. Avoid any over heating during the sample preparation.

Test solution. Dissolve 70.0 mg of the substance to be examined in 25 ml of methanol R and dilute to 50.0 ml with a solution containing 6.8 g/l of potassium dihydrogen phosphate R and 1.02 g/l of disodium hydrogen phosphate R.

Reference solution (a). Dissolve 70.0 mg of benzathine benzylpenicillin CRS in 25 ml of methanol R and dilute to 50.0 ml with a solution containing 6.8 g/l of potassium dihydrogen phosphate R and 1.02 g/l of disodium hydrogen phosphate R.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.0$ mm,
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm),
- temperature: 40 °C.

Mobile phase:

- mobile phase A: mix 10 volumes of a 34 g/l solution of potassium dihydrogen phosphate R adjusted to pH 3.5 with phosphoric acid R, 30 volumes of methanol R and 60 volumes of water R,
- mobile phase B: mix 10 volumes of a 34 g/l solution of potassium dihydrogen phosphate R adjusted to pH 3.5 with phosphoric acid R, 30 volumes of water R and 60 volumes of methanol R,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	75	25
10 - 20	75 → 0	25 → 100
20 - 55	0	100
55 - 70	75	25

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl; inject the test solution and the reference solutions.

System suitability: reference solution (a)

- *relative retention* with reference to benzylpenicillin: benzathine = 0.3 to 0.4; impurity C = about 2.4. If necessary, adjust the concentration of methanol in the mobile phase.

Limits:

- *impurity C*: not more than twice the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (b) (2 per cent),
- *any other impurity*: not more than the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (b) (1 per cent),
- *disregard limit*: 0.05 times the sum of the areas of the 2 principal peaks in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.5.12): 5.0 per cent to 8.0 per cent, determined on 0.300 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14, Method E). Suspend 20 mg of the substance to be examined in 20 ml of a solution of 0.1 M sodium hydroxide diluted 1 to 100, shake thoroughly and centrifuge. The supernatant contains less than 0.13 IU/ml, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Mobile phase: phosphate buffer solution pH 3.5 R, methanol R, water R (10:35:55 V/V/V).

Injection: 20 μ l; inject the test solution and reference solution (a).

Calculate the percentage contents of benzathine and of benzathine benzylpenicillin. Calculate the latter by multiplying the percentage content of benzylpenicillin by 1.36.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- where applicable, the name and quantity of any added dispersing or suspending agent,
- where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. monobenzylethylenediamine,

B. phenylacetic acid,

C. benzylpenicilloic acids benzathide,

BENZYL PENICILLIN POTASSIUM

Benzylpenicillinum kalicum

$$\text{C}_{16}\text{H}_{17}\text{KN}_2\text{O}_4\text{S}$$
 $M_r 372.5$

DEFINITION

Benzylpenicillin potassium is potassium (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate, a substance produced by the growth of certain strains of *Penicillium notatum* or related organisms, or obtained by any other

means. It contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of benzylpenicillin potassium, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very soluble in water, practically insoluble in fatty oils and in liquid paraffin.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *benzylpenicillin potassium CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silanised silica gel plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in 5 ml of *water R*.

Reference solution (a). Dissolve 25 mg of *benzylpenicillin potassium CRS* in 5 ml of *water R*.

Reference solution (b). Dissolve 25 mg of *benzylpenicillin potassium CRS* and 25 mg of *phenoxymethylpenicillin potassium CRS* in 5 ml of *water R*.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *acetone R* and 70 volumes of a 154 g/l solution of *ammonium acetate R*, the pH of which has been adjusted to 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube on a water-bath for 1 min; a reddish-brown colour develops.
- D. It gives reaction (a) of potassium (2.3.1).

TESTS

pH (2.2.3). Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 5.5 to 7.5.

Specific optical rotation (2.2.7). Dissolve 0.500 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 270 to + 300, calculated with reference to the dried substance.

Absorbance (2.2.25). Dissolve 94.0 mg in *water R* and dilute to 50.0 ml with the same solvent. Measure the absorbance of the solution at 325 nm, 280 nm and at the maximum at 264 nm, diluting the solution, if necessary, for the measurement at 264 nm. The absorbances at 325 nm and 280 nm do not exceed 0.10 and that at the maximum at 264 nm is 0.80 to 0.88, calculated on the basis of the undiluted (1.88 g/l) solution. Verify the resolution of the apparatus (2.2.25); the ratio of the absorbances is at least 1.7.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject 20 µl of reference solution (d) and elute isocratically with the chosen mobile

phase. Inject 20 µl of test solution (b) and start the elution isocratically. Immediately after elution of the benzylpenicillin peak start the following linear gradient:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 20	70 → 0	30 → 100	linear gradient
20 - 35	0	100	isocratic
35 - 50	70	30	re-equilibration

Inject *water R* and use the same elution pattern to obtain a blank. In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (1 per cent).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Bacterial endotoxins (2.6.14, *Method E*): less than 0.16 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution (a). Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Test solution (b). Dissolve 80.0 mg of the substance to be examined in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *benzylpenicillin sodium CRS* in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *benzylpenicillin sodium CRS* and 10 mg of *phenylacetic acid CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with *water R*. Dilute 1.0 ml of the solution to 50.0 ml with *water R*.

Reference solution (d). Dilute 4.0 ml of reference solution (a) to 100.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Mix 10 volumes of a 68 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.5 with a 500 g/l solution of *dilute phosphoric acid R*, 30 volumes of *methanol R* and 60 volumes of *water R*,

Mobile phase B. Mix 10 volumes of a 68 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.5 with a 500 g/l solution of *dilute phosphoric acid R*, 40 volumes of *water R* and 50 volumes of *methanol R*,

- as detector a spectrophotometer set at 225 nm.

Equilibrate the column with a mobile phase ratio A:B of 70:30. Inject 20 µl of reference solution (b). The test is not valid unless the resolution between the 2 principal peaks is at least 6.0 (if necessary, adjust the ratio A:B of the mobile phase) and the mass distribution ratio for the second peak (benzylpenicillin) is 4.0 to 6.0. Inject 20 µl of reference solution (c). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3.

Calculate the percentage content of benzylpenicillin potassium by multiplying the percentage content of benzylpenicillin sodium by 1.045.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- B. phenylacetic acid,

- C. (2*S*,5*R*,6*R*)-6-[(4-hydroxyphenyl)acetyl]amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid,

- D. (3*S*,7*R*,7*aR*)-5-benzyl-2,2-dimethyl-2,3,7,7a-tetrahydroimidazo[5,1-*b*]thiazole-3,7-dicarboxylic acid (penillic acid of benzylpenicillin),

- E. (4*S*)-2-[carboxy[(phenylacetyl)amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of benzylpenicillin),

- F. (2*RS*,4*S*)-2-[(phenylacetyl)amino]methyl-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of benzylpenicillin).

01/2005:0115

BENZYLPENICILLIN, PROCAINE

Benzylpenicillinum procainum

$C_{29}H_{38}N_4O_6S \cdot H_2O$

M_r 588.7

DEFINITION

Procaine benzylpenicillin is the monohydrate of the (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid compound with 2-(diethylamino)ethyl 4-aminobenzoate. It contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of procaine benzylpenicillin and not less than 39.0 per cent and not more than 42.0 per cent of procaine ($C_{13}H_{20}N_2O_2$; M_r 236.3), both calculated with reference to the anhydrous substance. Dispersing or suspending agents (for example, lecithin and polysorbate 80) may be added.

CHARACTERS

A white, crystalline powder, slightly soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *procaine benzylpenicillin CRS*.
B. Examine by thin-layer chromatography (2.2.27), using a *TLC silanised silica gel plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in 5 ml of *acetone R*.

Reference solution. Dissolve 25 mg of *procaine benzylpenicillin CRS* in 5 ml of *acetone R*.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *acetone R* and 70 volumes of a 154 g/l solution of *ammonium acetate R*, the pH of which has been adjusted to 7.0 with *ammonia R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The 2 principal spots in the chromatogram obtained with the test solution are similar in position, colour and size to the 2 principal spots in the chromatogram obtained with the reference solution. The test is not valid unless the chromatogram obtained with the reference solution shows 2 clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube on a water-bath for 1 min; a reddish-brown colour develops.
- D. Dissolve 0.1 g in 2 ml of *dilute hydrochloric acid R* and use the solution which may be turbid. The solution gives the reaction of primary aromatic amines (2.3.1).

TESTS

pH (2.2.3). Dissolve 50 mg in *carbon dioxide-free water R* and dilute to 15 ml with the same solvent. Shake until dissolution is complete. The pH of the solution is 5.0 to 7.5.

Specific optical rotation (2.2.7). Dissolve 0.250 g in a mixture of 2 volumes of *water R* and 3 volumes of *acetone R* and dilute to 25.0 ml with the same mixture of solvents. The specific optical rotation is + 165 to + 180, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay. Inject 10 µl of reference solution (c). Adjust the sensitivity of the system so that the height of the peak due to benzylpenicillin is at least 50 per cent of the full scale of the recorder. Inject 10 µl of test solution (a) and continue the chromatography for 1.5 times the retention time of the benzylpenicillin peak. In the chromatogram obtained with test solution (a): the area of any peak corresponding to 4-aminobenzoic acid is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.024 per cent); the area of any peak, apart from the 2 principal peaks and any peak corresponding to 4-aminobenzoic acid, is not greater than the area of the peak corresponding to benzylpenicillin in the chromatogram obtained with reference solution (c) (1 per cent).

Water (2.5.12). 2.8 per cent to 4.2 per cent, determined on 0.500 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14, Method E): less than 0.10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution (a). Dissolve 70.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dissolve 70.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 70.0 mg of *procaine benzylpenicillin CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 4 mg of *4-aminobenzoic acid R* in reference solution (a) and dilute to 25 ml with the same solution.

Reference solution (c). Dissolve 16.8 mg of *4-aminobenzoic acid R* in *water R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *water R*. To 1.0 ml of this solution, add 1.0 ml of test solution (a) and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- as mobile phase at a flow rate of 1.75 ml/min a mixture prepared as follows: mix 250 ml of *acetonitrile R*, 250 ml of *water R* and 500 ml of a solution containing 14 g/l of *potassium dihydrogen phosphate R* and 6.5 g/l of *tetrabutylammonium hydroxide solution (400 g/l) R* adjusted to pH 7.0 with *1 M potassium hydroxide*; adjust the mixture to pH 7.2 with *dilute phosphoric acid R*, if necessary,
 - as detector a spectrophotometer set at 225 nm.
- Inject 10 µl of reference solution (b). When the chromatogram is recorded in the prescribed conditions, the substances elute in the following order: 4-aminobenzoic acid, procaine, benzylpenicillin. Adjust the sensitivity of the system so that the height of the peak corresponding to 4-aminobenzoic acid is at least 50 per cent of the full scale of the recorder. The test is not valid unless, the resolution between the first peak (4-aminobenzoic acid) and the second peak (procaine) is at least 2.0. If necessary, adjust the concentration of acetonitrile in the mobile phase. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation for the areas of the 2 peaks is at most 1.0 per cent. Inject alternately test solution (b) and reference solution (a). Calculate the percentage contents of procaine and procaine benzylpenicillin.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- where applicable, the name and quantity of any added dispersing or suspending agents,
- where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. 4-aminobenzoic acid,

B. (4*S*)-2-[[carboxy[(phenylacetyl)amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of benzylpenicillin),

C. (2*RS*,4*S*)-2-[[[(phenylacetyl)amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of benzylpenicillin),

- D. (3*S*,7*R*,7*aR*)-5-benzyl-2,2-dimethyl-2,3,7,7*a*-tetrahydroimidazo[5,1-*b*]thiazole-3,7-dicarboxylic acid (penillic acid of benzylpenicillin),

- E. phenylacetic acid.

01/2005:0114

BENZYLPENICILLIN SODIUM

Benzylpenicillinum natrium

 $C_{16}H_{17}N_2NaO_4S$ M_r 356.4

DEFINITION

Benzylpenicillin sodium is sodium (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate, a substance produced by the growth of certain strains of *Penicillium notatum* or related organisms, or obtained by any other means. It contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of benzylpenicillin sodium, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very soluble in water, practically insoluble in fatty oils and in liquid paraffin.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *benzylpenicillin sodium CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silanised silica gel plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in 5 ml of *water R*.

Reference solution (a). Dissolve 25 mg of *benzylpenicillin sodium CRS* in 5 ml of *water R*.

Reference solution (b). Dissolve 25 mg of *benzylpenicillin sodium CRS* and 25 mg of *phenoxymethylpenicillin potassium CRS* in 5 ml of *water R*.

Apply to the plate 1 μ l of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *acetone R* and 70 volumes of a 154 g/l solution of *ammonium acetate R*, the pH of which has been adjusted to 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine

in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is practically colourless. Place the test-tube on a water-bath for 1 min; a reddish-brown colour develops.

- D. It gives reaction (a) of sodium (2.3.1).

TESTS

pH (2.2.3). Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 5.5 to 7.5.

Specific optical rotation (2.2.7). Dissolve 0.500 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 285 to + 310, calculated with reference to the dried substance.

Absorbance (2.2.25). Dissolve 90.0 mg in *water R* and dilute to 50.0 ml with the same solvent. Measure the absorbance of the solution at 325 nm, at 280 nm and at the maximum at 264 nm, diluting the solution, if necessary, for the measurement at 264 nm. The absorbances at 325 nm and 280 nm are not greater than 0.10 and the absorbance at the maximum at 264 nm is 0.80 to 0.88, calculated on the basis of the undiluted (1.80 g/l) solution. Verify the resolution of the apparatus (2.2.25); the ratio of the absorbances is at least 1.7.

Related substances. Liquid chromatography (2.2.29) as described under Assay. Inject 20 μ l of reference solution (d) and elute isocratically with the chosen mobile phase. Inject 20 μ l of test solution (b) and start the elution isocratically. Immediately after elution of the benzylpenicillin peak start the following linear gradient:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 20	70 $\rightarrow$ 0	30 $\rightarrow$ 100	linear gradient
20 - 35	0	100	isocratic
35 - 50	70	30	re-equilibration

Inject *water R* and use the same elution pattern to obtain a blank. In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (1 per cent).

2-Ethylhexanoic acid (2.4.28). Not more than 0.5 per cent *m/m*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Bacterial endotoxins (2.6.14, *Method E*): less than 0.16 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution (a). Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Test solution (b). Dissolve 80.0 mg of the substance to be examined in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *benzylpenicillin sodium CRS* in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *benzylpenicillin sodium CRS* and 10 mg of *phenylacetic acid CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with *water R*. Dilute 1.0 ml of the solution to 50.0 ml with *water R*.

Reference solution (d). Dilute 4.0 ml of reference solution (a) to 100.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Mix 10 volumes of a 68 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.5 with a 500 g/l solution of *dilute phosphoric acid R*, 30 volumes of *methanol R* and 60 volumes of *water R*.

Mobile phase B. Mix 10 volumes of a 68 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.5 with a 500 g/l solution of *dilute phosphoric acid R*, 40 volumes of *water R* and 50 volumes of *methanol R*.

- as detector a spectrophotometer set at 225 nm.

Equilibrate the column with a mobile phase ratio A:B of 70:30. Inject 20 µl of reference solution (b). The test is not valid unless the resolution between the 2 principal peaks is at least 6.0 (if necessary, adjust the ratio A:B of the mobile phase) and the mass distribution ratio for the second peak (benzylpenicillin) is 4.0 to 6.0. Inject 20 µl of reference solution (c). Adjust the system to obtain a peak with a signal-to-noise ratio of at least 3.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

- B. phenylacetic acid,

- C. (2*S*,5*R*,6*R*)-6-[(4-hydroxyphenyl)acetyl]amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid,

- D. (3*S*,7*R*,7*aR*)-5-benzyl-2,2-dimethyl-2,3,7,7*a*-tetrahydroimidazo[5,1-*b*]thiazole-3,7-dicarboxylic acid (penillic acid of benzylpenicillin),

- E. (4*S*)-2-[carboxy[(phenylacetyl)amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of benzylpenicillin),

- F. (2*RS*,4*S*)-2-[(phenylacetyl)amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of benzylpenicillin).

01/2005:1069

BETACAROTENE

Betacarotenum

C₄₀H₅₆

M_r 536.9

DEFINITION

01/2005:1070

Betacarotene contains not less than 96.0 per cent and not more than the equivalent of 101.0 per cent of (all-*E*)-3,7,12,16-Tetramethyl-1,18-bis(2,6,6-trimethylcyclohex-1-enyl)octadeca-1,3,5,7,9,11,13,15,17-nonaene, calculated with reference to the dried substance.

CHARACTERS

A brown-red or brownish-red, crystalline powder, practically insoluble in water, slightly soluble in cyclohexane, practically insoluble in ethanol. It is sensitive to air, heat and light, especially in solution.

Carry out all operations as rapidly as possible avoiding exposure to actinic light; use freshly prepared solutions.

IDENTIFICATION

Dissolve 50.0 mg in 10 ml of *chloroform R* and dilute immediately to 100.0 ml with *cyclohexane R*. Dilute 5.0 ml of this solution to 100.0 ml with *cyclohexane R* (solution A; use solution A also for the test for related substances). Dilute 5.0 ml of solution A to 50.0 ml with *cyclohexane R*. (Solution B; use solution B also for the test for related substances and for the assay). Determine the absorbance (2.2.25) of solution B at 455 nm and at 483 nm using *cyclohexane R* as the compensation liquid. The ratio of the absorbance at 455 nm to that at 483 nm is between 1.14 and 1.18.

TESTS

Related substances. Determine the absorbance (2.2.25) of solution B at 455 nm and that of solution A at 340 nm, used in Identification. The ratio of the absorbance at 455 nm to that at 340 nm is not less than 1.5.

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.2 per cent, determined on 1.000 g by drying *in vacuo* over *diphosphorus pentoxide R* at 40 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g, moistened with a mixture of 2 ml of *dilute sulphuric acid R* and 5 ml of *alcohol R*.

ASSAY

Measure the absorbance (2.2.25) of solution B used in Identification at the maximum at 455 nm, using *cyclohexane R* as the compensation liquid.

Calculate the content of C₄₀H₅₆ taking the specific absorbance to be 2500.

STORAGE

Store in an airtight container, protected from light, at a temperature not exceeding 25 °C.

BETADEX

Betadexum

[C₆H₁₀O₅]₇M_r 1135

DEFINITION

Betadex (betacyclodextrin) contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of cyclo-α-(1→4)-D-heptagluco-pyranoside, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, amorphous or crystalline powder, sparingly soluble in water, freely soluble in propylene glycol, practically insoluble in ethanol and in methylene chloride.

IDENTIFICATION

- It complies with the test for specific optical rotation (see Tests).
- Examine the chromatograms obtained in the assay. The retention time and size of the principal peak in the chromatogram obtained with test solution (b) are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (c).
- Dissolve 0.2 g in 2 ml of *iodine solution R4* by warming on a water-bath, and allow to stand at room temperature. A yellowish-brown precipitate is formed.

TESTS

Solution S. Dissolve 1.000 g in *carbon dioxide-free water R* with heating, allow to cool and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1).

pH (2.2.3). To 10 ml of solution S add 0.1 ml of a saturated solution of *potassium chloride R*. The pH of the solution is 5.0 to 8.0.

Specific optical rotation (2.2.7): + 160 to + 164, determined on solution S and calculated with reference to the dried substance.

Reducing sugars

Test solution. To 1 ml of solution S add 1 ml of *cupri-tartaric solution R4*. Heat on a water-bath for 10 min, cool to room temperature. Add 10 ml of *ammonium molybdate reagent R1* and allow to stand for 15 min.

Reference solution. Prepare a reference solution at the same time and in the same manner as the test solution, using 1 ml of a 0.02 g/l solution of *glucose R*.

Measure the absorbance of the test solution and the reference solution (2.2.25) at the maximum at 740 nm using *water R* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution (0.2 per cent).

Light-absorbing impurities. Examine solution S between 230 nm and 750 nm (2.2.25). Between 230 nm and 350 nm, the absorbance is not greater than 0.10. Between 350 nm and 750 nm, the absorbance is not greater than 0.05.

Related substances. Examine by liquid chromatography (2.2.29), as described under Assay. Inject separately test solution (a) and reference solution (b). In the chromatogram obtained with test solution (a): the areas of any peaks corresponding to gammacyclodextrin and alphacyclodextrin are not greater than half of the area of the corresponding peaks in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak and any peaks corresponding to alphacyclodextrin and gammacyclodextrin, is not greater than half of the area of the peak corresponding to betadex in the chromatogram obtained with reference solution (b) (0.5 per cent).

Residual solvents. Not more than 10 ppm of trichloroethylene and not more than 10 ppm of toluene. Examine by head-space gas chromatography (2.2.28), using the standard additions method and *ethylene chloride R* as the internal standard.

Test solutions. In each of four identical 20 ml flasks, dissolve 500 mg of the substance to be examined in *water R* and add 0.10 g of *calcium chloride R* and 30 µl of *α-amylase solution R*. Add 1 ml of reference solutions (a), (b), (c) and (d), adding a different solution to each flask. Dilute to 10 ml with *water R*.

Reference solutions. Prepare reference solution (a) containing 10 µl of *ethylene chloride R* per litre. From reference solution (a), prepare reference solutions (b), (c) and (d) containing per litre: 5 µl, 10 µl and 15 µl each of *trichloroethylene R* and of *toluene R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 25 m long and 0.32 mm in internal diameter coated with a layer about 1 µm thick of *macrogol 20 000 R*,
- *helium for chromatography R* as the carrier gas,
- a flame-ionisation detector,

maintaining the temperature of the column at 50 °C, that of the injection port at 140 °C and that of the detector at 280 °C. Place the samples in a thermostated chamber at 45 °C for 2 h. Inject 200 µl of the head-space of each flask and repeat each test at least three times. The retention time of toluene is about 10 min. The test is not valid unless: the resolutions between the peaks corresponding to trichloroethylene and toluene and between the peaks corresponding to toluene and ethylene chloride are greater than 1.1 and the relative standard deviations of the ratios of the areas of the peaks corresponding to trichloroethylene and toluene to that of the peak corresponding to ethylene chloride are less than 5 per cent.

Calculate the content of trichloroethylene and of toluene taking their relative densities to be 1.46 and 0.87, respectively.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 16.0 per cent, determined on 1.000 g by drying in an oven at 120 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 0.25 g of the substance to be examined in *water R* with heating, cool and dilute to 25.0 ml with the same solvent.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with *water R*.

Reference solution (a). Dissolve 25.0 mg of *alfadex CRS*, 25.0 mg of *gammacyclodextrin CRS* and 50.0 mg of *betadex CRS* in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with *water R*.

Reference solution (c). Dissolve 25.0 mg of *betadex CRS* in *water R* and dilute to 25.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 10 volumes of *methanol R* and 90 volumes of *water R*,
- as detector a differential refractometer,
- a 50 µl loop injector.

Equilibrate the column with the mobile phase at a flow rate of 1.5 ml/min for about 3 h. Inject each solution. Record the chromatograms for 1.5 times the retention time of betadex. Adjust the sensitivity of the detector so that the height of the peak corresponding to gammacyclodextrin, in the chromatogram obtained with reference solution (a), is 55 per cent to 75 per cent of the full scale of the recorder. The retention time of betadex is about 10 min, the relative retention time of gammacyclodextrin is about 0.3 and that of alfadex is about 0.45. The test is not valid unless the resolution between the peaks corresponding to gammacyclodextrin and alfadex is not less than 1.5, and the relative standard deviation of the area of the peak corresponding to betadex is less than 2.0 per cent. If necessary, adjust the concentration of methanol in the mobile phase to achieve the required resolution. Calculate the percentage content of $[C_6H_{10}O_5]_n$ from the area of the principal peak in each of the chromatograms obtained with test solution (b) and reference solution (c) and the declared content of *betadex CRS*.

STORAGE

Store in an airtight container.

IMPURITIES

A. $n = 6$: alfadex,

B. $n = 8$: gammacyclodextrin.

01/2005:1071 TESTS

BETAHISTINE MESILATE

Betahistini mesilas

 $C_{10}H_{20}N_2O_6S_2$ M_r 328.4

DEFINITION

Betahistine mesilate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of *N*-methyl-2-(pyridin-2-yl)ethanamine bis(methanesulphonate), calculated with reference to the anhydrous, 2-propanol-free substance.

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

CHARACTERS

A white, crystalline powder, very hygroscopic, very soluble in water, freely soluble in alcohol, very slightly soluble in 2-propanol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (2.2.14): 108 °C to 112 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *betahistine mesilate* CRS. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in *alcohol* R and dilute to 2 ml with the same solvent.

Reference solution. Dissolve 10 mg of *betahistine mesilate* CRS, in *alcohol* R and dilute to 2 ml with the same solvent.

Apply to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 0.75 volumes of *concentrated ammonia* R, 15 volumes of *ethyl acetate* R and 30 volumes of *methanol* R. Dry the plate at 110 °C for 10 min and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. To 0.1 g add 5 ml of *dilute hydrochloric acid* R and shake for about 5 min. Add 1 ml of *barium chloride solution* R1. The solution remains clear. To a further 0.1 g add 0.5 g of *anhydrous sodium carbonate* R, mix and ignite until a white residue is obtained. Allow to cool and dissolve the residue in 7 ml of *water* R. The solution gives reaction (a) of sulphates (2.3.1).

Solution S. Dissolve 5.0 g in *carbon dioxide-free water* R prepared from *distilled water* R, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 2.0 to 3.0.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 10 mg of *betahistine mesilate* CRS and 10 mg of *2-vinylpyridine* R in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography* R (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: dissolve 2.0 g of *sodium dodecyl sulphate* R in a mixture of 15 volumes of a 10 per cent V/V solution of *sulphuric acid* R, 35 volumes of a 17 g/l solution of *tetrabutylammoniumhydrogen sulphate* R and 650 volumes of *water* R; adjust to pH 3.3 using *dilute sodium hydroxide solution* R and mix with 300 volumes of *acetonitrile* R,
- as detector a spectrophotometer set at 260 nm.

Inject 20 µl of reference solution (a). When using a recorder, adjust the sensitivity of the system so that the height of the first peak in the chromatogram obtained with reference solution (a) is not less than 70 per cent of the full scale of the recorder. The test is not valid unless: in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to 2-vinylpyridine and betahistine mesilate is at least 3.5.

Inject 20 µl of the test solution and of reference solutions (b) and (c). Continue the chromatography for 3 times the retention time of betahistine mesilate (which is about 8 min). In the chromatogram obtained with the test solution the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent); the sum of the areas of any peaks, apart from the principal peak, is not greater than half of the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Disregard any peak with an area less than 0.025 times that of the principal peak in the chromatogram obtained with reference solution (b).

2-Propanol. Not more than 0.5 per cent, determined by the test for residual solvents (2.4.24).

Chlorides (2.4.4). To 14 ml of solution S add 1 ml of *water* R. The solution complies with the limit test for chlorides (35 ppm).

Sulphates (2.4.13). Dilute 6 ml of solution S to 15 ml with *distilled water* R. The solution complies with the limit test for sulphates (250 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) R.

Water (2.5.12). Not more than 2.0 per cent, determined on 0.50 g by the semi-micro determination of water.

ASSAY

Dissolve 0.140 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid* R and 7 volumes of *acetic anhydride* R. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 16.42 mg of $C_{22}H_{29}FO_5$.

STORAGE

Store in an airtight container.

IMPURITIES

A. 2-ethenylpyridine.

01/2005:0312

BETAMETHASONE

Betamethasonum

$C_{22}H_{29}FO_5$

M_r 392.5

DEFINITION

Betamethasone contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in ethanol, very slightly soluble in methylene chloride.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E.

- A. Dissolve 10.0 mg in *ethanol* R and dilute to 100.0 ml with the same solvent. Place 2.0 ml of the solution in a stoppered tube, add 10.0 ml of *phenylhydrazine-sulphuric acid solution* R, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution measured at 419 nm is not greater than 0.10.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *betamethasone CRS*. If the spectra obtained in the solid state with the substance to be examined and the reference substance show differences, dissolve the substance to be

examined and the reference substance separately in the smallest necessary quantity of *methylene chloride* R and evaporate to dryness on a water-bath. Using the residues, record the spectra again.

- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol* R and 9 volumes of *methylene chloride* R and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *betamethasone CRS* in a mixture of 1 volume of *methanol* R and 9 volumes of *methylene chloride* R and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *dexamethasone CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Apply separately to the plate 5 µl of each solution.

Develop over a path of 15 cm using a mixture of 5 volumes of *butanol* R saturated with *water* R, 10 volumes of *toluene* R and 85 volumes of *ether* R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid* R. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the chromatograms in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two spots which may however not be completely separated.

- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide* R and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water* R, 0.05 ml of *phenolphthalein solution* R1 and about 1 ml of *dilute hydrochloric acid* R to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution* R and 0.1 ml of *zirconyl nitrate solution* R. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.
- E. Add about 2 mg to 2 ml of *sulphuric acid* R and shake to dissolve. Within 5 min, a deep reddish-brown colour develops. Add the solution to 10 ml of *water* R and mix. The colour is discharged and a clear solution remains.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.125 g in *methanol* R and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 118 to + 126, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile* R and *methanol* R and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *betamethasone CRS* and 2 mg of *methylprednisolone CRS* in mobile phase A and dilute to 100.0 ml with the same mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2.5 ml/min, a linear-gradient programme using the following conditions:

Mobile phase A. In a 1000 ml volumetric flask mix 250 ml of *acetonitrile R* with 700 ml of *water R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0	100	0	isocratic
15	100	0	begin linear gradient
40	0	100	end chromatogram, return to 100A
41	100	0	begin equilibration with A
46 = 0	100	0	end equilibration, begin next chromatogram

- as detector a spectrophotometer set at 254 nm, maintaining the temperature of the column at 45 °C.

Equilibrate the column with mobile phase B at a flow rate of 2.5 ml/min for at least 30 min and then with mobile phase A for 5 min. For subsequent chromatograms, use the conditions described from 40 min to 46 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is not less than 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the conditions described above, the retention times are: methylprednisolone, about 11.5 minutes and betamethasone, about 12.5 minutes. The test is not valid unless the resolution between the peaks corresponding to methylprednisolone and betamethasone is at least 1.5; if necessary, adjust the concentration of acetonitrile in mobile phase A.

Inject separately 20 µl of the mixture of equal volumes of *acetonitrile R* and *methanol R* as a blank, 20 µl of the test solution and 20 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Disregard any peak due to the blank and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 238.5 nm.

Calculate the content of C₂₂H₂₉FO₅ taking the specific absorbance to be 395.

STORAGE

Store protected from light.

IMPURITIES

A. dexamethasone,

B. 21-chloro-9-fluoro-11β,17-dihydroxy-16β-methylpregna-1,4-diene-3,20-dione,

BETAMETHASONE ACETATE

Betamethasoni acetat

$C_{24}H_{31}FO_6$

M_r 434.5

DEFINITION

Betamethasone acetate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11 β ,17-dihydroxy-16 β -methyl-3,20-dioxopregna-1,4-diene-21-yl acetate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone, soluble in alcohol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E, F.

- Dissolve 10.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Place 2.0 ml of this solution in a ground-glass-stoppered tube, add 10.0 ml of *phenylhydrazine-sulphuric acid solution R*, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution measured at 419 nm is not more than 0.10.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *betamethasone acetate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *methanol R*, evaporate to dryness on a water-bath and record new spectra using the residues.
- Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *betamethasone acetate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *prednisolone acetate CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Apply to the plate 5 μ l of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the plate in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a deep reddish-brown colour develops. Add the solution to 10 ml of *water R* and mix. The colour is discharged and a clear solution remains.
- Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture

of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

F. About 10 mg gives the reaction of acetyl (2.3.1).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 120 to + 128, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 4 ml of *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *betamethasone acetate CRS* and 2 mg of *dexamethasone acetate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 1000 ml volumetric flask mix 380 ml of *acetonitrile R* with 550 ml of *water R* and allow to equilibrate; dilute to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: betamethasone acetate about 19 min and dexamethasone acetate about 22 min. The test is not valid unless the resolution between the peaks due to betamethasone acetate and dexamethasone acetate is at least 3.3; if necessary, adjust slightly the concentration of acetonitrile in the mobile phase.

Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 2.5 times the retention time of the principal peak in the chromatogram obtained with the test solution. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.25 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Water (2.5.12). Not more than 4.0 per cent, determined on 0.100 g by the semi-micro determination of water.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 240 nm.

Calculate the content of $C_{24}H_{31}FO_6$ taking the specific absorbance to be 350.

STORAGE

Store protected from light.

IMPURITIES

- A. betamethasone,
B. dexamethasone acetate,

- C. betamethasone 11,21-diacetate,

- D. 9,11β-epoxy-17-hydroxy-16β-methyl-3,20-dioxo-9β-pregna-1,4-diene-21-yl acetate.

BETAMETHASONE DIPROPIONATE

Betamethasoni dipropionas

$C_{28}H_{37}FO_7$

M_r 504.6

DEFINITION

Betamethasone dipropionate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11β-hydroxy-16β-methyl-3,20-dioxopregna-1,4-diene-17,21-diyl dipropanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone and in methylene chloride, sparingly soluble in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, D, E, F.

- A. Dissolve 10.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Place 2.0 ml of this solution in a ground-glass-stoppered tube, add 10.0 ml of *phenylhydrazine-sulphuric acid solution R*, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution measured at 419 nm is not more than 0.10.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *betamethasone dipropionate CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *betamethasone dipropionate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *desoxycortone acetate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. Dilute 5 ml of this solution to 10 ml with reference solution (a).

Apply to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. This solution is also used to prepare test solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Test solution (b). Transfer 2 ml of the solution obtained during preparation of test solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a current of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 2 h. Allow to cool.

Reference solution (a). Dissolve 25 mg of *betamethasone dipropionate CRS* in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. This solution is also used to prepare reference solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Reference solution (b). Transfer 2 ml of the solution obtained during preparation of reference solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a current of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 2 h. Allow to cool.

Apply to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution. Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spot in each of the chromatograms obtained with test solution (b) and reference solution (b) has an R_f value distinctly lower than that of the principal spots in each of the chromatograms obtained with test solution (a) and reference solution (a).

- E. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a deep reddish-brown colour develops. Add the solution to 10 ml of *water R* and mix. The colour is discharged and a clear solution remains.
- F. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 63 to + 70, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 62.5 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.5 mg of *betamethasone dipropionate CRS* and 2.5 mg of *beclometasone dipropionate CRS* in the mobile phase and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

01/2005:0810

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: mix carefully 350 ml of *water R* with 600 ml of *acetonitrile R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm.

Adjust the sensitivity so that the height of the principal peak in the chromatogram obtained with reference solution (b) is 70 per cent to 90 per cent of the full scale of the recorder.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 45 min. Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: betamethasone dipropionate, about 9 min; beclomethasone dipropionate, about 10.7 min. The test is not valid unless the resolution between the peaks corresponding to betamethasone dipropionate and beclomethasone dipropionate is at least 2.5; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Disregard any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.500 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve 50.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 50.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 240 nm.

Calculate the content of $C_{22}H_{28}FO_7$ taking the specific absorbance to be 305.

STORAGE

Store protected from light.

BETAMETHASONE SODIUM PHOSPHATE

Betamethasoni natrii phosphas

 $C_{22}H_{28}FNa_2O_8P$
 M_r 516.4

DEFINITION

Betamethasone sodium phosphate contains not less than 96.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11β,17-dihydroxy-16β-methyl-3,20-dioxopregna-1,4-diene-21-yl disodium phosphate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, very hygroscopic, freely soluble in water, slightly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E, F.

- Dissolve 10.0 mg in 5 ml of *water R* and dilute to 100.0 ml with *ethanol R*. Place 2.0 ml of this solution in a ground-glass-stoppered tube, add 10.0 ml of *phenylhydrazine-sulphuric acid solution R*, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution measured at the maximum at 450 nm is not more than 0.10.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *betamethasone sodium phosphate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *alcohol R*, evaporate to dryness on a water-bath and record new spectra using the residues.
- Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *betamethasone sodium phosphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *prednisolone sodium phosphate CRS* in *methanol R* and dilute to 10 ml with the same solvent. Dilute 5 ml of this solution to 10 ml with reference solution (a).

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is

similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two spots which may however not be completely separated.

- D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, an intense reddish-brown colour develops. Add the solution to 10 ml of *water R* and mix. The colour is discharged and a clear solution remains.
- E. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.
- F. To about 40 mg add 2 ml of *sulphuric acid R* and heat gently until white fumes are evolved. Add *nitric acid R* dropwise, continue the heating until the solution is almost colourless and cool. Add 2 ml of *water R*, heat until white fumes are again evolved, cool, add 10 ml of *water R* and neutralise to *red litmus paper R* with *dilute ammonia R1*. The solution gives reaction (a) of sodium (2.3.1) and reaction (b) of phosphates (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, Method II).

pH (2.2.3). Dilute 1 ml of solution S to 5 ml with *carbon dioxide-free water R*. The pH of the solution is 7.5 to 9.0.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 98 to + 104, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 62.5 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of *betamethasone sodium phosphate CRS* and 25 mg of *dexamethasone sodium phosphate CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 250 ml conical flask, weigh 1.360 g of *potassium dihydrogen phosphate R* and 0.600 g of *hexylamine R*, mix and allow to stand for 10 min and then dissolve in 185 ml of *water R*; add 65 ml of *acetonitrile R*, mix and filter (0.45 µm),
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 45 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is 70 per cent to 90 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the conditions described above, the retention times are: betamethasone sodium phosphate about 14 min; dexamethasone sodium phosphate about 15.5 min. The test is not valid unless the resolution between the peaks corresponding to betamethasone sodium phosphate and dexamethasone sodium phosphate is at least 2.0; if necessary, increase the concentration of acetonitrile or increase the concentration of water in the mobile phase.

Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent). Disregard any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Inorganic phosphate. Dissolve 50 mg in *water R* and dilute to 100 ml with the same solvent. To 10 ml of this solution add 5 ml of *molybdovanadic reagent R*, mix and allow to stand for 5 min. Any yellow colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 10 ml of *phosphate standard solution (5 ppm PO₄) R* (1 per cent).

Water (2.5.12). Not more than 8.0 per cent, determined on 0.200 g by the semi-micro determination of water.

ASSAY

Dissolve 0.100 g in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 250.0 ml with *water R*. Measure the absorbance (2.2.25) at the maximum at 241 nm.

Calculate the content of C₂₂H₂₈FNa₂O₈P taking the specific absorbance to be 297.

STORAGE

Store in an airtight container, protected from light.

01/2005:0811

BETAMETHASONE VALERATE

Betamethasoni valeras

 $C_{27}H_{37}FO_6$ M_r 476.6**DEFINITION**

Betamethasone valerate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11 β ,21-dihydroxy-16 β -methyl-3,20-dioxopregna-1,4-dien-17-yl pentanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone and in methylene chloride, soluble in alcohol.

It melts at about 192 °C, with decomposition.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, E, F, G.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Dissolve 10.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Place 2.0 ml of this solution in a ground-glass-stoppered tube, add 10.0 ml of *phenylhydrazine-sulphuric acid solution R*, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution measured at 419 nm is not more than 0.10.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *betamethasone 17-valerate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *chloroform R*, evaporate to dryness on a water-bath and record new spectra using the residues.
- D. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *betamethasone 17-valerate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *betamethasone 21-valerate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. Dilute 5 ml of this solution to 10 ml with reference solution (a).

Apply to the plate 5 μ l of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- E. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. This solution is also used to prepare test solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Test solution (b). Transfer 2 ml of the solution obtained during preparation of test solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a current of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 3 h. Allow to cool.

Reference solution (a). Dissolve 25 mg of *betamethasone 17-valerate CRS* in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. This solution is also used to prepare reference solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Reference solution (b). Transfer 2 ml of the solution obtained during preparation of reference solution (a) to a 15 ml glass tube with a ground glass-stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a current of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 3 h. Allow to cool.

Apply to the plate 5 μ l of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine under ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution. Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatograms obtained with the corresponding reference solution. The principal

spot in each of the chromatograms obtained with test solution (b) and reference solution (b) has an R_f value distinctly lower than that of the principal spots in each of the chromatograms obtained with test solution (a) and reference solution (a).

- F. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a deep reddish-brown colour develops. Add the solution to 10 ml of *water R* and mix. The colour is discharged and a clear solution remains.
- G. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 75 to + 82, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Solution A. To 1000 ml of the mobile phase add 1 ml of *glacial acetic acid R* and mix carefully.

Test solution. Dissolve 62.5 mg of the substance to be examined in solution A and dilute to 25.0 ml with solution A.

Reference solution (a). Dissolve 2 mg of *betamethasone 17-valerate CRS* and 2 mg of *betamethasone 21-valerate CRS* in solution A and dilute to 50.0 ml with solution A.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with solution A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: mix 350 ml of *water R* with 600 ml of *acetonitrile R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase for about 45 min.

Adjust the sensitivity so that the height of the principal peak in the chromatogram obtained with reference solution (b) is 70 per cent to 90 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: betamethasone 17-valerate, about 7 min; betamethasone 21-valerate, about 9 min. The test is not valid unless the resolution between the peaks corresponding to betamethasone 17-valerate and betamethasone 21-valerate is at least 5.0; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent) and not more than

one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Disregard any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve 50.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 50.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 240 nm.

Calculate the content of $C_{27}H_{37}FO_6$ taking the specific absorbance to be 325.

STORAGE

Store protected from light.

01/2005:1072

BETAXOLOL HYDROCHLORIDE

Betaxololi hydrochloridum

$C_{18}H_{30}ClNO_3$

M_r 343.9

DEFINITION

Betaxolol hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of (2*RS*)-1-[4-[2-(cyclopropylmethoxy)ethyl]phenoxy]-3-[(1-methylethyl)amino]propan-2-ol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very soluble in water, freely soluble in alcohol, soluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (2.2.14): 113 °C to 117 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *betaxolol hydrochloride CRS*.

C. Examine by thin-layer chromatography (2.2.27), using as the coating substance *octadecylsilyl silica gel for chromatography R* with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in 1 ml of *methanol R*.

Reference solution (a). Dissolve 20 mg of *betaxolol hydrochloride CRS* in 2 ml of *methanol R*.

Reference solution (b). Dissolve 10 mg of *oxprenolol hydrochloride CRS* in 1 ml of reference solution (a).

Apply separately to the plate 2 µl of each solution. Develop over a path of 10 cm using a mixture of 0.5 volumes of *perchloric acid R*, 50 volumes of *methanol R* and 50 volumes of *water R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with a 50 g/l solution of *vanillin R* in a mixture of 5 volumes of *sulphuric acid R*, 10 volumes of *glacial acetic acid R* and 85 volumes of *methanol R*. Heat the plate at 100 °C to 105 °C until the colour of the spots reaches maximum intensity (10 min to 15 min). Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.5 g in *water R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. Add 0.2 ml of *methyl red solution R* and 0.2 ml of 0.01 M *hydrochloric acid*. The solution is red. Add 0.4 ml of 0.01 M *sodium hydroxide*. The solution is yellow.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (a). Dissolve 8 mg of the substance to be examined and 4 mg of *betaxolol impurity A CRS* in 20.0 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as the mobile phase at a flow rate of 1.5 ml/min a mixture prepared as follows: mix 175 ml of *acetonitrile R* with 175 ml of *methanol R* and dilute the mixture to 1 litre with a 3.4 g/l solution of *potassium dihydrogen phosphate R*, previously adjusted to pH 3.0 with *phosphoric acid R*,
- as the detector a spectrophotometer set at 273 nm,
- a loop injector.

Inject 20 µl of each solution. Continue the chromatography for at least four times the retention time of the principal peak in the chromatogram obtained with the test solution. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than 0.3 times the area of the peak in the chromatogram obtained with reference solution (b) (0.3 per cent) and the sum of the areas of such peaks is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (1 per cent). The test is not valid unless the resolution between the peaks due to *betaxolol impurity A* and *betaxolol* in the chromatogram obtained with reference solution (a) is at least 2.0. Disregard any peak with an area less than 0.025 times that of the peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). Dissolve 2.0 g in 20 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using 10 ml of *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 10.0 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 34.39 mg of C₁₈H₃₀ClNO₃.

STORAGE

Store protected from light.

IMPURITIES

A. R = H: (2RS)-1-[4-(2-ethoxyethyl)phenoxy]-3-[(1-methylethyl)amino]propan-2-ol,

B. R = OH: (2RS)-1-[4-(2-hydroxyethyl)phenoxy]-3-[(1-methylethyl)amino]propan-2-ol,

E. R = O-CH₂-CH₂-CH₂-CH₃: (2RS)-1-[4-(2-butoxyethyl)phenoxy]-3-[(1-methylethyl)amino]propan-2-ol,

C. 2-[4-[2-(cyclopropylmethoxy)ethyl]phenoxy]methyl]oxirane,

D. 4-[2-(cyclopropylmethoxy)ethyl]phenol.

01/2005:1394

BEZAFIBRATE

Bezafibratum

M_r 361.8

DEFINITION

Bezafibrate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 2-[4-[2-[(4-chlorobenzoyl)amino]ethyl]phenoxy]-2-methylpropanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white crystalline powder, practically insoluble in water, freely soluble in dimethylformamide, sparingly soluble in acetone and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

It shows polymorphism.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Melting point (2.2.14): 181 °C to 185 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bezafibrate* CRS. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methanol R* and evaporate to dryness. Dry the residues *in vacuo* at 80 °C for 1 h and record new spectra using the residues.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 10 mg of *bezafibrate* CRS in *methanol R* and dilute to 5 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 2.7 volumes of *glacial acetic acid R*, 30 volumes of *methyl ethyl ketone R* and 60 volumes of *xylene R*. Dry the plate at 120 °C for at least 15 min and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Solution S. Dissolve 1.0 g in *dimethylformamide R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 10.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Reference solution (c). To 1 ml of the test solution, add 1 ml of 0.1 M *hydrochloric acid* and evaporate to dryness on a hot plate. Dissolve the residue in 20 ml of the mobile phase. The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 1 ml/min a mixture of 40 volumes of a 2.72 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 2.3 with *phosphoric acid R* and 60 volumes of *methanol R*,
- as detector a spectrophotometer set at 228 nm.

Inject separately 20 µl of the test solution and 20 µl of reference solutions (a), (b) and (c). When the chromatogram is recorded in the prescribed conditions, the retention times are: impurity A about 3 min, impurity B about 3.5 min, bezafibrate about 6.0 min, impurity C about 9 min, impurity D about 14 min and impurity E about 37 min. Continue the chromatography for the time necessary to detect the ester, which, depending on the route of synthesis, may be impurity C, D or E. The test is not valid unless: in the chromatogram obtained with reference solution (c) the resolution between the two principal peaks is at least 5.0 and the principal peak in the chromatogram obtained with reference solution (b) has a signal-to-noise ratio of at least 5. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Chlorides (2.4.4). Dilute 10 ml of solution S to 50 ml with *water R*. Filter the resultant suspension through a wet filter previously washed with *water R* until free from chlorides. 15 ml of the filtrate complies with the limit test for chlorides (300 ppm). Prepare the standard using 9 ml of *chloride standard solution (5 ppm Cl) R* and 6 ml of *water R*.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 25 volumes of *water R* and 75 volumes of *alcohol R*. Using 0.1 ml of *phenolphthalein solution R* as indicator, titrate with 0.1 M *sodium hydroxide* until a pink colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 36.18 mg of C₁₉H₂₀ClNO₄.

IMPURITIES

A. 4-chloro-*N*-[2-(4-hydroxyphenyl)ethyl]benzamide (chlorobenzoyltyramine),

B. 4-chlorobenzoic acid,

- C. R = CH₃: methyl 2-[4-[2-[(4-chlorobenzoyl)amino]ethyl]phenoxy]-2-methylpropanoate,
- D. R = CH₂-CH₃: ethyl 2-[4-[2-[(4-chlorobenzoyl)amino]ethyl]phenoxy]-2-methylpropanoate,
- E. R = CH₂-CH₂-CH₂-CH₃: butyl 2-[4-[2-[(4-chlorobenzoyl)amino]ethyl]phenoxy]-2-methylpropanoate.

01/2005:1395

BIFONAZOLE

Bifonazolum

C₂₂H₁₈N₂M_r 310.4**DEFINITION**

Bifonazole contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of 1-[(*RS*)-(biphenyl-4-yl)phenylmethyl]-1*H*-imidazole, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in ethanol.

It shows polymorphism.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bifonazole CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of 2-propanol *R*, evaporate to dryness and record new spectra using the residues.

TESTS

Optical rotation (2.2.7). Dissolve 0.20 g in 20.0 ml of *methanol R*. The angle of optical rotation is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Buffer solution pH 3.2. Mix 2.0 ml of *phosphoric acid R* with *water R* and dilute to 1000.0 ml with the same solvent. Adjust to pH 3.2 (2.2.3) with *triethylamine R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in 25 ml of *acetonitrile R* and dilute to 50.0 ml with buffer solution pH 3.2.

Reference solution (a). Dilute 0.25 ml of the test solution to 50.0 ml with buffer solution pH 3.2.

Reference solution (b). Dissolve 25.0 mg of *imidazole R* (impurity C) in *acetonitrile R* and dilute to 25.0 ml with the same solvent. Dilute 0.25 ml of the solution to 100.0 ml with buffer solution pH 3.2.

Reference solution (c). Dissolve 34.2 mg of 4-[(*RS*)-(biphenyl-4-yl)phenylmethyl]-1*H*-imidazole trifluoroacetate *CRS* (corresponding to 25.0 mg of impurity B base) in *acetonitrile R* and dilute to 25.0 ml with the same solvent.

Reference solution (d). Dilute 0.25 ml of reference solution (c) to 50.0 ml with buffer solution pH 3.2.

Reference solution (e). Mix 0.25 ml of the test solution and 0.25 ml of reference solution (c) and dilute to 50.0 ml with buffer solution pH 3.2.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a gradient programme using the following conditions:

Mobile phase A. A mixture of 20 volumes of *acetonitrile R* and 80 volumes of buffer solution pH 3.2,

Mobile phase B. A mixture of 20 volumes of buffer solution pH 3.2 and 80 volumes of *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 8	60	40	isocratic elution
8 - 12	60 → 10	40 → 90	linear gradient
12 - 30	10	90	isocratic elution
30 - 32	10 → 60	90 → 40	switch to initial eluent composition
32 - 40	60	40	equilibration
40 = 0	60	40	restart isocratic elution

- as detector a spectrophotometer set at 210 nm, maintaining the column temperature at 40 °C.

Adjust the sensitivity of the system so that the height of the bifonazole peak in the chromatogram obtained with 50 µl of reference solution (e) is at least 50 per cent of the full scale of the recorder.

Inject 50 µl of reference solution (e). When the chromatogram is recorded in the prescribed conditions the retention times are: impurity B about 4 min and bifonazole about 4.5 min. The test is not valid unless the resolution between the peaks corresponding to impurity B and bifonazole is at least 2.5.

Inject 50 µl of the test solution and 50 µl each of reference solutions (a), (b) and (d). In the chromatogram obtained with the test solution: the area of any peak corresponding to impurity C is not greater than the corresponding peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the area of any peak corresponding to impurity B is not greater than 3 times the area of the corresponding peak in the chromatogram obtained with reference solution (d) (1.5 per cent); none of the peaks, apart from the principal peak and the peaks corresponding to impurities B and C, has an area greater than the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent). Disregard any peak whose area is less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 80 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 31.04 mg of $C_{22}H_{18}N_2$.

IMPURITIES

A. R-OH: (RS)-(biphenyl-4-yl)phenylmethanol,

B. 4-[(RS)-(biphenyl-4-yl)phenylmethyl]-1H-imidazole,

C. 1H-imidazole,

D. 1,3-bis[(biphenyl-4-yl)phenylmethyl]-1H-imidazolium ion.

01/2005:1588

BILBERRY FRUIT, DRIED

Myrtilli fructus siccus

DEFINITION

Dried ripe fruit of *Vaccinium myrtillus* L.

Content: minimum 1.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

CHARACTERS

Dried bilberry has a sweet and slightly astringent taste. Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- Dried bilberry is a dark blue, subglobular, shrunken berry about 5 mm in diameter, with a scar at the lower end and surmounted by the persistent calyx, which appears as a circular fold and the remains of the style. The deep violet, fleshy mesocarp contains numerous small, brown, ovoid seeds.
- Reduce to a powder (355). The powder is violet-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows: violet-pink sclereids from the endocarp and the mesocarp, usually aggregated, with thick, channelled walls; reddish-brown fragments of the

epicarp consisting of polygonal cells with moderately thickened walls; brownish-yellow fragments of the outer seed testa made up of elongated cells with U-shaped thickened walls; clusters and prisms crystals of various size of calcium oxalate.

C. Thin-layer chromatography (2.2.27)

Test solution. To 2 g of the powdered drug (355) add 20 ml of *methanol R*. Shake for 15 min and filter.

Reference solution. Dissolve 5 mg of *chrysanthemin R* in 10 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *anhydrous formic acid R*, *water R*, *butanol R* (16:19:65 V/V/V).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.

Top of the plate	
Chrysanthemin: a violet-red zone	A violet-red zone of low intensity
	A principal violet-red zone
	A compact set of other principal zones:
	– a violet-red zone
	– several violet-blue zones
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): it complies with the test for foreign matter.

Loss on drying (2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 5.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (2.8.14). Use 1.500 g of the powdered drug (355).

01/2005:1602

BILBERRY FRUIT, FRESH

Myrtilli fructus recens

DEFINITION

Fresh or frozen ripe fruit of *Vaccinium myrtillus* L.

Content: minimum 0.30 per cent of anthocyanins, expressed as cyanidin-3-glucoside chloride (chrysanthemin, $C_{21}H_{21}ClO_{11}$; M_r 485.5) (dried drug).

CHARACTERS

Sweet and slightly astringent taste.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- The fresh fruit is a blackish-blue globular berry about 5 mm in diameter. Its lower end shows a scar or, rarely, a fragment of the pedicel. The upper end is flattened and surmounted by the remains of the persistent style

and of the calyx, which appears as a circular fold. The violet, fleshy mesocarp includes 4 to 5 locules containing numerous small, brown, ovoid seeds.

- B. The crushed fresh fruit is violet-red. Examine under a microscope using *chloral hydrate solution R*. It shows violet-pink sclereids from the endocarp and the mesocarp, usually aggregated, with thick, channelled walls; reddish-brown fragments of the epicarp consisting of polygonal cells with moderately thickened walls; brownish-yellow fragments of the outer layer of the testa composed of elongated cells with U-shaped thickened walls; cluster crystals of calcium oxalate.

- C. Thin-layer chromatography (2.2.27).

Test solution. To 5 g of the freshly crushed drug, add 20 ml of *methanol R*. Stir for 15 min and filter.

Reference solution. Dissolve 5 mg of *chrysanthemin R* in 10 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *anhydrous formic acid R*, *water R*, *butanol R* (16:19:65 V/V/V).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Chrysanthemin: a violet-red zone	A violet-red zone
	A principal violet-red zone
	A compact set of other principal zones:
	– a violet-red zone
	– several violet-blue zones
Reference solution	Test solution

TESTS

Total ash (2.4.16): maximum 0.6 per cent.

Foreign matter (2.8.2): it complies with the test for foreign matter.

Loss on drying (2.2.32): 80.0 per cent to 90.0 per cent, determined on 5.000 g of the freshly crushed drug by drying in an oven at 100-105 °C.

ASSAY

Crush 50 g extemporaneously. To about 5.00 g of the crushed, accurately weighed drug, add 95 ml of *methanol R*. Stir mechanically for 30 min. Filter into a 100.0 ml volumetric flask. Rinse the filter and dilute to 100.0 ml with *methanol R*. Prepare a 50-fold dilution of this solution in a 0.1 per cent V/V solution of *hydrochloric acid R* in *methanol R*.

Measure the absorbance (2.2.25) of the solution at 528 nm, using a 0.1 per cent V/V solution of *hydrochloric acid R* in *methanol R* as the compensation liquid.

Calculate the percentage content of anthocyanins, expressed as cyanidin-3-glucoside chloride, from the expression:

$$\frac{A \times 5000}{718 \times m}$$

718 = specific absorbance of cyanidin-3-glucoside chloride at 528 nm,

A = absorbance at 528 nm,

m = mass of the substance to be examined in grams.

STORAGE

When frozen, store at or below –18 °C.

01/2005:1073

BIOTIN

Biotinum

C₁₀H₁₆N₂O₃S

M_r 244.3

DEFINITION

Biotin contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 5-[(3a*S*,4*S*,6a*R*)-2-oxohexahydrothieno[3,4-*d*]imidazol-4-yl]pentanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, very slightly soluble in water and in alcohol, practically insoluble in acetone. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *biotin CRS*.
- B. Examine the chromatograms obtained in the test for related substances (see Tests). The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. Dissolve about 10 mg in 20 ml of *water R* with heating. Allow to cool. Add 0.1 ml of *bromine water R*. The bromine water is decolourised.

TESTS

Solution S. Dissolve 0.250 g in a 4 g/l solution of *sodium hydroxide R* and dilute to 25.0 ml with the same alkaline solution.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7). The specific optical rotation is + 89 to + 93, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel (5 µm). Prepare the solutions immediately before use and keep protected from bright light.

Test solution (a). Dissolve 50 mg of the substance to be examined in *glacial acetic acid R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *glacial acetic acid R*.

Reference solution (a). Dissolve 5 mg of *biotin CRS* in *glacial acetic acid R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 20 ml with *glacial acetic acid R*.

Reference solution (c). Dilute 1 ml of test solution (b) to 40 ml with *glacial acetic acid R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *methanol R*, 25 volumes of *glacial acetic acid R* and 75 volumes of *toluene R*. Dry the plate in a current of warm air. Allow to cool and spray with *4-dimethylaminocinnamaldehyde solution R*. Examine immediately in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Suspend 0.200 g in 5 ml of *dimethylformamide R*. Heat until the substance has dissolved completely. Add 50 ml of *ethanol R* and titrate with 0.1 M *tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 24.43 mg of C₁₀H₁₆N₂O₃S.

STORAGE

Store protected from light.

IMPURITIES

A. di[3-[(3aS,4S,6aR)-2-oxohexahydrothieno[3,4-d]imidazol-4-yl]propyl]acetic acid,

B. 4-[(3aS,4S,6aR)-2-oxohexahydrothieno[3,4-d]imidazol-4-yl]butane-1,1-dicarboxylic acid,

C. 5-(3,4-diamino-2-thienyl)pentanoic acid,

D. 2-methyl-5-[(3aS,4S,6aR)-2-oxohexahydrothieno[3,4-d]imidazol-4-yl]pentanoic acid,

E. 5-[(3aS,4S,6aR)-3-benzyl-2-oxohexahydrothieno[3,4-d]imidazol-4-yl]pentanoic acid and 5-[(3aS,4S,6aR)-1-benzyl-2-oxohexahydrothieno[3,4-d]imidazol-4-yl]pentanoic acid.

01/2005:1074

BIPERIDEN HYDROCHLORIDE

Biperideni hydrochloridum

C₂₁H₃₀ClNO

M_r 347.9

DEFINITION

(1*RS*)-1-[(1*RS*,2*SR*,4*RS*)-Bicyclo[2.2.1]hept-5-en-2-yl]-1-phenyl-3-(piperidin-1-yl)propan-1-ol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: slightly soluble in water and in alcohol, very slightly soluble in methylene chloride.

mp: about 280 °C, with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *biperiden hydrochloride CRS*.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *biperiden hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *biperiden impurity A CRS* in reference solution (a) and dilute to 2 ml with the same solution.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *diethylamine R*, *methanol R*, *toluene R* (1:1:20 *V/V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

Detection B: spray with *dilute potassium iodobismuthate solution R* and then with *sodium nitrite solution R* and examine in daylight.

Results B: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

System suitability: reference solution (b):

- the chromatogram shows 2 clearly separated spots.

C. To about 20 mg add 5 ml of *phosphoric acid R*. A green colour develops.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.10 g in *carbon dioxide-free water R*, heating gently if necessary, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, *Method II*).

pH (2.2.3): 5.0 to 6.5 for solution S.

Related substances. Gas chromatography (2.2.28).

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 0.5 ml of the test solution to 100 ml with *methanol R*. Dilute 10 ml of this solution to 50 ml with *methanol R*.

Reference solution (b). Dissolve 5 mg of the substance to be examined and 5 mg of *biperiden impurity A CRS* in *methanol R* and dilute to 5 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *methanol R*.

Column:

- **material:** fused silica,
- **size:** $l = 50$ m, $\varnothing = 0.25$ mm,
- **stationary phase:** *poly(dimethyl)(diphenyl)(divinyl)siloxane R* (film thickness 0.25 µm).

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 0.4 ml/min.

Split ratio: 1:250.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	200
	5 - 40	200 → 270
Injection port		250
Detector		300

Detection: flame ionisation.

Injection: 2 µl.

Run time: twice the retention time of biperiden.

Relative retention with reference to biperiden: impurities A, B and C = between 0.95 and 1.05.

System suitability:

- **resolution:** minimum 2.5 between the peak due to biperiden (1st peak) and the peak due to impurity A (2nd peak) in the chromatogram obtained with reference solution (b),
- **signal-to-noise ratio:** minimum 6 for the principal peak in the chromatogram obtained with reference solution (a).

Limits:

- **impurities A, B, C:** for each impurity, maximum 0.50 per cent of the area of the principal peak,
- **any other impurity:** for each impurity, maximum 0.10 per cent of the area of the principal peak,
- **total of impurities A, B and C:** maximum 1.0 per cent of the area of the principal peak,
- **total of impurities other than A, B and C:** maximum 0.50 per cent of the area of the principal peak,
- **disregard limit:** 0.05 per cent of the area of the principal peak.

Impurity F (2.4.24): maximum 2 ppm.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 60 ml of *alcohol R*. In a closed vessel, titrate with 0.1 M *alcoholic potassium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *alcoholic potassium hydroxide* is equivalent to 34.79 mg of $C_{21}H_{30}ClNO$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, F.

Other detectable impurities: D, E.

- A. (1*RS*)-1-[(1*SR*,2*SR*,4*SR*)-bicyclo[2.2.1]hept-5-en-2-yl]-1-phenyl-3-(piperidin-1-yl)propan-1-ol (*endo* form),

- B. (1*RS*)-1-[(1*SR*,2*RS*,4*SR*)-bicyclo[2.2.1]hept-5-en-2-yl]-1-phenyl-3-(piperidin-1-yl)propan-1-ol,

- C. (1*RS*)-1-[(1*RS*,2*RS*,4*RS*)-bicyclo[2.2.1]hept-5-en-2-yl]-1-phenyl-3-(piperidin-1-yl)propan-1-ol,

- D. 1-[(1*RS*,2*SR*,4*RS*)-bicyclo[2.2.1]hept-5-en-2-yl]-3-(piperidin-1-yl)propan-1-one,

- E. 1-[(1*RS*,2*RS*,4*RS*)-bicyclo[2.2.1]hept-5-en-2-yl]-3-(piperidin-1-yl)propan-1-one,

- F. benzene.

01/2005:1174

BIRCH LEAF

Betulae folium

DEFINITION

Birch leaf consists of the whole or fragmented dried leaves of *Betula pendula* Roth and/or *Betula pubescens* Ehrh. as well as hybrids of both species. It contains not less than 1.5 per cent of flavonoids, calculated as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaves of both species are dark green on the adaxial surface and a lighter greenish-grey colour on the abaxial surface; they show a characteristic dense reticulate venation. The veins are light brown to almost white.

The leaves of *Betula pendula* are glabrous and show closely spaced glandular pits on both surfaces. The leaves of *Betula pendula* are 3 cm to 7 cm long and 2 cm to 5 cm wide; the petiole is long and the doubly dentate lamina is triangular to rhomboid and broadly cuneate or truncate at the base. The angle on each side is unrounded or slightly rounded, and the apex is long and acuminate.

The leaves of *Betula pubescens* show few glandular trichomes and are slightly pubescent on both surfaces. The abaxial surface shows small bundles of yellowish-grey trichomes at the branch points of the veins. The leaves of *Betula pubescens* are slightly smaller, oval to rhomboid and more rounded. They are more roughly and more regularly dentate. The apex is neither long nor acuminate.

- B. Reduce to a powder (355). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous fragments of lamina with straight-walled epidermal cells and cells of the lower epidermis surrounding anomocytic stomata (2.8.3). Peltate large glands usually measuring 100 µm to 120 µm are found on the upper and lower epidermises. The mesophyll fragments contain calcium oxalate crystals. Fragments of radial vascular bundles and sclerenchyma fibres are accompanied by crystal sheaths. If *Betula pubescens* is present, the powder also contains unicellular covering trichomes with very thick walls, about 80 µm to 600 µm long, usually between 100 µm and 200 µm.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel.

Test solution. To 1 g of the powdered drug (355) add 10 ml of *methanol R*. Heat in a water-bath at 60 °C for 5 min. Cool and filter the solution.

Reference solution. Dissolve 1 mg of *caffeic acid R* and 1 mg of *chlorogenic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Apply separately to the plates as bands, 10 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 10 volumes of *water R*, 30 volumes of *methyl ethyl ketone R* and 50 volumes of *ethyl acetate R*. Dry the plate in a current of warm air. Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray the plate with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows three zones in its lower half: in increasing order of R_f a yellowish-brown fluorescent zone (rutin), a light blue fluorescent zone (chlorogenic acid) and a yellowish-brown fluorescent zone (hyperoside), and in its upper third, a light blue fluorescent zone (caffeic acid).

The chromatogram obtained with the test solution shows three zones similar in position and fluorescence to the zones due to rutin, chlorogenic acid and hyperoside in the chromatogram obtained with the reference solution. The zone corresponding to rutin is very faint and the zone corresponding to hyperoside is intense. It also shows other yellowish-brown faint fluorescence zones

01/2005:0595

between the zones corresponding to caffeic acid and chlorogenic acid in the chromatogram obtained with the reference solution. Near the solvent front, the red fluorescent zone due to chlorophylls is visible. In the chromatogram obtained with the test solution, between this zone and the zone corresponding to caffeic acid in the chromatogram obtained with the reference solution, there is a brownish-yellow zone corresponding to quercetin.

TESTS

Foreign matter (2.8.2). Not more than 3 per cent of fragments of female catkins and not more than 3 per cent of other foreign matter.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 5.0 per cent.

ASSAY

Stock solution. In a 100 ml round-bottomed flask introduce 0.200 g of the powdered drug (355), 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton in a 100 ml flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with two quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool to room temperature, filter the liquid through a plug of absorbent cotton then filter the solution through a filter-paper in the volumetric flask, and dilute to 100.0 ml with *acetone R* by rinsing of the flask and filter. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and extract the mixture with one quantity of 15 ml and then three quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, rinse with two quantities, each of 50 ml, of *water R*, and filter the extract over 10 g of *anhydrous sodium sulphate R* into a 50 ml volumetric flask and dilute to 50.0 ml with *ethyl acetate R*.

Test solution. To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Compensation solution. Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (2.2.25) of the test solution after 30 min, by comparison with the compensation solution at 425 nm.

Calculate the percentage content of flavonoids, calculated as hyperoside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = absorbance at 425 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Store protected from light.

BISACODYL

Bisacodylum

 $C_{22}H_{19}NO_4$
 M_r 361.4

DEFINITION

Bisacodyl contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 4,4'-(pyridin-2-ylmethylenediphenyl diacetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, soluble in acetone, sparingly soluble in alcohol. It dissolves in dilute mineral acids.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

- Melting point (2.2.14): 131 °C to 135 °C.
- Dissolve 10.0 mg in a 6 g/l solution of *potassium hydroxide R* in *methanol R* and dilute to 100.0 ml with the same alkaline solvent. Dilute 10.0 ml of this solution to 100.0 ml with a 6 g/l solution of *potassium hydroxide R* in *methanol R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 248 nm and a shoulder at about 290 nm. The specific absorbance at the maximum is 632 to 672.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bisacodyl CRS*. If the spectra obtained with the substance to be examined and the reference substance show differences, dissolve separately the substance to be examined and the reference substance in *chloroform R*, evaporate to dryness and record the spectra again.
- Spray the chromatograms obtained in the test for related substances with a mixture of equal volumes of 0.05 M *iodine* and *dilute sulphuric acid R*. Examine in daylight. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Acidity or alkalinity. To 1.0 g add 20 ml of *carbon dioxide-free water R*, shake, heat to boiling, cool and filter. Add 0.2 ml of 0.01 M *sodium hydroxide* and 0.1 ml of *methyl red solution R*. The solution is yellow. Not more than 0.4 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to red.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 20 mg of *bisacodyl CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *acetone R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 10 cm using a mixture of 50 volumes of *xylene R* and 50 volumes of *methyl ethyl ketone R*. Allow the plate to dry in air, if necessary heating at 100 °C to 105 °C, and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 60 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 36.14 mg of $C_{22}H_{19}NO_4$.

STORAGE

Store protected from light.

01/2005:0012

BISMUTH SUBCARBONATE

Bismuthi subcarbonas

DEFINITION

Bismuth subcarbonate contains not less than 80.0 per cent and not more than 82.5 per cent of Bi (A, 209.0), calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water and in alcohol. It dissolves with effervescence in mineral acids.

IDENTIFICATION

- It gives the reaction of carbonates (2.3.1).
- It gives the reactions of bismuth (2.3.1).

TESTS

Solution S. Shake 5.0 g with 10 ml of *water R* and add 20 ml of *nitric acid R*. Heat to dissolve, cool and dilute to 100 ml with *water R*.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, *Method II*).

Chlorides (2.4.4). To 6.6 ml of solution S add 4 ml of *nitric acid R* and dilute to 50 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides (500 ppm).

Nitrates. To 0.25 g in a 125 ml conical flask, add 20 ml of *water R*, 0.05 ml of *indigo carmine solution R1* and then, as a single addition but with caution, 30 ml of *sulphuric acid R*. Titrate immediately with *indigo carmine solution R1* until a stable blue colour is obtained. Not more than *n* ml of the titrant is required, *n* ml being the volume corresponding to 1 mg of NO_3 (0.4 per cent).

Alkali and alkaline-earth metals. To 1.0 g add 10 ml of *water R* and 10 ml of *acetic acid R*. Boil for 2 min, cool and filter. Wash the residue with 20 ml of *water R*. To the combined filtrate and washings add 2 ml of *dilute hydrochloric acid R* and 20 ml of *water R*. Boil and pass *hydrogen sulphide R* through the boiling solution until no further precipitate is formed. Filter, wash the residue with *water R*, evaporate the combined filtrate and washings to dryness on a water-bath and add 0.5 ml of *sulphuric acid R*. Ignite gently and allow to cool. The residue weighs not more than 10 mg (1.0 per cent).

Arsenic (2.4.2). To 0.5 g in a distillation flask add 5 ml of *water R* and 7 ml of *sulphuric acid R*, allow to cool and add 5 g of *reducing mixture R* and 10 ml of *hydrochloric acid R*. Heat the contents of the flask to boiling gradually over 15 min to 30 min and continue heating at such a rate that the distillation proceeds steadily until the volume in the flask is reduced by half or until 5 min after the air-condenser has become full of steam. It is important that distillation be discontinued before fumes of sulphur trioxide appear. Collect the distillate in a tube containing 15 ml of *water R* cooled in ice-water. Wash down the condenser with *water R* and dilute the distillate to 25 ml with the same solvent. The solution complies with limit test A for arsenic (5 ppm). Prepare the standard using a mixture of 2.5 ml of *arsenic standard solution (1 ppm As) R* and 22.5 ml of *water R*.

Copper. To 5 ml of solution S, add 2 ml of *ammonia R* and dilute to 50 ml with *water R*. Filter. To 10 ml of the filtrate add 1 ml of a 1 g/l solution of *sodium diethyldithiocarbamate R*. The solution is not more intensely coloured than a standard prepared at the same time in the same manner using a mixture of 0.25 ml of *copper standard solution (10 ppm Cu) R* and 9.75 ml of *water R* instead of 10 ml of the filtrate (50 ppm).

Lead. Not more than 20 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 12.5 g of the substance to be examined in 75 ml of a mixture of equal volumes of *lead-free nitric acid R* and *water R*. Boil for 1 min, cool and dilute to 100.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using appropriate quantities of lead standard solution and a 37 per cent V/V solution of *lead-free nitric acid R*.

Measure the absorbance at 283.3 nm, using a hollow-cathode lamp as source of radiation and an air-acetylene flame. Depending on the apparatus, the line at 217.0 nm may be used.

Silver. To 2.0 g add 1 ml of *water R* and 4 ml of *nitric acid R*. Heat gently until dissolved and dilute to 11 ml with *water R*. Cool and add 2 ml of 1 M *hydrochloric acid*. Allow to stand for 5 min, protected from light. Any opalescence in the solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 10 ml of *silver standard solution (5 ppm Ag) R*, 1 ml of *nitric acid R* and 2 ml of 1 M *hydrochloric acid* (25 ppm).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

ASSAY

Dissolve 0.500 g in 3 ml of *nitric acid R* and dilute to 250 ml with *water R*. Carry out the complexometric titration of bismuth (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 20.90 mg of Bi.

STORAGE

Store protected from light.

01/2005:1493

BISMUTH SUBGALLATE

Bismuthi subgallas

 $C_7H_5BiO_6$
 M_r 394.1

DEFINITION

Complex of bismuth and gallic acid.

Content: 48.0 per cent to 51.0 per cent of Bi (A_r 209.0) (dried substance).

CHARACTERS

Appearance: yellow powder.

Solubility: practically insoluble in water and in alcohol. It dissolves in mineral acids with decomposition and in solutions of alkali hydroxides, producing a reddish-brown liquid.

IDENTIFICATION

- A. Mix 0.1 g with 5 ml of *water R* and 0.1 ml of *phosphoric acid R*. Heat to boiling and maintain boiling for 2 min. Cool and filter. To the filtrate, add 1.5 ml of *ferric chloride solution R1*, a blackish-blue colour develops.
- B. It gives reaction (b) of bismuth (2.3.1).

TESTS

Solution S. In a porcelain or quartz dish, ignite 1.0 g, increasing the temperature very gradually. Heat in a muffle furnace at 600 ± 25 °C for 2 h. Cool and dissolve the residue with warming in 4 ml of a mixture of equal volumes of *lead-free nitric acid R* and *water R* and dilute to 20 ml with *water R*.

Acidity. Shake 1.0 g with 20 ml of *water R* for 1 min and filter. To the filtrate add 0.1 ml of *methyl red solution R*. Not more than 0.15 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to yellow.

Chlorides (2.4.4): maximum 200 ppm.

To 0.5 g add 10 ml of *dilute nitric acid R*. Heat on a water-bath for 5 min and filter. Dilute 5 ml of the filtrate to 15 ml with *water R*.

Nitrates: maximum 0.2 per cent.

To 1.0 g add 25 ml of *water R* then 25 ml of a mixture of 2 volumes of *sulphuric acid R* and 9 volumes of *water R*. Heat at about 50 °C for 1 min with stirring and filter. To 10 ml of the filtrate, carefully add 30 ml of *sulphuric acid R*. The solution is not more intensely brownish-yellow coloured than a reference solution prepared at the same

time as follows: to 0.4 g of *gallic acid R*, add 20 ml of *nitrate standard solution* (100 ppm NO_3) *R* and 30 ml of a mixture of 2 volumes of *sulphuric acid R* and 9 volumes of *water R*, then filter; to 10 ml of the filtrate, carefully add 30 ml of *sulphuric acid R*.

Copper: maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Solution S.

Reference solutions. Prepare the reference solutions using *copper standard solution* (10 ppm Cu) *R* and diluting with a 6.5 per cent V/V solution of *lead-free nitric acid R*.

Source: copper hollow-cathode lamp.

Wavelength: 324.7 nm.

Atomisation device: air-acetylene flame.

Lead: maximum 20 ppm.

Atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Solution S.

Reference solutions. Prepare the reference solutions using *lead standard solution* (10 ppm Pb) *R* and diluting with a 6.5 per cent V/V solution of *lead-free nitric acid R*.

Source: lead hollow-cathode lamp.

Wavelength: 283.3 nm (depending on the apparatus, the line at 217.0 nm may be used).

Atomisation device: air-acetylene flame.

Silver: maximum 25 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Solution S.

Reference solutions. Prepare the reference solutions using *silver standard solution* (5 ppm Ag) *R* and diluting with a 6.5 per cent V/V solution of *lead-free nitric acid R*.

Source: silver hollow-cathode lamp.

Wavelength: 328.1 nm.

Atomisation device: air-acetylene flame.

Substances not precipitated by ammonia: maximum 1.0 per cent.

In a porcelain or quartz dish, ignite 2.0 g, increasing the temperature very gradually to 600 °C; allow to cool. Moisten the residue with 2 ml of *nitric acid R*, evaporate to dryness on a water-bath and carefully heat and ignite once more at 600 °C. After cooling, dissolve the residue in 5 ml of *nitric acid R* and dilute to 20 ml with *water R*. To 10 ml of this solution, add *concentrated ammonia R* until alkaline and filter. Wash the residue with *water R*, evaporate the combined filtrate and washings to dryness on a water-bath and add 0.3 ml of *dilute sulphuric acid R*. Ignite, the residue weighs a maximum of 10 mg.

Loss on drying (2.2.32): maximum 7.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

ASSAY

To 0.300 g add 10 ml of a mixture of equal volumes of *nitric acid R* and *water R*, heat to boiling and maintain boiling for 2 min. Add 0.1 g of *potassium chlorate R*, heat to boiling and maintain boiling for 1 min. Add 10 ml of *water R* and heat until the solution becomes colourless. To the hot solution, add 200 ml of *water R* and 50 mg of *xylene orange triturate R*. Titrate with 0.1 M *sodium edetate* until a yellow colour is obtained.

1 ml of 0.1 M *sodium edetate* is equivalent to 20.90 mg of Bi.

STORAGE

Protected from light.

01/2005:1494

BISMUTH SUBNITRATE, HEAVY**Bismuthi subnitras ponderosum** $4[\text{BiNO}_3(\text{OH})_2] \cdot \text{BiO}(\text{OH})$ M_r 1462**DEFINITION**

Heavy bismuth subnitrate contains not less than 71.0 per cent and not more than 74.0 per cent of Bi (A_r 209.0), calculated with reference to the dried substance.

CHARACTERS

A white powder, practically insoluble in water and in alcohol. It dissolves in mineral acids with decomposition.

IDENTIFICATION

- A. Dilute 1 ml of solution S1 (see Tests) to 5 ml with *water R*, add 0.3 ml of *potassium iodide solution R*. A black precipitate is formed which dissolves into an orange solution with the addition of 2 ml of *potassium iodide solution R*.
- B. It gives reaction (b) of bismuth (2.3.1).
- C. It gives the reaction of nitrates (2.3.1).
- D. The pH (2.2.3) of solution S2 (see Tests) is not more than 2.0.

TESTS

Solution S1. Shake 5.0 g by gently heating in 10 ml of *water R*, add 20 ml of *nitric acid R*. Heat until dissolution, cool and dilute to 100 ml with *water R*.

Solution S2. Place 1.00 g in a 20 ml volumetric flask and add 2.0 ml of *lead-free nitric acid R*. Allow acid attack to take place without heating and if necessary warm slightly at the end to dissolve the test sample completely. Add 10 ml of *water R*, shake and add, in small fractions, 4.5 ml of *lead-free ammonia R*; shake, allow to cool, dilute to 20.0 ml with *water R*, shake again and allow the solids to settle. The clear supernatant solution is solution S2.

Acidity. Suspend 1.0 g in 15 ml of *water R* and shake several times. Allow to stand for 5 min and filter. To 10 ml of the filtrate, add 0.5 ml of *phenolphthalein solution R1*. Not more than 0.5 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Chlorides (2.4.4). To 5.0 ml of solution S1, add 3 ml of *nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Copper. Not more than 50 ppm of Cu, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Solution S2.

Reference solutions. Prepare the reference solutions using *copper standard solution* (10 ppm Cu) *R* and diluting with a 37 per cent V/V solution of *lead-free nitric acid R*.

Measure the absorbance at 324.7 nm using a copper hollow-cathode lamp as source of radiation and an air-acetylene flame.

Lead. Not more than 20 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Solution S2.

Reference solutions. Prepare the reference solutions using appropriate quantities of *lead standard solution* (10 ppm Pb) *R* and diluting with a 37 per cent V/V solution of *lead-free nitric acid R*.

Measure the absorbance at 283.3 nm, using a lead hollow-cathode lamp as source of radiation and an air-acetylene flame. Depending on the apparatus, the line at 217.0 nm may be used.

Silver. Not more than 25 ppm of Ag, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Solution S2.

Reference solutions. Prepare the reference solutions using *silver standard solution* (5 ppm Ag) *R* and diluting with a 37 per cent V/V solution of *lead-free nitric acid R*.

Measure the absorbance at 328.1 nm using a silver hollow-cathode lamp as source of radiation and an air-acetylene flame.

Substances not precipitated by ammonia. To 20 ml of solution S1, add *concentrated ammonia R* until alkaline and filter. Wash the residue with *water R*, and evaporate the combined filtrate and washings to dryness on a water-bath. Add 0.3 ml of *dilute sulphuric acid R* and ignite. The residue weighs not more than 10 mg (1.0 per cent).

Loss on drying (2.2.32). Not more than 3.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

ASSAY

Dissolve with heating 0.250 g in 10 ml of a mixture of 2 volumes of *perchloric acid R* and 5 volumes of *water R*. To the hot solution, add 200 ml of *water R* and 50 mg of *xylenol orange triturate R*. Titrate with 0.1 M *sodium edetate* until a yellow colour is obtained.

1 ml of 0.1 M *sodium edetate* is equivalent to 20.90 mg of Bi.

01/2005:1495

BISMUTH SUBSALICYLATE**Bismuthi subsalicylas** $\text{C}_7\text{H}_5\text{BiO}_4$ M_r 362.1**DEFINITION**

Complex of bismuth and salicylic acid.

Content: 56.0 per cent to 59.4 per cent of Bi (A_r 209.0) (dried substance).

CHARACTERS

Appearance: white powder.

Solubility: practically insoluble in water and in alcohol. It dissolves in mineral acids with decomposition.

IDENTIFICATION

- A. To 0.5 g add 10 ml of *hydrochloric acid R1*. Heat on a boiling water-bath for 5 min. Cool and filter. Retain the filtrate for identification test B. Wash the residue with *dilute hydrochloric acid R* and then with *water R*. Dissolve the residue in 0.5-1 ml of *dilute sodium hydroxide solution R*. Add 15 ml of *water R*. Neutralise with *dilute hydrochloric acid R*. The solution gives reaction (a) of salicylates (2.3.1).
- B. The filtrate obtained in identification test A gives reaction (b) of bismuth (2.3.1).

TESTS

Solution S. In a porcelain or quartz dish, ignite 1.0 g, increasing the temperature very gradually. Heat in a muffle furnace at 600 ± 25 °C for 2 h. Cool and dissolve the residue with warming in 4 ml of a mixture of equal volumes of *lead-free nitric acid R* and *water R* and dilute to 20 ml with *water R*.

Acidity. Shake 2.0 g with 30 ml of *ether R* for 1 min and filter. To the filtrate add 30 ml of *alcohol R* and 0.1 ml of *thymol blue solution R*. Not more than 0.35 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Chlorides (2.4.4): maximum 200 ppm.

Dissolve 0.250 g in a mixture of 2 ml of *nitric acid R*, 5 ml of *water R* and 8 ml of *methanol R*.

Nitrates: maximum 0.4 per cent.

To 0.1 g add 10 ml of *water R* and, with caution, 20 ml of *sulphuric acid R* and stir. The solution is not more intensely yellow coloured than a reference solution prepared at the same time using 0.1 g of *salicylic acid R*, 6 ml of *water R*, 4 ml of *nitrate standard solution* (100 ppm NO_3^-) *R* and 20 ml of *sulphuric acid R*.

Copper: maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Solution S.

Reference solutions. Prepare the reference solutions using *copper standard solution* (10 ppm Cu) *R* and diluting with a 6.5 per cent V/V solution of *lead-free nitric acid R*.

Source: copper hollow-cathode lamp.

Wavelength: 324.7 nm.

Atomisation device: air-acetylene flame.

Lead: maximum 20 ppm.

Atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Solution S.

Reference solutions. Prepare the reference solutions using *lead standard solution* (10 ppm Pb) *R* and diluting with a 6.5 per cent V/V solution of *lead-free nitric acid R*.

Source: lead hollow-cathode lamp.

Wavelength: 283.3 nm (depending on the apparatus, the line at 217.0 nm may be used).

Atomisation device: air-acetylene flame.

Silver: maximum 25 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Solution S.

Reference solutions. Prepare the reference solutions using *silver standard solution* (5 ppm Ag) *R* and diluting with a 6.5 per cent V/V solution of *lead-free nitric acid R*.

Source: silver hollow-cathode lamp.

Wavelength: 328.1 nm.

Atomisation device: air-acetylene flame.

Soluble bismuth: maximum 40 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Suspend 5.0 g in 100 ml of *water R*. Stir constantly for 2 h at 20–23 °C. Filter through filter paper (slow filtration) then through a cellulose micropore membrane filter (0.1 µm). To 10.0 ml of clear filtrate, add 0.1 ml of *nitric acid R*.

Reference solutions. Prepare the reference solutions using *bismuth standard solution* (100 ppm Bi) *R* and diluting with a mixture of equal volumes of *dilute nitric acid R* and *water R*.

Source: bismuth hollow-cathode lamp.

Wavelength: 223.06 nm.

Atomisation device: air-acetylene flame.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve with heating 0.300 g in 10 ml of a mixture of 2 volumes of *perchloric acid R* and 5 volumes of *water R*. To the hot solution, add 200 ml of *water R* and 50 mg of *xylene orange triturate R*. Titrate with 0.1 M *sodium edetate* until a yellow colour is obtained.

1 ml of 0.1 M *sodium edetate* is equivalent to 20.90 mg of Bi.

STORAGE

Protected from light.

01/2005:1826

BITTER-FENNEL FRUIT OIL

Foeniculi amari fructus aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the ripe fruits of *Foeniculum vulgare* Miller, ssp. *vulgare* var. *vulgare*.

Content:

- fenchone: 12.0 per cent to 25.0 per cent,
- *trans*-anethole: 55.0 per cent to 75.0 per cent.

CHARACTERS

Appearance: clear, colourless or pale yellow liquid.

It has a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.1 ml of the oil to be examined in 5 ml of *toluene R*.

Reference solution. Dissolve 10 µl of *fenchone R* and 80 µl of *anethole R* in 5 ml of *toluene R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *ethyl acetate R*, *toluene R* (5:95 V/V).

Application: 10 µl as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a freshly prepared 200 g/l solution of *phosphomolybdic acid R* in *ethanol* (96 per cent) *R* and heat at 150 °C for 15 min; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a dark blue to dark violet zone	A dark blue to dark violet zone (anethole)
_____	_____
Fenchone: a blue or bluish-grey zone	A blue or bluish-grey zone (fenchone)
_____	_____
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.961 to 0.975.

Refractive index (2.2.6): 1.528 to 1.539.

Optical rotation (2.2.7): + 10.0° to + 24.0°.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dissolve 0.20 ml of the oil to be examined in *heptane R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 20 µl of *α-pinene R*, 20 µl of *limonene R*, 50 µl of *fenchone R*, 20 µl of *estragole R*, 100 µl of *anethole R* and 20 µl of *anisaldehyde R* in *heptane R* and dilute to 10.0 ml with the same solvent.

Column:

- **material:** fused silica,
- **size:** *l* = 60 m, *Ø* = 0.25 mm,
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:200.

Temperature:

	Time (min)	Temperature (°C)
Column	0 – 4	60
	4 – 26	60 → 170
	26 – 41	170
Injection port		220
Detector		270

Detection: flame ionisation.

Injection: 1.0 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

- **resolution:** minimum 5.0 between the peaks due to *estragole* and *trans-anethole*.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution and locate *cis-anethole* using Figure 1826-1. (Disregard the peak due to *heptane*).

Determine the percentage content of each of these components. The percentages are within the following ranges:

- *α-pinene*: 1.0 per cent to 10.0 per cent,
- *limonene*: 0.9 per cent to 5.0 per cent,
- *fenchone*: 12.0 per cent to 25.0 per cent,
- *estragole*: maximum 6.0 per cent,

Figure 1826-1. – Chromatogram for the test for chromatographic profile of bitter-fennel fruit oil

- *cis-anethole*: maximum 0.5 per cent,
- *trans-anethole*: 55.0 per cent to 75.0 per cent,
- *anisaldehyde*: maximum 2.0 per cent.

The ratio of α -pinene content to limonene content is greater than 1.0.

STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

01/2005:1603

BITTER-ORANGE EPICARP AND MESOCARP

Aurantii amari epicarpium et mesocarpium

DEFINITION

Dried epicarp and mesocarp of the ripe fruit of *Citrus aurantium* L. ssp. *aurantium* (*C. aurantium* L. ssp. *amara* Engl.) partly freed from the white spongy tissue of the mesocarp and endocarp.

Content: minimum 20 ml/kg of essential oil (anhydrous drug).

CHARACTERS

Aromatic odour and spicy bitter taste.

Macroscopic and microscopic characters described under identification A and B.

IDENTIFICATION

- The drug consists of elliptical to irregular pieces 5 cm to 8 cm long, 3 cm to 5 cm broad and about 3 mm thick. The outer surface is yellowish to reddish-brown and distinctly punctate, the inner surface is yellowish to brownish-white.
- Reduce to a powder (355). The powder is light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows small polygonal cells with slightly thickened anticlinal walls, filled with orange-red chromatophores, and very occasional anomocytic stomata (2.8.3); fragments of the hypodermic showing collenchymatous thickening; groups of parenchyma with each cell containing a prism crystal of calcium oxalate; fragments of lysigenous oil glands; parenchyma containing crystals of hesperidin which dissolve in a 20 g/l *potassium hydroxide R* solution giving a yellow colour.

- Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (710) add 10 ml of *methanol R* and heat in a water-bath at 65 °C for 5 min shaking frequently. Allow to cool and filter.

Reference solution. Dissolve 1.0 mg of *naringin R* and 1.0 mg of *caffeic acid R* in 1 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *water R*, *anhydrous formic acid R*, *ethyl acetate R* (10:15:75 V/V/V).

Application: 20 μ l, as bands.

Development: over a path of 10 cm.

Drying: in air, and heat in an oven at 110-120 °C for 5 min.

Detection: spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. After at least 1 h, examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	A light blue fluorescent zone
	A light blue fluorescent zone
Naringin: a dark green fluorescent zone	A light blue fluorescent zone
	A light blue fluorescent zone
	A dark green fluorescent zone (naringin)
	A red fluorescent zone (neoeriocitrin)
	An orange fluorescent zone
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): it complies with the test for foreign matter.

Water (2.2.13): maximum 10.0 per cent, determined on 20.0 g of powdered drug (355) by distillation.

Total ash (2.4.16): maximum 7.0 per cent

Extractable matter: minimum 6.0 per cent.

To 2.000 g of the powdered drug (250) add a mixture of 3 ml of *water R* and 7 ml of *alcohol R* and extract for 2 h, shaking frequently. Filter, evaporate 2.000 g of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 3 h. Allow to cool in a desiccator over *diphosphorus pentoxide R* and weigh. The residue weighs a minimum of 120 mg.

ASSAY

Carry out the determination of essential oil in vegetable drugs (2.8.12). Use a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Reduce the drug to a powder (710) and immediately use 15.0 g for the determination. Distil at a rate of 2-3 ml/min for 90 min.

01/2005:1604

BITTER-ORANGE-EPICARP AND MESOCARP TINCTURE

Aurantii amari epicarpium et mesocarpium tinctura

DEFINITION

Tincture produced from *Bitter-orange epicarp and mesocarp* (1603).

PRODUCTION

The tincture is produced from 1 part of the freshly powdered drug (2000) and 5 parts of *alcohol* (70 per cent V/V/V) by an appropriate procedure.

CHARACTERS

Liquid with a bitter taste.

IDENTIFICATION

Examine by thin-layer chromatography (2.2.27).

Test solution. The tincture to be examined.

Reference solution. Dissolve 1.0 mg of *naringin R* and 1.0 mg of *caffeic acid R* in 1 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *water R, anhydrous formic acid R, ethyl acetate R* (10:15:75 *V/V/V*).

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: in air, and heat in an oven at 110-120 °C for 5 min.

Detection: spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. After 1 h, examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	A light blue fluorescent zone
	A light blue fluorescent zone
	A light blue fluorescent zone
	A light blue fluorescent zone
Naringin: a dark green fluorescent zone	A dark green fluorescent zone (naringin)
	A red fluorescent zone (neoneriocitrin)
	An orange fluorescent zone
Reference solution	Test solution

TESTS

Ethanol content (2.9.10): 63 per cent to 67 per cent *V/V*.

Methanol and 2-propanol (2.9.11): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

Dry residue: minimum 6.0 per cent *m/m*, determined on 2.00 g of tincture to be examined.

01/2005:1810

BITTER-ORANGE FLOWER

Aurantii amari flos

DEFINITION

Whole, dried, unopened flower of *Citrus aurantium* L. ssp. *aurantium* (*C. aurantium* L. ssp. *amara* Engl.).

Content: minimum 8.0 per cent of total flavonoids, expressed as naringin ($C_{27}H_{32}O_{14}$; M_r 580.5) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The flower buds are white or yellowish-white and may reach up to 25 mm in length. The dialypetalous corolla is composed of 5 thick, oblong and concave petals dotted with oil glands visible under a hand lens; the short, yellowish-green persistent gamosepalous calyx has 5 spreading sepals, connate at the base and forming a star-shaped structure attached to the yellowish-green

peduncle which is about 5 mm to 10 mm long. The flower buds contain at least 20 stamens with yellow anthers and with filaments fused at the base into groups of 4 or 5; the ovary is superior, brownish-black and spherical, consists of 8 to 10 multi-ovular loculi and is surrounded at the base by an annular granular hypogynous disc; the thick, cylindrical style ends in a capitate stigma.

B. Reduce to a powder (355). The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous spherical pollen grains, with a finely pitted exine and 3 to 5 germinal pores; fragments of the epidermis of the sepals with unicellular trichomes and with large prism crystals of calcium oxalate in the underlying mesophyll; fragments of the epidermis of the petals with a distinctly striated cuticle; fragments of large schizolysigenous oil glands which measure up to 100 µm in diameter, numerous anomocytic stomata (2.8.3). Examine under a microscope using a 300 g/l solution of *potassium hydroxide R*. The powder shows yellow crystals of hesperidin.

C. Examine the chromatograms obtained in the test for sweet-orange flower.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Hesperidin: a greenish-yellow fluorescent zone Naringin: a yellow fluorescent zone	A weak yellow fluorescent zone
	A weak yellow fluorescent zone
	A greenish-yellow fluorescent zone (hesperidin)
	A yellow fluorescent zone (naringin)
	A red fluorescent zone (neoneriocitrin)
	A yellow fluorescent zone (diosmin and neodiosmin)
Reference solution	Test solution

TESTS

Sweet-orange flower. Thin-layer chromatography (2.2.27).

Test solution. To 0.5 g of the powdered drug (355), add 5 ml of *methanol R*. Heat with stirring at 40 °C for 10 min. Filter.

Reference solution. Dissolve 3.0 mg of *naringin R* and 3.0 mg of *hesperidin R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *water R, anhydrous formic acid R, ethyl acetate R* (10:15:75 *V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air, then heat in an oven at 110-120 °C for 5 min.

Detection: spray the hot plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. After at least 1 h, examine in ultraviolet light at 365 nm.

Results: the chromatogram obtained with the test solution shows a yellow zone similar in position to the zone of naringin in the chromatogram obtained with the reference solution and immediately below it a red zone (neoneriocitrin).

Foreign matter (2.8.2): maximum 2 per cent.

Loss on drying (2.2.32): maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C.

Total ash (2.4.16): maximum 10.0 per cent.

ASSAY

Stock solution. To 0.175 g of the powdered drug (355) add 95 ml of *alcohol (50 per cent V/V) R*. Heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter through a sintered-glass filter. Rinse the filter with 5 ml of *alcohol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 ml with *alcohol (50 per cent V/V) R*.

Test solution. Into a test tube (10 mm × 180 mm) introduce 0.150 g of powdered (250) *magnesium R*, a magnetic stirring bar 25 mm long and 2.00 ml of the stock solution. Maintain the test tube upright, centrifuge at 125 *g* and carefully add dropwise, especially at the beginning, 2.0 ml of *hydrochloric acid R*, and then 6.0 ml of *alcohol (50 per cent V/V) R*. Stopper the tube and mix by inverting.

Compensation solution. Into a second tube, introduce 2.00 ml of the stock solution and carefully add dropwise, especially at the beginning, 2.0 ml of *hydrochloric acid R* and then 6.0 ml of *alcohol (50 per cent V/V) R*.

After 10 min, measure the absorbance (2.2.25) of the test solution at 530 nm.

Calculate the percentage content of total flavonoids, expressed as naringin, from the expression:

$$\frac{A \times 9.62}{m}$$

i.e. taking the value of the specific absorbance of the reaction product of naringin to be 52.

A = absorbance at 530 nm,

m = mass of the substance to be examined, in grams.

01/2005:1175

BITTER-ORANGE-FLOWER OIL

Aurantii amari floris aetheroleum

DEFINITION

Bitter-orange-flower oil is obtained by steam distillation from the fresh flowers of *Citrus aurantium* L. subsp. *aurantium* (*C. aurantium* L. subsp. *amara* Engl.).

CHARACTERS

A clear, pale-yellow or dark-yellow liquid, with a characteristic odour reminiscent of bitter-orange flowers, miscible with alcohol, with light petroleum, with fatty oils and with liquid paraffin.

IDENTIFICATION

First identification: *B*.

Second identification: *A*.

A. Examine in ultraviolet light at 365 nm the chromatograms obtained in the test for bergapten. Before spraying with the reagent, the chromatogram obtained with the test solution shows a band similar in position and fluorescence to that corresponding to methyl anthranilate in the chromatogram obtained with the reference solution. Other bands may be visible. Examine in ultraviolet light at 365 nm after spraying with the reagent. The chromatogram obtained with the reference solution shows in the upper half a band of brownish-orange fluorescence corresponding to linalyl acetate, in the lower half a band of brownish-orange fluorescence corresponding to linalol and immediately below, a band of yellow-greenish fluorescence corresponding to bergapten.

The chromatogram obtained with the test solution shows two bands similar in position and fluorescence to the bands corresponding to linalyl acetate and to linalol in the chromatogram obtained with the reference solution. Other bands may also be present.

B. Examine the chromatograms obtained in the test for chromatographic profile. The retention times of the principal peaks in the chromatogram obtained with the test solution are approximately the same as those of the peaks in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.866 to 0.880.

Refractive index (2.2.6): 1.468 to 1.474.

Optical rotation (2.2.7): + 1.5° to + 11.5°.

Acid value (2.5.1). Not more than 2.0.

Bergapten. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *alcohol R* and dilute to 5.0 ml with the same solvent.

Reference solution. Dissolve 5 µl of *methyl anthranilate R*, 10 µl of *linalol R*, 20 µl of *linalyl acetate R* and 10 mg of *bergapten R* in *alcohol R* and dilute to 10.0 ml with the same solvent.

Apply separately to the plate, as bands, 10 µl of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of *ethyl acetate R* and 85 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in the middle a band of blue fluorescence (methyl anthranilate) and below a band of greenish-yellow fluorescence (bergapten). Spray with *anisaldehyde solution R*. Heat the plate at 100 °C to 105 °C for 10 min. Examine in ultraviolet light at 365 nm. The chromatogram obtained with the test solution does not show a band corresponding to that due to bergapten (essential oil of bitter-orange peel) in the chromatogram obtained with the reference solution.

Chromatographic profile. Examine by gas chromatography (2.2.28).

Test solution. The substance to be examined.

Reference solution. Dissolve 20 µl of *β-pinene R*, 5 µl of *sabinene R*, 40 µl of *limonene R*, 40 µl of *linalol R*, 20 µl of *linalyl acetate R*, 5 µl of *α-terpineol R*, 5 µl of *neryl acetate R*, 5 µl of *geranyl acetate R*, 5 µl of *trans-nerolidol R* and 5 µl of *methyl anthranilate R* in 1 ml of *hexane R*.

The chromatographic procedure may be carried out using:

- a fused-silica capillary column 25 m to 60 m long and about 0.25 mm in internal diameter, impregnated with *macrogol 20 000 R* as the bonded phase,
- *helium for chromatography R* as the carrier gas at a flow rate of 1.5 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100,

maintaining the temperature of the column at 75 °C for 4 min, then raising the temperature at a rate of 4 °C/min to 230 °C and maintaining at 230 °C for 20 min, maintaining the temperature of the injection port and of the detector at 270 °C.

Inject about 0.1 µl of the reference solution. When the chromatograms are recorded in the prescribed conditions, the components elute in the order indicated in the composition of the reference solution. Record the retention times of these substances.

The test is not valid unless: the number of theoretical plates is not less than 30 000, calculated from the limonene peak at 110 °C; the resolution between the peaks due to β -pinene and to sabinene is not less than 1.5.

Inject about 0.2 μ l of the substance to be examined. Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution (disregard the peak due to hexane).

Determine the percentage content of each of these components by the normalisation procedure.

The percentages are within the following ranges:

- *β -pinene*: 7.0 per cent to 17.0 per cent,
- *limonene*: 9.0 per cent to 18.0 per cent,
- *linalol*: 18.0 per cent to 42.0 per cent,
- *linalyl acetate*: 3.0 per cent to 16.0 per cent,
- *α -terpineol*: 2.0 per cent to 7.0 per cent,
- *neryl acetate*: 1.0 per cent to 3.0 per cent,
- *geranyl acetate*: 1.5 per cent to 4.0 per cent,
- *trans-nerolidol*: 1.0 per cent to 9.0 per cent,
- *methhyl anthranilate*: 0.1 per cent to 1.0 per cent.

STORAGE

Store in a well-filled, airtight container, protected from light and heat.

01/2005:1858

BLACK HOREHOUND

Ballotae nigrae herba

DEFINITION

Dried flowering tops of *Ballota nigra* L.

Content: minimum 1.5 per cent of total *ortho*-dihydroxycinnamic acid derivatives, expressed as acteoside ($C_{29}H_{36}O_{15}$; M_r 624.6) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. Stems conspicuously four-angled, longitudinally striated, dark green or reddish-brown and more or less pubescent. Leaves greyish-green, petiolate, lamina ovate to orbicular, 2 cm to 4 cm wide, margin irregularly crenate, cuneate to cordate at the base; both surfaces covered with abundant whitish hairs; venation pinnate, prominent on the lower surface, slightly depressed on the upper. Flowers sessile or very shortly pedicellate, calyx infundibuliform, densely pubescent, with 10 prominent ribs and 5 subequal, broadly ovate teeth; corolla purple, tube slightly shorter than the calyx tube, bilabiate, the upper lip pubescent on the outer surface, the lower lip with 3 lobes, the middle lobe notched.
- B. Reduce to a powder (355). The powder is greyish-green and slightly flocculent. Examine under a microscope using *chloral hydrate solution R*. The powder shows numerous long, uniseriate, multicellular covering trichomes consisting of 4 or more cells, thickened and swollen at the junctions, with slightly lignified and pitted walls; fewer glandular trichomes, some with a unicellular or multicellular stalk and a globose, uni- or bicellular head, others with a unicellular stalk and a multicellular

head; fragments of the leaf epidermis with sinuous walls, those from the lower epidermis with numerous stomata, some diacytic (2.8.3) but the majority anomocytic; epidermis of the corolla composed of polygonal cells, those of the inner epidermis papillose; pollen grains subspherical with 3 pores and a smooth exine; groups of collenchyma and lignified, spirally thickened and bordered pitted vessels, from the stem.

C. Thin-layer chromatography (2.2.27).

Test solution. To 2 g of the powdered drug (355) add 100 ml of *methanol R*. Heat on a water-bath under a reflux condenser for 30 min. Allow to cool. Filter. Evaporate the filtrate under reduced pressure until a volume of about 10 ml is obtained.

Reference solution. Dissolve 2.5 mg of *rutin R* and 1 mg of *chlorogenic acid R* in 10 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:18:67 V/V/V/V).

Application: 20 μ l, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a solution containing 10 g/l of *diphenylboric acid aminoethyl ester R* and 50 g/l of *macrogol 400 R* in *methanol R*. Allow to dry in a current of warm air. Examine in ultraviolet light at 365 nm after 30 min.

Results: see below the sequence of the zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Chlorogenic acid: a light blue fluorescent zone Rutin: an orange-yellow fluorescent zone	A reddish fluorescent zone
	A faint yellow fluorescent zone
	A light blue fluorescent zone (caffeoylmalic acid)
	A greenish-blue fluorescent zone (acteoside)
	A yellow-brown fluorescent zone (luteolin 7-lactate)
	A greenish-blue fluorescent zone (forsythoside B)
	2 greenish-blue fluorescent zones (arenarioside)
	A yellow fluorescent zone (luteolin 7-lactate glucoside).
	A faint greenish-blue fluorescent zone (ballotetroside).
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 2 per cent *m/m*.

Loss on drying (2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 13.0 per cent.

ASSAY

Stock solution. Place 1.000 g of the powdered drug (355) in a flask. Add 90 ml of *alcohol (50 per cent V/V) R*. Heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter collecting the filtrate into a 100 ml

volumetric flask. Rinse the flask and the filter with 10 ml of *alcohol* (50 per cent V/V) *R*. Add the rinsings to the filtrate and dilute to 100.0 ml with *alcohol* (50 per cent V/V) *R*.

Test solution. In a 10 ml volumetric flask add successively, with shaking after each addition, 1.0 ml of the stock solution, 2 ml of 0.5 *M* hydrochloric acid, 2 ml of a solution containing 100 g/l of sodium nitrite *R* and 100 g/l of sodium molybdate *R*, 2 ml of dilute sodium hydroxide solution *R* and dilute to 10.0 ml with water *R*.

Compensation liquid. In a 10 ml volumetric flask, add 1.0 ml of the stock solution, 2 ml of 0.5 *M* hydrochloric acid, 2 ml of dilute sodium hydroxide solution *R* and dilute to 10.0 ml with water *R*.

Measure immediately the absorbance (2.2.25) of the test solution, by comparison with the compensation liquid at 525 nm.

Calculate the percentage content of total *ortho*-dihydroxycinnamic acid derivatives, calculated as acteoside, from the expression:

$$\frac{A \times 1000}{185 \times m}$$

i.e. taking the specific absorbance of acteoside to be 185 at 525 nm.

A = absorbance of the test solution at 525 nm,

m = mass of the substance to be examined, in grams.

01/2005:0976

BLEOMYCIN SULPHATE

Bleomycini sulfas

DEFINITION

Bleomycin sulphate is the sulphate of a mixture of glycopeptides produced by *Streptomyces verticillus* or by any other means; the two principal components of the mixture are *N*1-[3-(dimethylsulphonio)propyl]bleomycinamide (bleomycin A₂) and *N*1-4-(guanidobutyl)bleomycinamide (bleomycin B₂). The potency is not less than 1500 IU/mg, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, very hygroscopic, very soluble in water, slightly soluble in ethanol, practically insoluble in acetone.

IDENTIFICATION

A. Examine the chromatograms obtained in the test for composition. The retention times and sizes of the two principal peaks in the chromatogram obtained with the test solution are approximately the same as those of the two principal peaks in the chromatogram obtained with reference solution (a).

B. It gives the reactions of sulphates (2.3.1).

TESTS

Appearance of solution. Dissolve 0.200 g in water *R* and dilute to 10.0 ml with the same solvent. The solution is clear (2.2.1). The absorbance (2.2.25) measured at 430 nm is not greater than 0.10.

pH (2.2.3). Dissolve 50 mg in carbon dioxide-free water *R* and dilute to 10 ml with the same solvent. The pH of the solution is 4.5 to 6.0.

Composition. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in water *R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 25.0 mg of bleomycin sulphate CRS in water *R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 1.5 ml of reference solution (a) to 100.0 ml with water *R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with octadecylsilyl silica gel for chromatography *R* (7 µm),
- gradient elution at a flow rate of 1.2 ml/min with a mobile phase initially composed of 10 per cent V/V of methanol *R* and 90 per cent V/V of a mixture prepared as follows: dissolve 0.960 g of sodium pentanesulphonate *R* in 900 ml of acetic acid (4.8 g/l C₂H₄O₂), add 1.86 g of sodium edetate *R*, dilute to 1000 ml with the same solvent and adjust to pH 4.3 using ammonia *R*; increasing the proportion of methanol *R* to 40 per cent V/V over 60 min and continuing with the final mixture for about 20 min, until demethylbleomycin A₂ is eluted (retention time 1.5 to 2.5, relative to bleomycin A₂),
- as detector a spectrophotometer set at 254 nm,
- a 20 µl loop injector.

Inject reference solution (a). The test is not valid unless the resolution between the two principal peaks is at least 5. Inject reference solution (b). The test is not valid unless the signal-to-noise ratio calculated for the principal peak is at least 20.

Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the area of the principal peak is at most 2 per cent.

Inject the test solution. The composition, calculated by the normalisation procedure and disregarding any peak with an area less than 0.1 per cent of the total, is: bleomycin A₂ (first principal peak) 55 per cent to 70 per cent; bleomycin B₂ (second principal peak) 25 per cent to 32 per cent; sum of bleomycin A₂ and bleomycin B₂ not less than 85 per cent; demethylbleomycin A₂ (retention time relative to bleomycin A₂ 1.5 to 2.5) not more than 5.5 per cent; other related substances not more than 9.5 per cent.

Copper. Not more than 200 ppm of Cu, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 50 mg in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dilute 1.0 ml of *copper standard solution (10 ppm Cu) R* to 10.0 ml with *water R*.

Measure the absorbance at 324.7 nm using a copper hollow-cathode lamp as source of radiation and an air-acetylene flame.

Loss on drying (2.2.32). Not more than 3.0 per cent, determined on 50 mg by drying at 60 °C at a pressure not exceeding 670 Pa for 3 h.

Bacterial endotoxins (2.6.14): less than 5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2), using the diffusion method. Use *bleomycin sulphate CRS* as the reference substance.

STORAGE

Store in an airtight container, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. R = OH: bleomycinic acid,
 B. R = NH-[CH₂]₃-NH-[CH₂]₄-NH₂: bleomycin A₅,
 C. R = NH-[CH₂]₄-NH-C(=NH)-NH-[CH₂]₄-NH-C(=NH)-NH₂: bleomycin B₄,
 D. R = NH-[CH₂]₃-S-CH₃: demethylbleomycin A₂.

01/2005:1605

BOGBEAN LEAF

Menyanthidis trifoliatae folium

DEFINITION

Dried, entire or fragmented leaf of *Menyanthes trifoliata* L.

CHARACTERS

Very bitter and persistent taste.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaf is long-petiolated, trifoliate, with long sheaths from the base; the petiole is up to 5 mm in diameter and strongly striated longitudinally. The lamina is divided into equal leaflets, sessile, obovate up to 10 cm long and up to 5 cm wide, with an entire, occasionally sinuous margin with brownish or reddish hydathodes and a spatulate base; it is glabrous, dark green on the upper surface and paler green on the lower surface, with a wide, whitish, finely striated prominent midrib.
- B. Reduce to a powder (355). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of upper epidermis with polyhedral cells and thin wavy walls; fragments of lower epidermis with sinuous walls;

anomocytic stomata (2.8.3), on both surfaces, with the subsidiary cells showing radiating striations; epidermal cells from the veins straight walled and papillose; fragments of mesophyll parenchyma with large intercellular spaces (aerenchyma); irregular cells with rare sclereids; fragments of spiral or annular vessels.

C. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (355) add 10 ml of *methanol R*. Heat, with stirring, in a water-bath at 60 °C for 5 min. Allow to cool and filter. Evaporate to dryness under reduced pressure in a water-bath at 60 °C. Dissolve the residue in 2.0 ml of *methanol R*.

Reference solution. Dissolve 5 mg of *loganin R* in 15 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *water R, methanol R, ethyl acetate R* (8:15:77 V/V/V).

Application: 30 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *vanillin reagent R*. Heat in an oven at 100-105 °C for 10 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Loganin: a greyish-violet zone	A violet zone
	An intense blue zone
	A violet to greyish-violet zone
	A grey to greyish-blue zone
	A brownish zone
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): it complies with the test for foreign matter.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 10.0 per cent.

Bitterness value (2.8.15): minimum 3000.

01/2005:1396

BOLDO LEAF

Boldi folium

DEFINITION

Boldo leaf consists of the whole or fragmented dried leaf of *Peumus boldus* Molina. The whole drug contains not less than 20.0 ml/kg and not more than 40.0 ml/kg and the fragmented drug not less than 15.0 ml/kg of essential oil. It contains not less than 0.1 per cent of total alkaloids, expressed as boldine, (C₁₉H₂₁NO₄; *M_r* 327.4), calculated with reference to the anhydrous drug.

CHARACTERS

Boldo leaf has an aromatic odour especially when rubbed.

It has the microscopic and macroscopic characters described under Identification tests A and B.

IDENTIFICATION

A. The leaf is oval or elliptical usually 5 cm long with a short petiole, an obtuse or slightly emarginate or mucronate apex and an equal and rounded base; the margin is entire and slightly undulate and the thickened edges are more or less revolute. The lamina is greyish-green, thick, tough and brittle. The upper surface is rough with numerous prominent small protuberances and a depressed venation. The lower surface is finely pubescent, with the protuberances less well-marked, and a prominent, pinnate venation.

B. Reduce to a powder (355). The powder is greyish-green. Examine under a microscope, using *chloral hydrate solution R*. The powder shows fragments of the upper epidermis and underlying hypodermis with straight or slightly sinuous thickened and beaded walls, those of the lower epidermis with numerous stomata surrounded by four to seven subsidiary cells; solitary, bifurcated or stellate clustered unicellular covering trichomes with more or less thickened and lignified wall; fragments of the lamina showing a two-layered palisade; debris of the spongy mesophyll including numerous, large rounded oil cells and parenchyma containing fine needle-shaped crystals; thick walled fibres and lignified, pitted parenchymatous cells associated with vascular tissue from the veins.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Add to 0.5 g of the powdered drug (355) a mixture of 1 ml of *dilute hydrochloric acid R* and 20 ml of *water R* and heat on a water-bath under reflux for 10 min. Cool and filter. Add to the filtrate 2 ml of *dilute ammonia R1* and extract with two quantities, each of 20 ml of *ether R* avoiding emulsifying. Combine the organic layers and evaporate the solvent on a water-bath. Dissolve the residue in 1.0 ml of *methanol R*.

Reference solution. Dissolve 2 mg of *boldine R* in 5 ml of *methanol R*.

Apply to the plate as bands 20 µl of the test solution and 10 µl of the reference solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R*, 10 volumes of *diethylamine R* and 80 volumes of *toluene R*. Allow the plate to dry in air. Spray the plate with *potassium iodobismuthate solution R2*. Allow the plate to dry in air for 5 min and then spray the plate with *sodium nitrite solution R*. Examine in daylight. The chromatograms show in the lower third the brown to reddish-brown zone of boldine. The chromatogram obtained with the test solution shows several brownish zones above and below the zone corresponding to boldine.

TESTS

Foreign matter (2.8.2). Not more than 4 per cent of twigs and 2 per cent of other foreign matter.

Water (2.2.13). Not more than 100 ml/kg determined by distillation of 20.0 g of the powdered drug (355).

Total ash (2.4.16). Not more than 13.0 per cent.

ASSAY

Essential oil. Carry out the determination of essential oils in vegetable drugs (2.8.12). Use 10.0 g of the freshly crushed drug, a 1000 ml flask and 300 ml of *water R* as the distillation liquid. Distil at a rate of 2 ml/min to 3 ml/min for 3 h.

Alkaloids. Examine by liquid chromatography (2.2.29).

Test solution. To 1.000 g (m_1) of the powdered drug (355) add 50 ml of *dilute hydrochloric acid R*. Shake in a

water-bath at 80 °C for 30 min. Filter, take up the residue with 50 ml of *dilute hydrochloric acid R* and shake in a water-bath at 80 °C for 30 min. Filter and repeat the operation once on the residue obtained. Filter. Combine the cooled filtrates and shake with 100 ml of a mixture of equal volumes of *ethyl acetate R* and *hexane R*. Adjust the aqueous layer to pH 9.5 with *dilute ammonia R1*. Shake successively with 100 ml, 50 ml and 50 ml of *methylene chloride R* and combine the lower layers and evaporate to dryness under reduced pressure. In a 10.0 ml volumetric flask dilute the residue to 10.0 ml with the mobile phase.

Reference solution. In a 100.0 ml volumetric flask dissolve 12 mg (m_2) of *boldine R* in 100.0 ml of the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 16 volumes of solution A and 84 volumes of solution B,

Solution A. Mix 99.8 ml of *acetonitrile R* and 0.2 ml of *diethylamine R*,

Solution B. Mix 99.8 ml of *water R* and 0.2 ml of *diethylamine R*, adjusted to pH 3 with *formic acid R*,

– as detector a spectrophotometer set at 304 nm.

Inject 20 µl of each solution. When the chromatograms are recorded in the prescribed conditions, the retention times relative to boldine are: isoboldine about 0.9; isocorydine *N*-oxide about 1.8; laurotetanine about 2.2; isocorydine about 2.8 and *N*-methyllaurotetanine about 3.2. Additional peaks may be present.

Calculate the percentage content of total alkaloids expressed as boldine from the expression:

$$\frac{\sum A_1 \times m_2}{A_2 \times m_1}$$

m_1 = mass of the substance to be examined, in grams,

m_2 = mass of *boldine R*, in grams,

ΣA_1 = sum of the areas of the peaks due to the six alkaloids identified in the chromatogram obtained with the test solution,

A_2 = area of the peak due to boldine in the chromatogram obtained with the reference solution.

STORAGE

Store protected from light.

01/2005:0013

BORAX

Borax

$\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$

M_r 381.4

DEFINITION

Borax contains not less than 99.0 per cent and not more than the equivalent of 103.0 per cent of disodium tetraborate decahydrate.

CHARACTERS

A white, crystalline powder, colourless crystals or crystalline masses, efflorescent, soluble in water, very soluble in boiling water, freely soluble in glycerol.

IDENTIFICATION

- A. To 1 ml of solution S (see Tests) add 0.1 ml of *sulphuric acid R* and 5 ml of *methanol R* and ignite. The flame has a green border.
- B. To 5 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution is red. On the addition of 5 ml of *glycerol (85 per cent) R* the colour disappears.
- C. Solution S gives the reactions of sodium (2.3.1).

TESTS

Solution S. Dissolve 4.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 9.0 to 9.6.

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (50 ppm). Use 1.0 ml of *acetic acid R* instead of the 0.5 ml prescribed. Prepare the standard using a mixture of 3 ml of *sulphate standard solution (10 ppm SO₄) R* and 12 ml of *distilled water R*.

Ammonium (2.4.1). 6 ml of solution S diluted to 14 ml with *water R* complies with the limit test for ammonium (10 ppm). Prepare the standard using a mixture of 2.5 ml of *ammonium standard solution (1 ppm NH₄) R* and 7.5 ml of *water R*.

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (5 ppm).

Calcium (2.4.3). 15 ml of solution S complies with the limit test for calcium (100 ppm). Prepare the standard using a mixture of 6 ml of *calcium standard solution (10 ppm Ca) R* and 9 ml of *distilled water R*.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (25 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 20 g of *mannitol R* in 100 ml of *water R*, heating if necessary, cool, add 0.5 ml of *phenolphthalein solution R* and neutralise with 0.1 M *sodium hydroxide* until a pink colour is obtained. To this solution add 3.00 g of the substance to be examined, heat until dissolution is complete, cool, and titrate with 1 M *sodium hydroxide* until the pink colour reappears.

1 ml of 1 M *sodium hydroxide* is equivalent to 0.1907 g of Na₂B₄O₇·10H₂O.

01/2005:0001

BORIC ACID

Acidum boricum

H₃BO₃M_r 61.8

DEFINITION

Boric acid contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of H₃BO₃.

CHARACTERS

A white, crystalline powder, colourless, shiny plates greasy to the touch, or white crystals, soluble in water and in alcohol, freely soluble in boiling water and in glycerol (85 per cent).

IDENTIFICATION

- A. Dissolve 0.1 g by gently heating in 5 ml of *methanol R*, add 0.1 ml of *sulphuric acid R* and ignite the solution. The flame has a green border.
- B. Solution S (see Tests) is acid (2.2.4).

TESTS

Solution S. Dissolve 3.3 g in 80 ml of boiling *distilled water R*, cool and dilute to 100 ml with *carbon dioxide-free water R* prepared from *distilled water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 3.8 to 4.8.

Solubility in alcohol. Dissolve 1.0 g in 10 ml of boiling *alcohol R*. The solution is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, *Method II*).

Organic matter. It does not darken on progressive heating to dull redness.

Sulphates (2.4.13). 10 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (450 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (15 ppm). Prepare the standard using a mixture of 2.5 ml of *lead standard solution (2 ppm Pb) R* and 7.5 ml of *water R*.

ASSAY

Dissolve 1.000 g with heating in 100 ml of *water R* containing 15 g of *mannitol R*. Titrate with 1 M *sodium hydroxide*, using 0.5 ml of *phenolphthalein solution R* as indicator, until a pink colour is obtained.

1 ml of 1 M *sodium hydroxide* is equivalent to 61.8 mg of H₃BO₃.

01/2005:2113

BOTULINUM TOXIN TYPE A
FOR INJECTION

Toxinum botulinicum typum A ad iniectabile

DEFINITION

Botulinum toxin type A for injection is a dried preparation containing purified botulinum neurotoxin type A which may be present in the form of a complex with haemagglutinins and non-toxic proteins. Botulinum neurotoxin type A or its haemagglutinin complex is prepared by a suitable purification process of the liquid supernatant from a broth-culture of a suitable strain of *Clostridium botulinum* type A.

The purified complexes consist of several proteins and can be of various sizes. The largest complex (relative molecular mass of about 900 000) consists of a 150 000 relative molecular mass neurotoxin, a 130 000 relative molecular mass non-toxic protein and various haemagglutinins ranging between relative molecular mass 14 000 and 43 000. The purified toxin moiety is composed of only the same 150 000 relative molecular mass neurotoxin as is found in the 900 000 relative molecular mass neurotoxin complex, which is initially produced as a single chain and further cleaved (nicked) by endogenous proteases into a fully active, disulphide-linked, 54 000 relative molecular mass light chain and a 97 000 relative molecular mass heavy chain.

The preparation is reconstituted before use, as stated on the label.

PRODUCTION

GENERAL PROVISIONS

Production of the toxin is based on seed cultures, managed in a defined seed-lot system in which the ability to produce toxin is conserved. The production method must be shown to yield consistently product of activity and profile comparable to that of lots shown in clinical studies to be of adequate safety and efficacy.

The production method is validated to demonstrate that the product, if tested, would comply with the general test of abnormal toxicity (2.6.9) using not less than the maximum human clinical dose, in the presence of a suitable amount of specific botulinum type A antitoxin used for neutralisation.

The production method and stability of the finished product and relevant intermediates are evaluated using the tests below. Such tests include the specific toxin activity per milligram of protein of purified toxin in an appropriate functional model of toxin activity and may be supported by tests confirming the presence of botulinum toxin type A, and, if appropriate, associated non-toxic proteins.

BACTERIAL SEED LOTS

A highly toxigenic strain of *C. botulinum* of known toxin type A and confirmed absence of genes encoding other botulinum toxins (particularly botulinum toxin type B), with known origin and history, is grown using suitable media. The bacterial strain, used for the master seed lot, shall be identified by historical records that include information on its origin and the tests used to characterise the strain. These will include morphological, cultural, biochemical, genetic and serological properties of the strain. The master seed lot and the working seed lot, where applicable, must be demonstrated to have identical profiles. Only a seed lot that complies with the following requirements may be used.

Identification. Each seed lot is identified as containing pure cultures of *C. botulinum* type A bacteria with no extraneous bacterial or fungal contamination.

Microbial purity. Each seed lot complies with the requirements for absence of contaminating micro-organisms. The purity of bacterial cultures is verified by methods of suitable sensitivity. These may include inoculation into suitable media and examination of colony morphology.

Phenotypic parameters. Each seed lot must have a known fatty acid profile, sugar fermentation profile (glucose, lactose, mannose, etc.) and proteolytic activity and must demonstrate relevant lipase, lecithinase and gelatinase activity.

Genetic purity. Each seed lot must have information on the toxin gene sequence and comply with requirements for the absence of other genes encoding other toxin serotypes.

Production of active toxin. A bacterial strain producing a high yield of active toxin, as determined by an acute toxicity assay, is suitable. Seed lots should demonstrate a capability of producing at least a minimum toxicity level appropriate for the manufacturing process and scale.

MANUFACTURER'S REFERENCE PREPARATIONS

During development, reference preparations are established for subsequent verification of batch consistency during production and for control of the bulk purified toxin and finished product. They are derived from representative batches of botulinum toxin type A that are characterised as described under Bulk Purified Toxin.

The reference preparations are suitably characterised for their intended purpose and are stored in suitably sized aliquots under conditions ensuring their suitability.

BULK PURIFIED TOXIN

C. botulinum type A strain is grown anaerobically, in suitable media, from which cultures are selected for step-up incubations under a suitably controlled anaerobic atmosphere through the seed culture and bulk fermentation stages to allow maximum production of toxin. The toxin is purified by suitable methods to remove nucleic acids and components likely to cause adverse reactions.

Only a purified toxin that complies with the following requirements may be used in the preparation of the final bulk. For each test and for each product, limits of acceptance are established and each new purified toxin must comply with these limits.

Residual reagents. Removal of residual reagents used in purification steps is confirmed by suitable limit tests or by validation of the process.

Nucleic acids. Removal of nucleic acids is confirmed by suitable limit tests or by validation of the process.

Immunological identity. The presence of specific type A toxin is confirmed by a suitable immunochemical method (2.7.1).

Specific activity. The specific activity is confirmed in a mouse model of toxicity or by *in vivo/ex vivo* methods validated with respect to the LD₅₀ assay and expressed in mouse LD₅₀ units per milligram of protein. Specific activity must not be less than 1×10^8 mouse LD₅₀ units per milligram of protein for the 150 000 relative molecular mass neurotoxin and must not be less than 1×10^7 mouse LD₅₀ units per milligram of protein for the 900 000 relative molecular mass neurotoxin complex.

Protein. The total protein concentration is determined by a suitable method. An acceptable value is established for the product and each batch must be shown to comply with the limits.

Protein profile. Identity and protein composition are determined by polyacrylamide gel electrophoresis (2.2.31) under reducing or non-reducing conditions or by other suitable physicochemical methods such as size-exclusion chromatography (2.2.30), comparing with suitable reference standards.

Total viable count. It complies with the limits approved for the particular product.

FINAL BULK

The final bulk is prepared by adding approved excipients to the bulk purified toxin. The solution is filtered through a bacteria-retentive filter. If human albumin is added, it complies with the monograph on *Human albumin solution* (0255).

FINAL LOT

The final bulk is distributed aseptically into sterile, tamper-proof containers. Uniformity of fill is verified during filling and the test for uniformity of content (2.9.6) is not required. The containers are closed so as to prevent contamination.

Only a final lot that is within the limits approved for the particular product and is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

pH (2.2.3). The pH of the reconstituted product is within ± 0.5 pH units of the limit approved for the particular product.

Water: not more than the limit approved for the particular product.

IDENTIFICATION

The presence of botulinum toxin type A is confirmed by a suitable immunochemical method (2.7.1).

TESTS

Sterility (2.6.1). It complies with the test for sterility.

Bacterial endotoxins (2.6.14): less than 10 IU per vial.

ASSAY

The potency of the reconstituted product is determined by an LD50 assay in mice or by a method validated with respect to the LD50 assay. The potency is expressed in terms of the LD50 for mice or relative to the reference preparation.

For determination of the LD50, graded doses of the product are injected intraperitoneally into groups of mice and the LD50 is calculated by the usual statistical methods (5.3) from the mouse lethality in each group. A suitable reference preparation is assayed in parallel; the potency of the toxin is expressed relative to the reference or the value found for the reference is within suitable limits defined in terms of the assigned potency.

After validation with respect to the LD50 assay (reference method), the product may also be assayed by other methods that are preferable in terms of animal welfare, including 1 of the following:

1. endopeptidase assay *in vitro*;
2. *ex vivo* assay using the mouse phrenic nerve diaphragm;
3. mouse bioassay using paralysis as the end-point.

For these other methods, the potency is calculated with respect to a suitable reference preparation calibrated in mouse LD50 units.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

The test may be repeated but when more than 1 test is performed, the results of all valid tests must be combined in the estimate of potency.

LABELLING

The label states:

- the number of units of toxin per vial with a statement that units are product specific and not applicable to other preparations containing botulinum toxin type A,
- the name and the volume of the diluent to be added for reconstitution of a dried product.

DEFINITION

Bromazepam contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 7-bromo-5-(pyridin-2-yl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish, crystalline powder, practically insoluble in water, sparingly soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A, C, D, E.

- A. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 233 nm and a shoulder at about 260 nm and may show a broad absorption maximum at about 325 nm. The specific absorbance at the maximum at 233 nm is 980 to 1080.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bromazepam CRS*. Examine the substances prepared as discs.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *bromazepam CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *bromazepam CRS* and 10 mg of *temazepam CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 30 volumes of *diethylamine R* and 70 volumes of *ether R*. Dry the plate in a current of air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

- D. Dissolve about 20 mg in 5 ml of *methanol R*. Add 5 ml of *water R* and 1 ml of a 10 g/l solution of *ferrous ammonium sulphate R*. A violet colour develops.
- E. To 0.15 g in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue in 10 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of bromides (2.3.1).

01/2005:0879

BROMAZEPAM

Bromazepamum

C₁₄H₁₀BrN₃OM_r 316.2

TESTS

Appearance of solution. Dissolve 0.5 g in a mixture of 1 volume of *methanol R* and 4 volumes of *tetrahydrofuran R* and dilute to 20 ml with the same mixture of solvents. The solution is clear (2.2.1).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance. Prepare the solutions immediately before use and carry out the test protected from light.

Test solution. Dissolve 50 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Reference solution. Dilute 1 ml of the test solution to 20 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*. Dilute 2 ml of the solution to 50 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 7.5 cm using a mixture of 5 volumes of *alcohol R*, 5 volumes of *triethylamine R*, 20 volumes of *methylene chloride R* and 70 volumes of *light petroleum R1*. Dry the plate in a current of air for 20 min and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.2 per cent).

Loss on drying (2.2.32). Not more than 0.2 per cent, determined on 1.000 g by drying at 80 °C at a pressure not exceeding 2.7 kPa for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 20 ml of *anhydrous acetic acid R*. Add 50 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M *perchloric acid* is equivalent to 31.62 mg of C₁₄H₁₀BrN₃O.

STORAGE

Store protected from light.

IMPURITIES

- A. R = H: (2-amino-5-bromophenyl)(pyridin-2-yl)methanone,
 B. R = CO-CH₂-Cl: *N*-[4-bromo-2-(pyridin-2-yl)carbonyl]phenyl]-2-chloroacetamide,

- C. 7-bromo-5-(6-methylpyridin-2-yl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one,

- D. 3-amino-6-bromo-4-(pyridin-2-yl)quinolin-2(1H)-one.

01/2005:0706

BROMHEXINE HYDROCHLORIDE

Bromhexini hydrochloridum

C₁₄H₂₁Br₂ClN₂

M_r 412.6

DEFINITION

N-(2-Amino-3,5-dibromobenzyl)-*N*-methylcyclohexanamine hydrochloride.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, slightly soluble in alcohol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *bromhexine hydrochloride CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *bromhexine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel *F₂₅₄* plate *R*.

Mobile phase: glacial acetic acid *R*, water *R*, butanol *R* (17:17:66 V/V/V).

Application: 20 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- C. Dissolve about 25 mg in a mixture of 1 ml of *dilute sulphuric acid R* and 50 ml of *water R*. Add 2 ml of *methylene chloride R* and 5 ml of *chloramine solution R* and shake. A brownish-yellow colour develops in the lower layer.
- D. Dissolve about 1 mg in 3 ml of *0.1 M hydrochloric acid*. The solution gives the reaction of primary aromatic amines (2.3.1).
- E. Dissolve about 20 mg in 1 ml of *methanol R* and add 1 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Dissolve 0.6 g in *methanol R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *bromhexine impurity C CRS* in *methanol R*, add 1.0 ml of the test solution and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

Column:

- size: $l = 0.12$ m, $\varnothing = 4.6$ mm,
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (3 μ m).

Mobile phase: mix 0.50 ml of *phosphoric acid R* in 950 ml of *water R*, adjust to pH 7.0 with *triethylamine R* (about 1.5 ml) and dilute to 1000 ml with *water R*; mix 20 volumes of this solution with 80 volumes of *acetonitrile R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 248 nm.

Injection: 10 μ l.

Run time: 2.5 times the retention time of bromhexine.

Relative retention with reference to bromhexine (retention time = about 11 min): impurity A = about 0.1; impurity B = about 0.2; impurity C = about 0.4; impurity D = about 0.5.

System suitability: reference solution (a):

- resolution: minimum 12.0 between the peaks due to impurity C and bromhexine.

Limits:

- any impurity: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), and not more than 1 such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- total: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- disregard limit: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 70 ml of *alcohol R* and add 1 ml of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using *0.1 M sodium hydroxide*. Read the volume between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 41.26 mg of C₁₄H₂₁Br₂ClN₂.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

Other detectable impurities: E.

A. R = CH₂OH: (2-amino-3,5-dibromophenyl)methanol,

B. R = CHO: 2-amino-3,5-dibromobenzaldehyde,

C. R = H: *N*-(2-aminobenzyl)-*N*-methylcyclohexanamine,

D. R = Br: *N*-(2-amino-5-bromobenzyl)-*N*-methylcyclohexanamine,

and enantiomer

E. (3*RS*)-6,8-dibromo-3-cyclohexyl-3-methyl-1,2,3,4-tetrahydroquinazolin-3-ium.

01/2005:0596

BROMOCRIPTINE MESILATE

Bromocriptini mesilas

C₃₃H₄₄BrN₅O₈S

*M*_r 751

DEFINITION

Bromocriptine mesilate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (6*aR*,9*R*)-5-bromo-*N*[(2*R*,5*S*,10*aS*,10*bS*)-10*b*-hydroxy-

2-(1-methylethyl)-5-(2-methylpropyl)-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxamide monomethanesulphonate, calculated with reference to the dried substance.

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

CHARACTERS

A white or slightly coloured, fine crystalline powder, very sensitive to light, practically insoluble in water, freely soluble in methanol, soluble in alcohol, sparingly soluble in methylene chloride.

The identification, tests and assay are to be carried out as rapidly as possible, protected from light.

IDENTIFICATION

First identification: B.

Second identification: A, C, D, E.

A. Dissolve 10.0 mg in 10 ml of *methanol R* and dilute to 200.0 ml with 0.01 *M* hydrochloric acid. Examined between 250 nm and 380 nm (2.2.25), the solution shows an absorption maximum at 305 nm and a minimum at 270 nm. The specific absorbance at the maximum is 120 to 135, calculated with reference to the dried substance.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bromocriptine mesilate CRS*.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*. Prepare the solutions immediately before use.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 3 volumes of *alcohol R*, 3 volumes of *methanol R* and 4 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *bromocriptine mesilate CRS* in a mixture of 3 volumes of *alcohol R*, 3 volumes of *methanol R* and 4 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop immediately in an unsaturated tank over a path of 15 cm using a mixture of 0.1 volumes of *concentrated ammonia R*, 1.5 volumes of *water R*, 3 volumes of *2-propanol R*, 88 volumes of *methylene chloride R* and 100 volumes of *ether R*. Dry the plate in a current of cold air for 2 min. Spray with *ammonium molybdate solution R3*. Dry the plate at 100 °C until the spots appear (about 10 min). The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. To 0.1 g add 5 ml of *dilute hydrochloric acid R* and shake for about 5 min. Filter and add 1 ml of *barium chloride solution R1*. The filtrate remains clear. To a further 0.1 g add 0.5 g of *anhydrous sodium carbonate R*, mix and ignite until a white residue is obtained. Allow to cool and dissolve the residue in 7 ml of *water R* (solution A). Solution A gives reaction (a) of sulphates (2.3.1).

E. Solution A obtained in identification test D gives reaction (a) of bromides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.25 g in *methanol R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₅, BY₅ or Y₅ (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.2 g in a mixture of 2 volumes of *methanol R* and 8 volumes of *carbon dioxide-free water R* and dilute to 20 ml with the same mixture of solvents. The pH of the solution is 3.1 to 3.8.

Specific optical rotation (2.2.7). Dissolve 0.100 g in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10.0 ml with the same mixture of solvents. The specific optical rotation is + 95 to + 105, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.500 g of the substance to be examined in 5.0 ml of *methanol R* and dilute to 10.0 ml with *buffer solution pH 2.0 R*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *buffer solution pH 2.0 R* and *methanol R*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with a mixture of equal volumes of *buffer solution pH 2.0 R* and *methanol R*.

Reference solution (c). Dissolve 5.0 mg of *bromocriptine impurity A CRS* in a mixture of equal volumes of *buffer solution pH 2.0 R* and *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (d). Dissolve 5.0 mg of *bromocriptine impurity B CRS* in a mixture of equal volumes of *buffer solution pH 2.0 R* and *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (e). Mix 0.5 ml of reference solution (c) and 0.5 ml of reference solution (d) and dilute to 10.0 ml with a mixture of equal volumes of *buffer solution pH 2.0 R* and *methanol R*.

Reference solution (f). Dilute 1.0 ml of reference solution (c) to 100.0 ml with a mixture of equal volumes of *buffer solution pH 2.0 R* and *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 2 ml/min:

Mobile phase A. A 0.791 g/l solution of *ammonium carbonate R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 30	90 → 40	10 → 60	linear gradient
30 - 45	40	60	isocratic

- as detector a spectrophotometer set at 300 nm.

Inject 20 µl of reference solution (e) and adjust the sensitivity of the system so that the heights of the 2 peaks are about 20 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to impurity A and impurity B is at least 1.1.

Inject 20 µl of all other solutions. In the chromatogram obtained with the test solution: the area of the peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with reference solution (f) (0.02 per cent) and the area of the

peak corresponding to impurity C, with a relative retention of about 1.2, is not greater than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent); the area of any peak, apart from the principal peak and the peak corresponding to impurity C, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and not more than one such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Disregard any peak, apart from the peak due to impurity A, with an area less than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32). Not more than 3.0 per cent, determined on 0.500 g by drying *in vacuo* at 80 °C for 5 h.

ASSAY

Dissolve 0.500 g in 80 ml of a mixture of 10 volumes of *anhydrous acetic acid R* and 70 volumes of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 75.1 mg of $C_{33}H_{44}BrN_5O_8S$.

STORAGE

Store in an airtight container, protected from light, at a temperature not exceeding –15 °C.

IMPURITIES

- A. (6a*R*,9*R*)-5-bromo-*N*-[(2*R*,5*S*)-2-(1-methylethyl)-5-(2-methylpropyl)-3,6-dioxo-2,3,5,6,9,10-hexahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxamide (2-bromodehydro- α -ergocriptine),

- B. (6a*R*,9*R*)-*N*-[(2*R*,5*S*,10a*S*,10b*S*)-10b-hydroxy-2-(1-methylethyl)-5-(2-methylpropyl)-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxamide (α -ergocriptine),

- C. (6a*R*,9*S*)-5-bromo-*N*-[(2*R*,5*S*,10a*S*,10b*S*)-10b-hydroxy-2-(1-methylethyl)-5-(2-methylpropyl)-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxamide ((9*S*)-2-bromo- α -ergocriptine),

- D. R = OH: (6a*R*,9*R*)-5-bromo-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxylic acid,

- E. R = NH₂: (6a*R*,9*R*)-5-bromo-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxamide,

- F. (6a*R*,9*R*)-5-bromo-*N*-[(2*S*,5*S*,10a*S*,10b*S*)-10b-hydroxy-2-(1-methylethyl)-5-(2-methylpropyl)-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxamide ((2'*S*)-2-bromo- α -ergocriptine),

- G. (6a*R*,9*R*)-5-bromo-*N*-[(2*R*,5*S*,10a*S*,10b*S*)-10b-methoxy-2-(1-methylethyl)-5-(2-methylpropyl)-3,6-dioxooctahydro-8*H*-oxazolo[3,2-*a*]pyrrolo[2,1-*c*]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-*fg*]quinoline-9-carboxamide (2-bromo-10'*b*-*O*-methyl- α -ergocriptine).

01/2005:1178

BROMPERIDOL**Bromperidolum** $C_{21}H_{23}BrFNO_2$ M_r 420.3**DEFINITION**

Bromperidol contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-[4-(4-bromophenyl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, sparingly soluble in methanol and in methylene chloride, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Melting point (2.2.14): 156 °C to 159 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bromperidol CRS*. Examine the substances prepared as discs.
- C. Examine by thin layer chromatography (2.2.27), using as the coating substance a suitable octadecylsilyl silica gel.
- Test solution.* Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.
- Reference solution (a).* Dissolve 10 mg of *bromperidol CRS* in *methanol R* and dilute to 10 ml with the same solvent.
- Reference solution (b).* Dissolve 10 mg of *bromperidol CRS* and 10 mg of *haloperidol CRS* in *methanol R* and dilute to 10 ml with the same solvent.
- Apply separately to the plate 1 µl of each solution. Develop in an unsaturated tank over a path of 15 cm using a mixture of 10 volumes of *tetrahydrofuran R*, 45 volumes of *methanol R* and 45 volumes of a 58 g/l solution of *sodium chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two spots which may, however, not be completely separated.
- D. Dissolve about 10 mg in 5 ml of *ethanol R*. Add 0.5 ml of *dinitrobenzene solution R* and 0.5 ml of 2 M *alcoholic potassium hydroxide solution R*. A violet colour is produced that becomes brownish-red after 20 min.
- E. To 0.1 g in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute*

nitric acid R and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of bromides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.2 g in 20 ml of a 1 per cent V/V solution of *lactic acid R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *bromperidol CRS* and 5.0 mg of *haloperidol CRS* in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.0 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min:
Mobile phase A. A 17 g/l solution of *tetrabutylammonium hydrogen sulphate R*,
Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	90 → 50	10 → 50	linear gradient
15 - 20	50	50	isocratic elution
20 - 25	90	10	switch to initial eluent composition
25 = 0	90	10	restart gradient

- as detector a spectrophotometer set at 230 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate with the initial eluent composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: *haloperidol*, about 5.5 min and *bromperidol* about 6 min. The test is not valid unless the resolution between the peaks due to *haloperidol* and *bromperidol* is at least 3.0. If necessary, adjust the concentration of *acetonitrile* in the mobile phase or adjust the time programme for the linear gradient elution.

Inject separately 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak obtained with the blank and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 42.03 mg of $C_{31}H_{41}BrFNO_3$.

STORAGE

Store protected from light.

IMPURITIES

- A. R1 = R2 = R3 = H, R4 = F: 1-(4-(4-fluorophenyl)-4-(4-hydroxy-4-phenylpiperidin-1-yl)butan-1-one,
- B. R1 = Br, R2 = F, R3 = R4 = H: 4-[4-(4-bromophenyl)-4-hydroxypiperidin-1-yl]-1-(2-fluorophenyl)butan-1-one,
- C. R1 = C₆H₅, R2 = R3 = H, R4 = F: 4-[4-(biphenyl-4-yl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one,
- D. R1 = Br, R2 = H, R3 = C₂H₅, R4 = F: 4-[4-(4-bromophenyl)-4-hydroxypiperidin-1-yl]-1-(3-ethyl-4-fluorophenyl)butan-1-one,

- E. 4-[4-(4-bromophenyl)-4-hydroxypiperidin-1-yl]-1-[4-(4-bromophenyl)-4-hydroxypiperidin-1-yl]phenyl]butan-1-one,

- F. 4-[4-(4'-bromobiphenyl-4-yl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one.

BROMPERIDOL DECANOATE

Bromperidoli decanoas

$C_{31}H_{41}BrFNO_3$

M_r 574.6

DEFINITION

Bromperidol decanoate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 4-(4-bromophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, very soluble in methylene chloride, soluble in alcohol. It melts at about 60 °C.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bromperidol decanoate CRS*. Examine the substances prepared as mulls in *liquid paraffin R*.
- B. To 0.1 g in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of bromides (2.3.1).

TESTS

Appearance of solution. Dissolve 2.0 g in *methylene chloride R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₅ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *bromperidol decanoate CRS* and 2.5 mg of *haloperidol decanoate CRS* in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.0 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min:

Mobile phase A. A 27 g/l solution of *tetrabutylammonium hydrogen sulphate R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 30	80 → 40	20 → 60	linear gradient
30 - 35	40	60	isocratic elution
35 - 40	40 → 80	60 → 20	switch to initial eluent composition
40 = 0	80	20	restart gradient

— as detector a spectrophotometer set at 230 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate at the initial eluent composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: haloperidol decanoate about 24 min; bromperidol decanoate about 24.5 min. The test is not valid unless the resolution between the peaks due to haloperidol decanoate and bromperidol decanoate is at least 1.5. If necessary, adjust the gradient or the time programme for the linear gradient elution.

Inject separately 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks apart from the principal peak is not greater than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Disregard any peak due to the blank and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 30 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.450 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid* using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 57.46 mg of C₃₁H₄₁BrFNO₃.

STORAGE

Store at a temperature below 25 °C, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J, K.

Other detectable impurities: L.

A. R1 = R2 = R3 = H, R4 = F: 1-[4-(4-fluorophenyl)-4-oxobutyl]-4-phenylpiperidin-4-yl decanoate,

B. R1 = Br, R2 = F, R3 = R4 = H: 4-(4-bromophenyl)-1-[4-(2-fluorophenyl)-4-oxobutyl]-piperidin-4-yl decanoate,

C. R1 = Br, R2 = H, R3 = C₂H₅, R4 = F: 4-(4-bromophenyl)-1-[4-(3-ethyl-4-fluorophenyl)-4-oxobutyl]-piperidin-4-yl decanoate,

F. R1 = C₆H₅, R2 = R3 = H, R4 = F: 4-(biphenyl-4-yl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate,

D. 4-(4-bromophenyl)-1-[4-[4-[4-(4-bromophenyl)-4-hydroxypiperidin-1-yl]phenyl]-4-oxobutyl]piperidin-4-yl decanoate,

E. 4-(4'-bromobiphenyl-4-yl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate,

G. bromperidol,

H. n = 5: 4-(4-bromophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl octanoate,

I. n = 6: 4-(4-bromophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl nonanoate,

J. n = 8: 4-(4-bromophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl undecanoate,

K. n = 9: 4-(4-bromophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl dodecanoate,

L. 1-(4-fluorophenyl)ethanone.

01/2005:0977

BROMPHENIRAMINE MALEATE**Brompheniramine maleate****DEFINITION**

Brompheniramine maleate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (3*RS*)-3-(4-bromophenyl)-*N,N*-dimethyl-3-(pyridin-2-yl)propan-1-amine (*Z*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water, freely soluble in alcohol, in methanol and in methylene chloride.

IDENTIFICATION

First identification: A, B, C, D, E.

Second identification: A, B, E, F.

- A. Melting point (2.2.14): 130 °C to 135 °C.
- B. Dissolve 65 mg in 0.1 *M* hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of this solution to 100.0 ml with 0.1 *M* hydrochloric acid. Examined between 220 nm and 320 nm (2.2.25), the solution shows an absorption maximum at 265 nm. The specific absorbance at the maximum is 190 to 210.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with brompheniramine maleate CRS. Examine the substances prepared as discs using potassium bromide *R*.
- D. Examine the chromatograms obtained in the test for related substances. The retention time and size of the principal peak in the chromatogram obtained with the test solution are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (a). The chromatogram obtained with reference solution (c) shows two principal peaks with retention times corresponding to the retention times of the peaks obtained with reference solutions (a) and (b).
- E. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.10 g of the substance to be examined in methanol *R* and dilute to 5.0 ml with the same solvent.

Reference solution. Dissolve 56 mg of maleic acid *R* in methanol *R* and dilute to 10 ml with the same solvent. Apply to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of 3 volumes of water *R*, 7 volumes of anhydrous formic acid *R*, 20 volumes of methanol *R* and 70 volumes of di-isopropyl ether *R*. Allow the plate to dry in a current of air for a few minutes and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows

two clearly separated spots. The upper spot is similar in position and size to the spot in the chromatogram obtained with the reference solution.

- F. To 0.15 g in a porcelain crucible add 0.5 g of anhydrous sodium carbonate *R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue in 10 ml of dilute nitric acid *R* and filter. To 1 ml of the filtrate add 1 ml of water *R*. The solution gives reaction (a) of bromides (2.3.1).

TESTS

Appearance of solution. Dissolve 2.0 g in methanol *R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

pH (2.2.3). Dissolve 0.20 g in 20 ml of carbon dioxide-free water *R*. The pH of the solution is 4.0 to 5.0.

Optical rotation (2.2.7). Dissolve 2.5 g in water *R* and dilute to 25.0 ml with the same solvent. The angle of optical rotation measured in a 2 dm tube is −0.2° to +0.2°.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 0.10 g of the substance to be examined in 10 ml of methylene chloride *R*.

Reference solution (a). Dissolve 10 mg of brompheniramine maleate CRS in methylene chloride *R* and dilute to 1 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of chlorphenamine maleate CRS in methylene chloride *R* and dilute to 1 ml with the same solvent.

Reference solution (c). To 0.5 ml of the test solution add 0.5 ml of reference solution (b).

The chromatographic procedure may be carried out using:

- a glass column 2.3 m long and 2 mm in internal diameter packed with acid- and base-washed silanised diatomaceous earth for gas chromatography *R* (135–175 µm) impregnated with 3 per cent *m/m* of polymethylphenylsiloxane *R*,
- nitrogen for chromatography *R* as the carrier gas at a flow rate of 20 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 205 °C and that of the injection port and of the detector at 250 °C.

Inject 1 µl of each solution. The test is not valid unless, in the chromatogram obtained with reference solution (c), the resolution between the peaks corresponding to brompheniramine and chlorphenamine is at least 1.5. After injecting the test solution, continue the chromatography for at least 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the sum of the areas of the peaks, apart from the principal peak, is not greater than 1 per cent of the area of the principal peak; none of the peaks, apart from the principal peak, has an area greater than 0.4 per cent of the area of the principal peak. Disregard any peak with an area less than 0.1 per cent of that of the peak corresponding to brompheniramine in the chromatogram obtained with the test solution.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.260 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 21.77 mg of $C_{20}H_{23}BrN_2O_4$.

STORAGE

Store protected from light.

IMPURITIES

- A. chlorphenamine,
B. dexchlorpheniramine,

- C. (3*R*)-*N,N*-dimethyl-3-phenyl-3-(pyridin-2-yl)propan-1-amine (pheniramine).

01/2005:1075

BUDESONIDE

Budesonidum

 $C_{25}H_{34}O_6$ M_r 430.5

DEFINITION

Budesonide contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of a mixture of the C-22*S* (epimer A) and the C-22*R* (epimer B) epimers of 16 α ,17-[(1*R**S*)-butylidenebis(oxy)]-11 β ,21-dihydroxypregna-1,4-diene-3,20-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *budesonide CRS*. Examine the substances prepared as discs.
- B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 25 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 25 mg *budesonide CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 12.5 mg *triamcinolone acetone CRS* in reference solution (a) and dilute to 5 ml with the same solution.

Apply separately to the plate 5 μ l of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Dissolve about 2 mg in 2 ml of *sulphuric acid R*. Within 5 min, a yellow colour develops. Within 30 min, the colour changes to brown or reddish-brown. Add cautiously the solution to 10 ml of *water R* and mix. The colour fades and a clear solution remains.

- D. Dissolve about 1 mg in 2 ml of a solution containing 2 g of *phosphomolybdic acid R* dissolved in a mixture of 10 ml of *dilute sodium hydroxide solution R*, 15 ml of *water R* and 25 ml of *glacial acetic acid R*. Heat for 5 min on a water-bath. Cool in iced water for 10 min and add 3 ml of *dilute sodium hydroxide solution R*. The solution is blue.

TESTS

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 20 μ l of reference solution (a). Adjust the sensitivity of the system so that the height of the peak corresponding to epimer B (the first of the two principal peaks) in the chromatogram obtained is not less than 50 per cent of the full scale of the recorder. Inject 20 μ l of the test solution, 20 μ l of reference solution (a) and 20 μ l of reference solution (b). Continue the chromatography for 1.5 times the retention time of epimer B. In the chromatogram obtained with the test solution: the area of any peak, apart from the peaks corresponding to epimer A and epimer B, is not greater than the sum of the areas of the epimer peaks in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of any such peaks is not greater than the sum of the areas of the epimer peaks in the chromatogram obtained with reference solution (a) (1.5 per cent). Disregard any peak with an area less than 0.1 times the sum of the areas of the epimer peaks in the chromatogram obtained with reference solution (b).

Epimer A. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 20 µl of the test solution. The content of epimer A (second peak) is 40.0 per cent to 51.0 per cent of the sum of the areas of the two epimer peaks of budesonide.

Methanol. Not more than 0.1 per cent, determined by head-space gas chromatography using the standard addition method (2.2.28).

Test solution. Dissolve 2.000 g of the substance to be examined in *dimethylacetamide R* and dilute to 20.0 ml with the same solvent.

Reference solution. Dilute 0.500 g of *methanol R* in *dimethylacetamide R* and dilute to 100.0 ml with the same solvent.

The following head-space conditions may be used:

- equilibration temperature: 80 °C,
- equilibration time: 30 min,
- transfer-line temperature: 85 °C,
- pressurisation time: 10 s,
- injection time: 10 s.

The chromatographic procedure may be carried out using:

- a fused-silica capillary column 30 m long and 0.32 mm in internal diameter coated with *macrogol 20 000 R* (film thickness 1 µm),
- *nitrogen for chromatography R* as the carrier gas at a pressure of 55 kPa,
- a flame-ionisation detector,

maintaining the temperature of the column at 50 °C for 5 min, then raising the temperature at a rate of 30 °C per minute to 220 °C and maintaining at 220 °C for 2 min, and maintaining the temperature of the injection port at 250 °C and that of the detector at 300 °C.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Examine by liquid chromatography (2.2.29). *Protect the solutions from light throughout the assay.*

Test solution. Dissolve 25.0 mg of the substance to be examined in 15 ml of *acetonitrile R* and dilute to 50.0 ml with *phosphate buffer solution pH 3.2 R*. Allow to stand for at least 15 min before use.

Reference solution (a). Dilute 15.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 25.0 mg of *budesonide CRS* in 15 ml of *acetonitrile R* and dilute to 50.0 ml with *phosphate buffer solution pH 3.2 R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 32 volumes of *acetonitrile R* and 68 volumes of *phosphate buffer solution pH 3.2 R*,
- as detector a spectrophotometer set at 240 nm.

Inject 20 µl of reference solution (c). Adjust the sensitivity of the system so that the height of the peak corresponding to epimer B (the first of the two principal peaks) in the

chromatogram obtained is not less than 50 per cent of the full scale of the recorder. When the chromatograms are recorded in the prescribed conditions, the retention time for epimer B is about 16 min. If necessary, adjust the concentration of acetonitrile in the mobile phase (increasing the concentration to decrease the retention time). The test is not valid unless: in the chromatogram obtained with reference solution (c), the resolution between the peaks corresponding to epimer A and epimer B is not less than 1.5; the number of theoretical plates determined from the epimer B peak is at least 4000; the symmetry factor for the same peak is less than 1.5.

Inject 20 µl of reference solution (c) six times. The assay is not valid unless the relative standard deviation of the sum of the peak areas of the two epimers is at most 1.0 per cent. Inject alternatively the test solution and reference solution (c).

Calculate the percentage content of $C_{25}H_{34}O_6$ from the sum of the areas of the two epimer peaks.

IMPURITIES

A. 11β,16α,17,21-tetrahydroxypregna-1,4-diene-3,20-dione,

B. R = CH₃, R' = H: 16α,17-[(1RS)-ethylidenebis(oxy)]-11β,21-dihydroxypregna-1,4-diene-3,20-dione,

F. R = R' = CH₃: 16α,17-[1-methylethylidenebis(oxy)]-11β,21-dihydroxypregna-1,4-diene-3,20-dione,

C. 16α,17-[(1RS)-butylidenebis(oxy)]-11β-hydroxy-17-(hydroxymethyl)-D-homoandrosta-1,4-diene-3,17a-dione,

D. 16α,17-[(1RS)-butylidenebis(oxy)]-11β-hydroxy-3,20-dioxopregna-1,4-dien-21-al,

E. 16α,17-[(1*RS*)-butylidenebis(oxy)]-11β,21-dihydroxypregna-1,4,14-triene-3,20-dione,

G. 16α,17-[(1*RS*)-butylidenebis(oxy)]-11β,21-dihydroxypregna-4-ene-3,20-dione.

01/2005:1179

BUFEXAMAC

Bufexamacum

C₁₂H₁₇NO₃

*M*_r 223.3

DEFINITION

Bufexamac contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 2-(4-butoxyphenyl)-*N*-hydroxyacetamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, soluble in dimethylformamide, slightly soluble in ethyl acetate and in methanol.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- Dissolve 20 mg in *methanol R* and dilute to 20 ml with the same solvent. Dilute 1 ml of the solution to 50 ml with *methanol R*. Examined between 210 nm and 360 nm (2.2.25), the solution shows three absorption maxima, at 228 nm, 277 nm and 284 nm.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *bufexamac CRS*. Examine the substances prepared as discs.
- Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *bufexamac CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *salicylic acid R* in reference solution (a) and dilute to 5 ml with the same solution.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 4 volumes of *glacial acetic acid R*, 20 volumes of *dioxan R* and 90 volumes of *toluene R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of the test solution to 25.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *bufexamac CRS* and 5 mg of *salicylic acid R* in the mobile phase and dilute to 10 ml with the mobile phase. Dilute 1 ml of the solution to 10 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm) having a specific surface area of 350 m²/g and a pore size of 10 nm,
- as mobile phase at a flow rate of 1 ml/min a mixture of 30 volumes of a 1.4 g/l solution of *dipotassium hydrogen phosphate R* and 70 volumes of *methanol R* adjusted to pH 3.6 with *dilute phosphoric acid R*,
- as detector a spectrophotometer set at 275 nm.

Inject 20 µl of reference solution (a) and 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (a) is at least 50 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained with reference solution (b) the resolution between the peaks corresponding to salicylic acid and to bufexamac is at least 2.0.

Inject 20 µl of the test solution. Continue the chromatography for four times the retention time of bufexamac. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (a).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *dimethylformamide R*. Titrate with 0.1 *M lithium methoxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M lithium methoxide is equivalent to 22.33 mg of $C_{12}H_{17}NO_3$.

STORAGE

Store protected from light.

IMPURITIES

- A. R = OH: 2-(4-butoxyphenyl)acetic acid,
 B. R = OCH₃: methyl 2-(4-butoxyphenyl)acetate,
 C. R = OC₄H₉: butyl 2-(4-butoxyphenyl)acetate,
 D. R = NH₂: 2-(4-butoxyphenyl)acetamide.

01/2005:1398

BUFLOMEDIL HYDROCHLORIDE

Buflomedili hydrochloridum

$C_{17}H_{26}ClNO_4$

M_r 343.9

DEFINITION

4-(Pyrrolidin-1-yl)-1-(2,4,6-trimethoxyphenyl)butan-1-one hydrochloride.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, microcrystalline powder.

Solubility: freely soluble in water, soluble in alcohol, very slightly soluble in acetone.

mp: about 195 °C, with decomposition.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 25.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml to 20.0 ml with *alcohol R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 275 nm. The specific absorbance at the maximum is 143 to 149.

- B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: buflomedil hydrochloride CRS.

- C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 40 mg of the substance to be examined in *methanol R* and dilute to 2 ml with the same solvent.

Reference solution. Dissolve 40 mg of buflomedil hydrochloride CRS in *methanol R* and dilute to 2 ml with the same solvent.

Plate: TLC silica gel F₂₅₄ plate R.

Mobile phase: triethylamine R, 2-propanol R, toluene R (5:50:50 V/V/V).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in carbon dioxide-free water R and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3): 5.0 to 6.5 for solution S.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 0.5 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 2 mg of buflomedil impurity B CRS in the mobile phase. Add 0.5 ml of the test solution and dilute to 100 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm),
- temperature: 40 °C.

Mobile phase: mix 45 volumes of acetonitrile R and 55 volumes of a 9.25 g/l solution of potassium dihydrogen phosphate R adjusted to pH 2.5 with phosphoric acid R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 µl.

Run time: twice the retention time of buflomedil.

Retention time: buflomedil = about 5 min.

System suitability: reference solution (b):

- resolution: minimum 5.0 between the peaks due to buflomedil and impurity B.

Limits:

- any impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent),
- total: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- disregard limit: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 15 ml of anhydrous acetic acid R and add 35 ml of acetic anhydride R. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 34.39 mg of $C_{17}H_{26}ClNO_4$.

IMPURITIES

- A. $R_1 = OH$, $R_2 = OCH_3$: 4-(pyrrolidin-1-yl)-1-(2-hydroxy-4,6-dimethoxyphenyl)butan-1-one,
 B. $R_1 = OCH_3$, $R_2 = OH$: 4-(pyrrolidin-1-yl)-1-(4-hydroxy-2,6-dimethoxyphenyl)butan-1-one,
 C. $R_1 = R_2 = OH$: 4-(pyrrolidin-1-yl)-1-(2,4-dihydroxy-6-methoxyphenyl)butan-1-one.

01/2005:1076

BUMETANIDE

Bumetanidum

$C_{17}H_{20}N_2O_5S$

M_r 364.4

DEFINITION

3-(Butylamino)-4-phenoxy-5-sulphamoylbenzoic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: practically insoluble in water, soluble in acetone and in alcohol, slightly soluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

It shows polymorphism.

mp: about 233 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: bumetanide CRS.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in acetone R, evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, Method II).

Dissolve 0.1 g in a 6 g/l solution of potassium hydroxide R and dilute to 20 ml with the same solution.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 2 mg of bumetanide impurity A CRS and 2 mg of bumetanide impurity B CRS in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: end-capped octylsilyl silica gel for chromatography R (3.5 μ m).

Mobile phase: mix 70 volumes of methanol R, 25 volumes of water for chromatography R and 5 volumes of a 27.2 g/l solution of potassium dihydrogen phosphate R previously adjusted to pH 7.0 with a 280 g/l solution of potassium hydroxide R; add tetrahexylammonium bromide R to this mixture to obtain a concentration of 2.17 g/l.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 μ l.

Run time: 5 times the retention time of bumetanide.

Relative retention with reference to bumetanide (retention time = about 6 min): impurity B = about 0.4; impurity A = about 0.6; impurity D = about 2.5; impurity C = about 4.4.

System suitability: reference solution (b):

- resolution: minimum 2.0 between the peaks due to impurity A and impurity B.

Limits:

- impurities A, B, C, D: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- other impurities: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- total: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- disregard limit: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of alcohol R. Add 0.1 ml of phenol red solution R. Titrate with 0.1 M sodium hydroxide until a violet-red colour is obtained. Carry out a blank titration.

1 ml of 0.1 M sodium hydroxide is equivalent to 36.44 mg of $C_{17}H_{20}N_2O_5S$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

- A. R1 = H, R2 = NO₂: 3-nitro-4-phenoxy-5-sulphamoylbenzoic acid,
 B. R1 = H, R2 = NH₂: 3-amino-4-phenoxy-5-sulphamoylbenzoic acid,
 C. R1 = C₄H₉, R2 = NH-C₄H₉: butyl 3-(butylamino)-4-phenoxy-5-sulphamoylbenzoate,

- D. 3-[[[(2RS)-2-ethylhexyl]amino]-4-phenoxy-5-sulphamoylbenzoic acid.

01/2005:0541

BUPIVACAINE HYDROCHLORIDE

Bupivacaini hydrochloridum

C₁₈H₂₉ClN₂O₂M_r 342.9

DEFINITION

(2RS)-1-Butyl-N-(2,6-dimethylphenyl)piperidine-2-carboxamide hydrochloride monohydrate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.

Solubility: soluble in water, freely soluble in alcohol.

mp: about 254 °C, with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs of potassium bromide R.

Comparison: bupivacaine hydrochloride CRS.

- B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in methanol R and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 25 mg of bupivacaine hydrochloride CRS in methanol R and dilute to 5 ml with the same solvent.

Plate: TLC silica gel G plate R.

Mobile phase: concentrated ammonia R, methanol R (0.1:100 V/V).

Application: 5 µl.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with dilute potassium iodobismuthate solution R.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- C. Dissolve 0.1 g in 10 ml of water R, add 2 ml of dilute sodium hydroxide solution R and shake with 2 quantities, each of 15 ml, of ether R. Dry the combined ether layers over anhydrous sodium sulphate R and filter. Evaporate the ether, recrystallise the residue from alcohol (90 per cent V/V) R and dry under reduced pressure. The crystals melt (2.2.14) at 105 °C to 108 °C.

- D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in carbon dioxide-free water R and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S add 0.2 ml of 0.01 M sodium hydroxide; the pH (2.2.3) is not less than 4.7. Add 0.4 ml of 0.01 M hydrochloric acid; the pH is not greater than 4.7.

Related substances. Gas chromatography (2.2.28).

Internal standard solution. Dissolve 25 mg of methyl behenate R in methylene chloride R and dilute to 500 ml with the same solvent.

Test solution. Dissolve 50.0 mg of the substance to be examined in 2.5 ml of water R, add 2.5 ml of dilute sodium hydroxide solution R and extract with 2 quantities, each of 5 ml, of the internal standard solution. Filter the lower layer.

Reference solution (a). Dissolve 10 mg of the substance to be examined, 10 mg of bupivacaine impurity B CRS and 10 mg of bupivacaine impurity E CRS in 2.5 ml of water R, add 2.5 ml of dilute sodium hydroxide solution R and extract with 2 quantities, each of 5 ml, of the internal standard solution. Filter the lower layer and dilute to 20 ml with the internal standard solution.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the internal standard solution.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 10.0 ml with the internal standard solution.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with the internal standard solution.

Column:

- material: fused silica,
- size: l = 30 m, Ø = 0.32 mm,
- stationary phase: poly(dimethyl)(diphenyl)siloxane R (film thickness 0.25 µm).

Carrier gas: helium for chromatography R.

Flow rate: 2.5 ml/min.

Split ratio: 1:12.

Temperature:

	Time (min)	Temperature (°C)
	0	180
Column	0 - 10	180 → 230
	10 - 15	230
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to bupivacaine (retention time = about 10 min): impurity C = about 0.5; impurity A = about 0.6; impurity B = about 0.7; impurity D = about 0.8; impurity E = about 1.1; internal standard = about 1.4.

System suitability: reference solution (a):

- resolution: minimum 3.0 between the peaks due to bupivacaine and impurity E.

Limits:

- impurity B: calculate the ratio (*R*) of the area of the principal peak to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (c); from the chromatogram obtained with the test solution, calculate the ratio of the area of the peak due to impurity B to the area of the peak due to the internal standard: this ratio is not greater than *R* (0.5 per cent),
- any other impurity: calculate the ratio (*R*) of the area of the principal peak to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (d); from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak, apart from the principal peak, the peak due to impurity B and the peak due to the internal standard, to the area of the peak due to the internal standard: this ratio is not greater than *R* (0.1 per cent),
- total: calculate the ratio (*R*) of the area of the principal peak to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: this ratio is not greater than *R* (1.0 per cent),
- disregard limit: ratio less than 0.01 times *R* (0.01 per cent).

2,6-Dimethylaniline: maximum 100 ppm.

Dissolve 0.50 g in *methanol R* and dilute to 10 ml with the same solvent. To 2 ml of the solution add 1 ml of a freshly prepared 10 g/l solution of *dimethylaminobenzaldehyde R* in *methanol R* and 2 ml of *glacial acetic acid R* and allow to stand for 10 min. Any yellow colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 2 ml of a 5 mg/l solution of *2,6-dimethylaniline R* in *methanol R*.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit

test B. Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *methanol R*.

Loss on drying (2.2.32): 4.5 per cent to 6.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 20 ml of *water R* and 25 ml of *alcohol R*. Add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *ethanolic sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 32.49 mg of C₁₈H₂₉ClN₂O.

STORAGE

Protected from light.

IMPURITIES

A. *N*-(2,6-dimethylphenyl)pyridine-2-carboxamide,

B. (2*RS*)-*N*-(2,6-dimethylphenyl)piperidine-2-carboxamide,

C. 1-(2,6-dimethylphenyl)-1,5,6,7-tetrahydro-2*H*-azepin-2-one,

D. R1 = R2 = Cl: (2*RS*)-2,6-dichloro-*N*-(2,6-dimethylphenyl)hexanamide,

E. R1 = H, R2 = NH-(CH₂)₃-CH₃: 6-(butylamino)-*N*-(2,6-dimethylphenyl)hexanamide,

F. 2,6-dimethylaniline.

01/2005:1180 — as detector a spectrophotometer set at 288 nm, maintaining the temperature of the column at 40 °C.

BUPRENORPHINE

Buprenorphinum

$C_{29}H_{41}NO_4$

M_r 467.6

DEFINITION

Buprenorphine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2S)-2-[17-(cyclopropylmethyl)-4,5 α -epoxy-3-hydroxy-6-methoxy-6 α ,14-ethano-14 α -morphinan-7 α -yl]-3,3-dimethylbutan-2-ol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, freely soluble in acetone, soluble in methanol, slightly soluble in cyclohexane. It dissolves in dilute solutions of acids.

It melts at about 217 °C.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of buprenorphine*.

TESTS

Solution S. Dissolve 0.250 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7): – 103 to – 107, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of the substance to be examined in 2.0 ml of *methanol R*. Add 0.25 ml of 2 M *hydrochloric acid*.

Reference solution (b). Dilute 0.5 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (c). Dilute 0.65 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 4.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of about 1 ml/min, a mixture of 10 volumes of a 10 g/l solution of *ammonium acetate R* and 60 volumes of *methanol R*,

as detector a spectrophotometer set at 288 nm, maintaining the temperature of the column at 40 °C. Inject 20 μ l of reference solution (a). Adjust the flow rate so that the retention time of the peak corresponding to buprenorphine is about 15 min. The test is not valid unless the chromatogram obtained with reference solution (a) presents 2 peaks, the first having a retention time of 0.93 relative to the second peak (buprenorphine). Inject 20 μ l of each solution. Record the chromatogram of the test solution for 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of such peaks is not greater than the area of the peak in the chromatogram obtained with reference solution (c) (0.65 per cent). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (d).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve 0.400 g in 40 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* until the colour changes from violet-blue to green, using 0.1 ml of *crystal violet solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 46.76 mg of $C_{29}H_{41}NO_4$.

STORAGE

Store protected from light.

IMPURITIES

- R1 = H, R2 = $CH_2CH_2CH=CH_2$: (2S)-2-[17-(but-3-enyl)-4,5 α -epoxy-3-hydroxy-6-methoxy-6 α ,14-ethano-14 α -morphinan-7 α -yl]-3,3-dimethylbutan-2-ol,
- R1 = R2 = H: (2S)-2-(4,5 α -epoxy-3-hydroxy-6-methoxy-6 α ,14-ethano-14 α -morphinan-7 α -yl)-3,3-dimethylbutan-2-ol,
- R1 = CH_3 , R2 = CN: 4,5 α -epoxy-7 α -(1S)-1-hydroxy-1,2,2-trimethylpropyl]-3,6-dimethoxy-6 α ,14-ethano-14 α -morphinan-17-carbonitrile,

- R1 = R2 = CH_3 : (2S)-2-[17-(cyclopropylmethyl)-4,5 α -epoxy-3,6-dimethoxy-6 α ,14-ethano-14 α -morphinan-7 α -yl]-3,3-dimethylbutan-2-ol (3-O-methylbuprenorphine),
- R1 = R2 = H: (2S)-2-[17-(cyclopropylmethyl)-4,5 α -epoxy-3,6-dihydroxy-6 α ,14-ethano-14 α -morphinan-7 α -yl]-3,3-dimethylbutan-2-ol (6-O-desmethylbuprenorphine).

01/2005:1181

BUPRENORPHINE HYDROCHLORIDE

Buprenorphini hydrochloridum

 $C_{29}H_{42}ClNO_4$ M_r 504.1

DEFINITION

Buprenorphine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2S)-2-[17-(cyclopropylmethyl)-4,5 α -epoxy-3-hydroxy-6-methoxy-6 α ,14-ethano-14 α -morphinan-7 α -yl]-3,3-dimethylbutan-2-ol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water, freely soluble in methanol, soluble in alcohol, practically insoluble in cyclohexane.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of buprenorphine hydrochloride*.
- 3 ml of solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.250 g in 5.0 ml of *methanol R* and while stirring dilute to 25.0 ml with *carbon dioxide-free water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10.0 ml of solution S add 0.05 ml of *methyl red solution R*. Not more than 0.2 ml of 0.02 M *sodium hydroxide* or 0.02 M *hydrochloric acid* is required to change the colour of the indicator.

Specific optical rotation (2.2.7). Dissolve 0.100 g in *methanol R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is -92 to -98 , calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of the substance to be examined in 2.0 ml of *methanol R*. Add 0.25 ml of 2 M *hydrochloric acid*.

Reference solution (b). Dilute 0.5 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (c). Dilute 0.65 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 4.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as the mobile phase at a flow rate of about 1 ml/min, a mixture of 10 volumes of a 10 g/l solution of *ammonium acetate R* and 60 volumes of *methanol R*,
- as detector a spectrophotometer set at 288 nm, maintaining the temperature of the column at 40 $^{\circ}$ C.

Inject 20 μ l of reference solution (a). Adjust the flow rate so that the retention time of the peak corresponding to buprenorphine is about 15 min. The test is not valid unless the chromatogram obtained with reference solution (a) presents two peaks, the first having a retention time of 0.93 relative to the second peak (buprenorphine). Inject separately 20 μ l of each solution. Record the chromatogram of the test solution for 2.5 times the retention time of the main peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent) and the sum of the areas of such peaks is not greater than the area of the peak in the chromatogram obtained with reference solution (c) (0.65 per cent). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (d).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by heating in an oven at 115-120 $^{\circ}$ C.

ASSAY

Dissolve 0.400 g in 40 ml of *anhydrous acetic acid R* and add 10 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 50.41 mg of $C_{29}H_{42}ClNO_4$.

STORAGE

Store protected from light.

IMPURITIES

- $R_1 = H$, $R_2 = CH_2-CH_2-CH=CH_2$: (2S)-2-[17-(but-3-enyl)-4,5 α -epoxy-3-hydroxy-6-methoxy-6 α ,14-ethano-14 α -morphinan-7 α -yl]-3,3-dimethylbutan-2-ol,
- $R_1 = H$, $R_2 = H$: (2S)-2-(4,5 α -epoxy-3-hydroxy-6-methoxy-6 α ,14-ethano-14 α -morphinan-7 α -yl)-3,3-dimethylbutan-2-ol,
- $R_1 = CH_3$, $R_2 = CN$: 4,5 α -epoxy-7 α -(1S)-1-hydroxy-1,2,2-trimethylpropyl]-3,6-dimethoxy-6 α ,14-ethano-14 α -morphinan-17-carbonitrile.

01/2005:1077 **Related substances.** Liquid chromatography (2.2.29).**BUSERELIN**

Buserelinum

 $C_{60}H_{86}N_{16}O_{13}$ M_r 1239**DEFINITION**

5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-O-(1,1-dimethylethyl)-D-seryl-L-leucyl-L-arginyl-L-prolylethylamide.

Synthetic nonapeptide analogue of human gonadotrophin-releasing hormone GnRH with agonistic activity to gonadorelin. It is obtained by chemical synthesis and is available as an acetate.

Content: 95.0 per cent to 102.0 per cent (anhydrous, acetic acid-free substance).

CHARACTERS

Appearance: white or slightly yellowish powder, hygroscopic.

Solubility: sparingly soluble in water and in dilute acids.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (b).

B. Nuclear magnetic resonance spectrometry (2.2.33).

Preparation: 4 mg/ml solution in a mixture of 20 volumes of *deuterated acetic acid R* and 80 volumes of *deuterium oxide R*.

Results: the 1H NMR spectrum obtained is qualitatively similar to the *Ph. Eur. reference spectrum of buserelin*.

C. Amino acid analysis (2.2.56). For protein hydrolysis use Method 1 and for analysis use Method 1.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking one-sixth of the sum of the number of moles of glutamic acid, histidine, tyrosine, leucine, arginine, proline as equal to one. The values fall within the following limits: serine 1.4 to 2.0; proline 0.8 to 1.2; glutamic acid 0.9 to 1.1; leucine 0.9 to 1.1; tyrosine 0.9 to 1.1; histidine 0.9 to 1.1 and arginine 0.9 to 1.1. Not more than traces of other amino acids are present, with the exception of tryptophan.

TESTS

Appearance of solution. A 10 g/l solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Specific optical rotation (2.2.7): –49 to –58 (anhydrous, acetic acid-free substance), determined on a 10 g/l solution.

Specific absorbance (2.2.25): 49 to 56 by measuring at the absorption maximum at 278 nm (anhydrous, acetic acid-free substance).

Dissolve 10.0 mg in 100.0 ml of 0.01 M hydrochloric acid.

Test solution. Dissolve 5.0 mg of the substance to be examined in 5.0 ml of the mobile phase.

Reference solution (a). Dissolve the contents of a vial of *D-His-buserelin CRS* in the mobile phase. Dilute an appropriate volume of this solution in the mobile phase to obtain a final concentration of 1 mg/ml. Add 1.0 ml of the test solution to 1.0 ml of this solution.

Reference solution (b). Dissolve the contents of a vial of *buserelin CRS* in the mobile phase. Dilute an appropriate volume of this solution in the mobile phase to obtain a final concentration of 1.0 mg/ml.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: mix 200 ml of *acetonitrile R* and 700 ml of an 11.2 g/l solution of *phosphoric acid R* and adjust to pH 2.5 with *triethylamine R*.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 μ l of the test solution, reference solution (a) and reference solution (c).

Relative retention with reference to buserelin (retention time = about 36 min): impurity B = about 0.76; impurity C = about 0.83; impurity A = about 0.90; impurity D = about 0.94; impurity E = about 0.94.

System suitability: reference solution (a):

- resolution: minimum 1.5 between peaks due to impurity A and buserelin.

Limits:

- sum of impurities D and E: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (3 per cent),
- any other impurity: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (3 per cent),
- total: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (5 per cent),
- disregard limit: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Acetic acid (2.5.34): 3.0 per cent to 7.0 per cent.

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Water (2.5.12): maximum 4.0 per cent, determined on 80.0 mg.

Bacterial endotoxins (2.6.14): less than 55.5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: 10 μ l of the test solution and reference solution (b). Calculate the content of buserelin ($C_{60}H_{86}N_{16}O_{13}$) using the areas of the peaks of the chromatograms obtained and the stated content of $C_{60}H_{86}N_{16}O_{13}$ in *buserelin CRS*.

STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

If the substance is sterile, store in an airtight, sterile, tamper-proof container.

LABELLING

The label states:

- the mass of peptide in the container,
- where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

Specified impurities: A, B, C, D, E.

- A. X2 = D-His, X4 = L-Ser, X5 = L-Tyr: [2-D-histidine]buserelin,
 B. X2 = L-His, X4 = D-Ser, X5 = L-Tyr: [4-D-serine]buserelin,
 D. X2 = L-His, X4 = L-Ser, X5 = D-Tyr: [5-D-tyrosine]buserelin,

- C. buserelin-(3-9)-peptide,

- E. [1-(5-oxo-D-proline)]buserelin.

01/2005:0542

BUSULFAN

Busulfanum

$C_6H_{14}O_6S_2$

M_r 246.3

DEFINITION

Busulfan contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of butane-1,4-diyl di(methanesulphonate), calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, freely soluble in acetone and in acetonitrile, very slightly soluble in alcohol.

It melts at about 116 °C.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with busulfan CRS.

B. Examine by thin-layer chromatography (2.2.27), using silica gel G R as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in 2 ml of acetone R.

Reference solution. Dissolve 20 mg of busulfan CRS in 2 ml of acetone R.

Apply separately to the plate 5 µl of each solution.

Develop over a path of 15 cm using a mixture of equal volumes of acetone R and toluene R. Dry the plate in a stream of hot air and spray with anisaldehyde solution R. Heat the plate at 120 °C. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. To 0.1 g add 5 ml of 1 M sodium hydroxide. Heat until a clear solution is obtained. Allow to cool. To 2 ml of the solution add 0.1 ml of potassium permanganate solution R. The colour changes from purple through violet to blue and finally to green. Filter and add 1 ml of ammoniacal silver nitrate solution R. A precipitate is formed.

D. To 0.1 g add 0.1 g of potassium nitrate R and 0.25 g of sodium hydroxide R, mix and heat to fusion. Allow to cool and dissolve the residue in 5 ml of water R. Adjust to pH 1 to 2 using dilute hydrochloric acid R. The solution gives reaction (a) of sulphates (2.3.1).

TESTS

Appearance of solution. Dissolve 0.25 g in 20 ml of acetonitrile R, dilute to 25 ml with water R and examine immediately. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, Method II).

Acidity. Dissolve 0.20 g with heating in 50 ml of ethanol R. Add 0.1 ml of methyl red solution R. Not more than 0.05 ml of 0.1 M sodium hydroxide is required to change the colour of the indicator.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

To 0.250 g add 50 ml of water R. Shake. Boil under a reflux condenser for 30 min and, if necessary, make up to the initial volume with water R. Allow to cool. Using 0.3 ml of phenolphthalein solution R as indicator, titrate with 0.1 M sodium hydroxide until a pink colour is obtained.

1 ml of 0.1 M sodium hydroxide is equivalent to 12.32 mg of $C_6H_{14}O_6S_2$.

STORAGE

Store in an airtight container, protected from light.

01/2005:1847

BUTCHER'S BROOM

Rusci rhizoma

DEFINITION

Dried, whole or fragmented underground parts of *Ruscus aculeatus* L.

Content: minimum 1.0 per cent of total sapogenins, expressed as ruscogenins [mixture of neoruscogenin ($C_{27}H_{40}O_4$; M_r 428.6) and ruscogenin ($C_{27}H_{42}O_4$; M_r 430.6)] (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The rhizome consists of yellowish, branched, articulated, somewhat knotty pieces, cylindrical or subconical, about 5 cm to 10 cm long and about 5 mm thick. The surface is marked with thin annulations about 1 mm to 3 mm wide, separated from one another; rounded scars of the aerial stems are present on the upper surface. On the lower surface numerous roots, or their scars, occur; the roots are about 2 mm in diameter and similar in colour to the rhizome. The outer layer is easily detached, revealing a yellowish-white, very hard central cylinder.
- B. Reduce to a powder (355). The powder is yellowish. Examine under a microscope using *chloral hydrate solution R*. The powder shows groups of sclereids from the ground tissue of the rhizome, variously-shaped cells, ranging from rounded to elongated or rectangular; the walls are moderately thickened and distinctly beaded, with large, rounded to oval pits. Fragments of the endodermis composed of a single layer of irregularly-thickened cells. Groups of rounded parenchymatous cells, thickened at the corners, with small, triangular intercellular spaces; thin-walled parenchyma containing raphides of calcium oxalate. Groups of thick-walled fibres and small vessels, up to about 50 µm in diameter, the walls showing numerous small, slit-shaped pits.
- C. Thin-layer chromatography (2.2.27)

Test solution. Introduce 1.0 g of the powdered drug (355) and 50 ml of *dilute hydrochloric acid R* into a 100 ml flask with a ground-glass neck. Heat on a water-bath under a reflux condenser for 40 min. Allow to cool and extract the unfiltered mixture with 3 quantities, each of 25 ml, of *methylene chloride R*. Combine the organic solutions and dry over *anhydrous sodium sulphate R*. Filter and evaporate to dryness. Dissolve the residue in 5 ml of *methanol R*.

Reference solution. Dissolve 1 mg of *ruscogenins R* and 1 mg of *stigmaterol R* in *methanol R* and dilute to 5 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: *methanol R*, *methylene chloride R* (7:93 V/V).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *vanillin reagent R*, dry the plate in an oven at 100-105 °C for 1 min and examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Stigmaterol: a violet zone	Several zones of various colours A violet zone
Ruscogenins: a yellow zone	A violet zone A yellow zone (ruscogenins) Several zones of various colours
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 5 per cent.

Loss on drying (2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 12.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1): maximum 5.0 per cent.

ASSAY

Liquid chromatography (2.2.29).

Test solution. To 2.000 g of the powdered drug (355), add 60 ml of *ethanol R*, 15 ml of *water R* and 0.2 g of *potassium hydroxide R*. Extract under reflux on a water-bath for 4 h. Allow to cool and filter into a 100 ml volumetric flask. Rinse the extraction flask and the residue in the filter with 3 quantities, each of 10 ml, of *ethanol R* and add the rinsings to the volumetric flask. Dilute to 100.0 ml with *ethanol R*. Introduce 25.0 ml of the solution into a round-bottomed flask fitted to a rotary evaporator and evaporate to dryness. Dissolve the residue in 10 ml of *butanol R*, add 3 ml of *hydrochloric acid R1* and 8 ml of *water R*. Heat under reflux on a water-bath for 1 h. Allow to cool and transfer the liquid into a separating funnel, rinse the round-bottomed flask with 2 quantities, each of 10 ml, of *butanol R*. Add the rinsings to the separating funnel. Extract with 3 quantities, each of 20 ml, of *butanol R* saturated with *water R*. Combine the butanolic extracts and evaporate to dryness using a rotary evaporator. Dissolve the residue in 20 ml of *methanol R* and transfer to a 100 ml volumetric flask. Rinse the extraction flask with 20 ml, 20 ml and 10 ml of *methanol R* and add the rinsings to the volumetric flask. Dilute to 100 ml with *methanol R*.

Reference solution. Dissolve 5.0 mg of *ruscogenins R* in 100 ml of *methanol R*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase:

- mobile phase A: *water R*,
- mobile phase B: *acetonitrile for chromatography R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 25	40	60
25 - 27	40 → 0	60 → 100
27 - 37	0	100
37 - 39	0 → 40	100 → 60
39 - 42	40	60

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 203 nm.

Injection: 20 µl.

Retention time with reference to neoruscogenin (retention time = about 16 min): ruscogenin = about 1.2.

System suitability: reference solution:

- **resolution:** minimum 1.5 between the peaks due to neoruscogenin and ruscogenin.

Calculate the percentage content of sapogenins expressed as ruscogenins (neoruscogenin and ruscogenin) in the test solution by comparing the areas of the peaks in the chromatograms obtained with the test solution and the reference solution.

01/2005:0881

BUTYL PARAHYDROXYBENZOATE

Butylis parahydroxybenzoas

$C_{11}H_{14}O_3$

M_r 194.2

DEFINITION

Butyl 4-hydroxybenzoate.

Content: 98.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: very slightly soluble in water, freely soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 68 °C to 71 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: butyl parahydroxybenzoate CRS.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).

D. To about 10 mg in a test-tube add 1 ml of *sodium carbonate solution R*, boil for 30 s and cool (solution A). To a further 10 mg in a similar test-tube add 1 ml of *sodium carbonate solution R*; the substance partly dissolves (solution B). Add at the same time to solution A and solution B 5 ml of *aminopyrazolone solution R* and 1 ml of *potassium ferricyanide solution R* and mix. Solution B is yellow to orange-brown. Solution A is orange to red, the colour being clearly more intense than any similar colour which may be obtained with solution B.

TESTS

Solution S. Dissolve 1.0 g in *alcohol R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Acidity. To 2 ml of solution S add 3 ml of *alcohol R*, 5 ml of *carbon dioxide-free water R* and 0.1 ml of *bromocresol green solution R*. Not more than 0.1 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (b). Dissolve 10 mg of *butyl parahydroxybenzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of *propyl parahydroxybenzoate R* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Plate: suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm as the coating substance.

Mobile phase: *glacial acetic acid R*, *water R*, *methanol R* (1:30:70 V/V/V).

Application: 2 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated principal spots.

Limits:

- **any impurity:** any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

To 1.000 g add 20.0 ml of 1 M *sodium hydroxide*. Heat at about 70 °C for 1 h. Cool rapidly in an ice bath. Prepare a blank in the same manner. Carry out the titration on the solutions at room temperature. Titrate the excess sodium hydroxide with 0.5 M *sulphuric acid*, continuing the titration until the second point of inflexion and determining the end-point potentiometrically (2.2.20).

1 ml of 1 M *sodium hydroxide* is equivalent to 194.2 mg of $C_{11}H_{14}O_3$.

IMPURITIES

- A. R = H: 4-hydroxybenzoic acid,

BUTYLHYDROXYANISOLE

Butylhydroxyanisolum

 $C_{11}H_{16}O_2$ M_r 180.3**DEFINITION**

Butylhydroxyanisole is 2-(1,1-dimethylethyl)-4-methoxyphenol containing not more than 10 per cent of 3-(1,1-dimethylethyl)-4-methoxyphenol.

CHARACTERS

A white, yellowish or slightly pinkish, crystalline powder, practically insoluble in water, very soluble in methylene chloride, freely soluble in alcohol and in fatty oils. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

- A. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- B. To 0.5 ml of solution S (see Tests) add 10 ml of *aminopyrazolone solution R* and 1 ml of *potassium ferricyanide solution R*. Mix and add 10 ml of *methylene chloride R*. Shake vigorously. After separation, the organic layer is red.
- C. Dissolve about 10 mg in 2 ml of *alcohol R*. Add 1 ml of a 1 g/l solution of *testosterone propionate R* in *alcohol R* and 2 ml of *dilute sodium hydroxide solution R*. Heat in a water-bath at 80 °C for 10 min and allow to cool. A red colour develops.

TESTS

Solution S. Dissolve 2.5 g in *alcohol R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.25 g of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methylene chloride R*.

Reference solution (a). Dissolve 25 mg of *butylhydroxyanisole CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of reference solution (a) to 20 ml with *methylene chloride R*.

Reference solution (c). Dissolve 50 mg of *hydroquinone R* in 5 ml of *alcohol R* and dilute to 100 ml with *methylene chloride R*. Dilute 1 ml of this solution to 10 ml with *methylene chloride R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using *methylene chloride R*. Allow the plate to dry in air and spray with a freshly prepared mixture of 10 volumes of *potassium ferricyanide solution R*, 20 volumes of *ferric chloride solution R1* and 70 volumes of *water R*. In the chromatogram obtained with test solution (a): any violet-blue spot with an R_f value of about 0.35 (corresponding to 3-(1,1-dimethylethyl)-4-methoxyphenol) is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (10 per cent); any spot corresponding to hydroquinone is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.2 per cent); any spot, apart from the principal spot and any spots corresponding to 3-(1,1-dimethylethyl)-4-methoxyphenol and hydroquinone, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

STORAGE

Store protected from light.

IMPURITIES

- A. benzene-1,4-diol (hydroquinone).

01/2005:0581

BUTYLHYDROXYTOLUENE

Butylhydroxytoluenum

 $C_{15}H_{24}O$ M_r 220.4**DEFINITION**

Butylhydroxytoluene is 2,6-bis(1,1-dimethylethyl)-4-methylphenol.

CHARACTERS

A white or yellowish-white, crystalline powder, practically insoluble in water, very soluble in acetone, freely soluble in alcohol and in vegetable oils.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

- A. It complies with the test for the freezing-point (see Tests).
- B. Dissolve 0.500 g in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *ethanol R*. Examined between 230 nm and 300 nm (2.2.25), the solution shows an absorption maximum at 278 nm. The specific absorbance at the maximum is 80 to 90.

- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *butylhydroxytoluene CRS*.
- D. Dissolve about 10 mg in 2 ml of *alcohol R*. Add 1 ml of a 1 g/l solution of *testosterone propionate R* in *alcohol R* and 2 ml of *dilute sodium hydroxide solution R*. Heat in a water-bath at 80 °C for 10 min and allow to cool. A blue colour develops.

TESTS

Appearance of solution. Dissolve 1.0 g in *methanol R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅ or BY₅ (2.2.2, *Method II*).

Freezing-point (2.2.18): 69 °C to 70 °C.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dilute 1 ml of the test solution to 200 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using *methylene chloride R*. Dry the plate in air and spray with a freshly prepared mixture of 10 volumes of *potassium ferricyanide solution R*, 20 volumes of *ferric chloride solution R1* and 70 volumes of *water R*. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

CAFFEINE

Coffeinum

 $C_8H_{10}N_4O_2$ M_r 194.2

DEFINITION

Caffeine contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 1,3,7-trimethyl-3,7-dihydro-1*H*-purine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or silky, white crystals, sublimes readily, sparingly soluble in water, freely soluble in boiling water, slightly soluble in ethanol. It dissolves in concentrated solutions of alkali benzoates or salicylates.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E, F.

- A. Melting point (2.2.14): 234 °C to 239 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *caffeine CRS*.
- C. To 2 ml of a saturated solution add 0.05 ml of *iodinated potassium iodide solution R*. The solution remains clear. Add 0.1 ml of *dilute hydrochloric acid R*. A brown precipitate is formed. Neutralise with *dilute sodium hydroxide solution R*. The precipitate dissolves.
- D. In a glass-stoppered tube, dissolve about 10 mg in 0.25 ml of a mixture of 0.5 ml of *acetylacetone R* and 5 ml of *dilute sodium hydroxide solution R*. Heat in a water-bath at 80 °C for 7 min. Cool and add 0.5 ml of *dimethylaminobenzaldehyde solution R2*. Heat again in a water-bath at 80 °C for 7 min. Allow to cool and add 10 ml of *water R*. An intense blue colour develops.
- E. It complies with the test for loss on drying (see Tests).
- F. It gives the reaction of xanthines (2.3.1).

TESTS

Solution S. Dissolve 0.5 g with heating in 50 ml of *carbon dioxide-free water R* prepared from *distilled water R*, cool and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity. To 10 ml of solution S add 0.05 ml of *bromothymol blue solution R1*. The solution is green or yellow. Not more than 0.2 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to blue.

01/2005:0267 Related substances. Examine by thin-layer chromatography (2.2.27) using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 4 volumes of *methanol R* and 6 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with a mixture of 4 volumes of *methanol R* and 6 volumes of *methylene chloride R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 30 volumes of *acetone R*, 30 volumes of *methylene chloride R* and 40 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (500 ppm). Prepare the standard using a mixture of 7.5 ml of *sulphate standard solution (10 ppm SO₄) R* and 7.5 ml of *distilled water R*.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 1 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.170 g with heating in 5 ml of *anhydrous acetic acid R*. Allow to cool, add 10 ml of *acetic anhydride R* and 20 ml of *toluene R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 19.42 mg of $C_8H_{10}N_4O_2$.

IMPURITIES

Specified impurities: A.

Other detectable impurities: B, C.

A. theophylline,

B. *N*-[6-amino-1,3-dimethyl-2,4(1*H*,3*H*)-dioxypyrimidin-5-yl]formamide,

C. 1,3,9-trimethyl-3,9-dihydro-1*H*-purine-2,6-dione (isocaffeine).

01/2005:0268

CAFFEINE MONOHYDRATE

Coffeinum monohydricum

 $C_8H_{10}N_4O_2 \cdot H_2O$ M_r 212.2

DEFINITION

Caffeine monohydrate contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 1,3,7-trimethyl-3,7-dihydro-1*H*-purine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or silky, white crystals, sublimes readily, sparingly soluble in water, freely soluble in boiling water, slightly soluble in ethanol. It dissolves in concentrated solutions of alkali benzoates or salicylates.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E, F.

- Melting point (2.2.14): 234 °C to 239 °C, determined after drying at 100-105 °C.
- Dry the substance to be examined at 100-105 °C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *caffeine CRS*.
- To 2 ml of a saturated solution add 0.05 ml of *iodinated potassium iodide solution R*. The solution remains clear. Add 0.1 ml of *dilute hydrochloric acid R*. A brown precipitate is formed. Neutralise with *dilute sodium hydroxide solution R*. The precipitate dissolves.
- In a glass-stoppered tube, dissolve about 10 mg in 0.25 ml of a mixture of 0.5 ml of *acetylacetone R* and 5 ml of *dilute sodium hydroxide solution R*. Heat in a water-bath at 80 °C for 7 min. Cool and add 0.5 ml of *dimethylaminobenzaldehyde solution R2*. Heat again in a water-bath at 80 °C for 7 min. Allow to cool and add 10 ml of *water R*. An intense blue colour develops.
- It complies with the test for loss on drying (see Tests).
- It gives the reaction of xanthines (2.3.1).

TESTS

Solution S. Dissolve 0.5 g with heating in 50 ml of *carbon dioxide-free water R* prepared from *distilled water R*, cool and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity. To 10 ml of solution S add 0.05 ml of *bromothymol blue solution R1*. The solution is green or yellow. Not more than 0.2 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Examine by thin-layer chromatography (2.2.27) using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 4 volumes of *methanol R* and 6 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with a mixture of 4 volumes of *methanol R* and 6 volumes of *methylene chloride R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 30 volumes of *acetone R*, 30 volumes of *methylene chloride R* and 40 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (500 ppm). Prepare the standard using a mixture of 7.5 ml of *sulphate standard solution (10 ppm SO₄) R* and 7.5 ml of *distilled water R*.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). 5.0 per cent to 9.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 1 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.170 g, previously dried at 100-105 °C, with heating in 5 ml of *anhydrous acetic acid R*. Allow to cool, add 10 ml of *acetic anhydride R* and 20 ml of *toluene R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 19.42 mg of $C_8H_{10}N_4O_2$.

IMPURITIES

Specified impurities: A.

Other detectable impurities: B, C.

A. theophylline,

B. *N*-[6-amino-1,3-dimethyl-2,4(1*H*, 3*H*)-dioxypyrimidin-5-yl]formamide,

C. 1,3,9-trimethyl-3,9-dihydro-1*H*-purine-2,6-dione (isocaffeine).

01/2005:1295 Examine by liquid chromatography (2.2.29).

CALCIFEDIOL**Calcifediolum** $C_{27}H_{44}O_2 \cdot H_2O$ M_r 418.7**DEFINITION**

Calcifediol is the monohydrate of (5*Z*,7*E*)-9,10-seccholesta-5,7,10(19)-triene-3 β ,25-diol. It contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of $C_{27}H_{44}O_2$, calculated with reference to the anhydrous substance.

CHARACTERS

White or almost white crystals, practically insoluble in water, freely soluble in alcohol, soluble in fatty oils. It is sensitive to air, heat and light.

A reversible isomerisation to pre-calcifediol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of calcifediol*, prepared using 2 mg of the substance to be examined and 225 mg of *potassium bromide R*.
- B. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is similar in retention time and approximate size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Calculate the percentage content of related substances, apart from pre-calcifediol, that are eluted within twice the retention time of calcifediol from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure. The content of any individual related substance is not greater than 0.5 per cent and the sum of the related substances is not greater than 1.0 per cent. Disregard any peak below 0.1 per cent.

Water (2.5.32): 3.8 per cent to 5.0 per cent, determined on 10.0 mg by the micro determination of water.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

Test solution. Dissolve 1.0 mg of the substance to be examined without heating in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 1.0 mg of *calcifediol CRS* without heating in 10.0 ml of the mobile phase.

Reference solution (b). Dilute reference solution (a) 100 times with the mobile phase.

Reference solution (c). Heat 2 ml of reference solution (a) in a water-bath at 80 °C under a reflux condenser for 2 h and cool.

The chromatographic procedure may be carried out using:

- a column 0.15 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R1* (5 μ m),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 200 volumes of *water R* and 800 volumes of *methanol R*,
- as detector a spectrophotometer set at 265 nm,
- a loop injector.

Inject 50 μ l of reference solution (c) and record the chromatogram. Make a total of six injections. When the chromatograms are recorded in the prescribed conditions, the retention time for pre-calcifediol, relative to calcifediol, is about 1.3. The assay is not valid unless the relative standard deviation of the response for calcifediol is at most 1 per cent and the resolution between the peaks due to pre-calcifediol and calcifediol is at least 5.0; adjust the proportions of the constituents of the mobile phase, if necessary, to obtain this resolution.

Inject 50 μ l of reference solution (a) and 50 μ l of reference solution (b) and record the chromatograms. Inject 50 μ l of the test solution and record the chromatogram in the same manner, continuing the chromatography for twice the retention time of the principal peak.

STORAGE

Store under nitrogen, in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

The contents of an opened container are to be used immediately.

IMPURITIES

- A. 9 β ,10 α -cholesta-5,7-diene-3 β ,25-diol,

- B. cholesta-5,7-diene-3 β ,25-diol,

C. (6E)-9,10-secocholesta-5(10),6,8-triene-3β,25-diol,

D. (5E,7E)-9,10-secocholesta-5,7,10(19)-triene-3β,25-diol.

01/2005:0471

CALCITONIN (SALMON)**Calcitoninum salmonis** $\text{C}_{145}\text{H}_{240}\text{N}_{44}\text{O}_{48}\text{S}_2$ M_r 3432**DEFINITION**

Calcitonin (salmon) is a synthetic polypeptide having the structure determined for salmon calcitonin I. It lowers the calcium concentration in plasma of mammals by diminishing the rate of bone resorption. It is obtained by chemical synthesis and is available as an acetate. Calcitonin (salmon) contains not less than 90.0 per cent and not more than the equivalent of 105.0 per cent of the peptide $\text{C}_{145}\text{H}_{240}\text{N}_{44}\text{O}_{48}\text{S}_2$, calculated with reference to the anhydrous, acetic acid-free substance.

By convention, for the purpose of labelling calcitonin (salmon) preparations, 1 mg of calcitonin (salmon) ($\text{C}_{145}\text{H}_{240}\text{N}_{44}\text{O}_{48}\text{S}_2$) is equivalent to 6000 I.U. of biological activity.

CHARACTERS

A white or almost white powder, freely soluble in water.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *cellulose for chromatography R1* as the coating substance.

Test solution. Dissolve 4 mg of the substance to be examined in 2 ml of a mixture of 2 volumes of *acetic acid R* and 98 volumes of *water R*. Prepare immediately before use.

Reference solution. Dissolve the contents of a vial of *calcitonin (salmon) CRS* in a mixture of 2 volumes of *acetic acid R* and 98 volumes of *water R* to obtain a concentration of 2.0 mg/ml. Prepare immediately before use.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 6 volumes of *glacial acetic acid R*, 20 volumes of *pyridine R*, 24 volumes of *water R* and 30 volumes of *butanol R*. Allow the plate to dry in air for 1 h, heat at 110 °C for 10 min and spray the hot plate with *strong sodium hypochlorite solution R* diluted with *water R* immediately before use to contain 5 g/l of available chlorine. Dry in a current of cold air until a sprayed area of the plate below the line of application gives at most a very faint blue colour with a drop of *potassium iodide and starch solution R*; avoid prolonged exposure to cold air. Spray with *potassium iodide and starch solution R* until the spots are clearly visible. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the Assay. The retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with the reference solution.

TESTS

Acetic acid (2.5.34): 4.0 per cent to 15.0 per cent.

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Amino acids. Examine by means of an amino-acid analyser. Standardise the apparatus with a mixture containing equimolar amounts of ammonia, glycine and the L-form of the following amino acids:

lysine	histidine	arginine
serine	methionine	glutamic acid
isoleucine	proline	leucine
aspartic acid	alanine	tyrosine
threonine	valine	phenylalanine

together with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as *DL-norleucine R*, is used.

Test solution. Place 1.0 mg of the substance to be examined in a rigorously cleaned hard-glass tube 100 mm long and 6 mm in internal diameter. Add a suitable amount of a 50 per cent V/V solution of *hydrochloric acid R*. Immerse the tube in a freezing mixture at -5 °C, reduce the pressure to below 133 Pa and seal. Heat at 110 °C to 115 °C for 16 h. Cool, open the tube, transfer the contents to a 10 ml flask with the aid of five quantities, each of 0.2 ml, of *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure. Take up the residue in *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure; repeat these operations once. Take up the residue in a buffer solution suitable for the amino-acid

analyser used and dilute to a suitable volume with the same buffer solution. Apply a suitable volume to the amino-acid analyser.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids taking as equivalent to 1 the sum, divided by 20, of the number of moles of aspartic acid, glutamic acid, proline, glycine, valine, leucine, histidine, arginine and lysine. The values fall within the following limits: aspartic acid 1.8 to 2.2; glutamic acid 2.7 to 3.3; proline 1.7 to 2.3; glycine 2.7 to 3.3; valine 0.9 to 1.1; leucine 4.5 to 5.3; histidine 0.9 to 1.1; arginine 0.9 to 1.1; lysine 1.8 to 2.2; serine 3.2 to 4.2; threonine 4.2 to 5.2; tyrosine 0.7 to 1.1; half-cystine 1.4 to 2.1.

Related peptides. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 20 µl of the test solution. In the chromatogram obtained, the area of any peak apart from the principal peak is not greater than 3.0 per cent of the total area of the peaks. The sum of the areas of all the peaks, apart from the principal peak, is not greater than 5.0 per cent of the total area of the peaks. Disregard any peak due to the solvent and any peak with an area less than 0.1 per cent of that of the principal peak.

Water (2.5.32). Not more than 10.0 per cent, determined by the micro determination of water.

Acetic acid and water. Not more than 20 per cent, calculated by adding together the percentage contents of acetic acid and water determined by the methods described above.

Bacterial endotoxins (2.6.14): less than 1000 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Prepare a 1.0 mg/ml solution of the substance to be examined in mobile phase A.

Reference solution. Dissolve the contents of a vial of *calcitonin (salmon) CRS* in mobile phase A to obtain a concentration of 1.0 mg/ml.

Resolution solution. Dissolve the contents of a vial of *N-acetyl-cys¹calcitonin CRS* in 400 µl of mobile phase A and add 100 µl of the test solution.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Dissolve 3.26 g of *tetramethylammonium hydroxide R* in 900 ml of *water R*, adjust the pH to 2.5 with *phosphoric acid R* and mix with 100 ml of *acetonitrile for chromatography R*; filter and degas,

Mobile phase B. Dissolve 1.45 g of *tetramethylammonium hydroxide R* in 400 ml of *water R*, adjust the pH to 2.5 with *phosphoric acid R* and mix with 600 ml of *acetonitrile for chromatography R*; filter and degas,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 30	72 → 48	28 → 52	linear gradient
30 - 32	48 → 72	52 → 28	switch to initial eluent composition
32 - 55	72	28	re-equilibration

- as detector a spectrophotometer set at 220 nm, maintaining the temperature of the column at 65 °C.

Equilibrate the column with a mixture of 72 volumes of mobile phase A and 28 volumes of mobile phase B.

Inject 20 µl of the resolution solution. When the chromatogram is recorded in the prescribed conditions, the relative retention of *N-acetyl-cys¹calcitonin* is about 1.15 relative to the principal peak. The test is not valid unless the resolution between the peaks corresponding to calcitonin and *N-acetyl-cys¹calcitonin* is at least 5.0 and the symmetry factor for the *N-acetyl-cys¹calcitonin* peak is not greater than 2.5. If necessary, adjust the initial A:B ratio of the mobile phase.

Inject 20 µl of the test solution and 20 µl of the reference solution.

Calculate the content of calcitonin (salmon) (C₁₄₅H₂₄₀N₄₄O₄₈S₂) from the peak areas in the chromatograms obtained with the test solution and the reference solution and the declared content of C₁₄₅H₂₄₀N₄₄O₄₈S₂ in *calcitonin (salmon) CRS*. Proceed with tangential integration of the peak areas.

STORAGE

Store protected from light at a temperature between 2 °C and 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the calcitonin peptide content (C₁₄₅H₂₄₀N₄₄O₄₈S₂),
- where applicable, that the substance is free from bacterial endotoxins.

01/2005:0883

CALCITRIOL

Calcitriolum

C₂₇H₄₄O₃

M_r 416.6

DEFINITION

Calcitriol contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of (5Z,7E)-9,10-secocholesta-5,7,10(19)-triene-1α,3β,25-triol.

CHARACTERS

White or almost white crystals, practically insoluble in water, freely soluble in alcohol, soluble in fatty oils. It is sensitive to air, heat and light.

A reversible isomerisation to pre-calcitriol takes place in solution, depending on temperature and time. The activity is due to both compounds.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of calcitriol*.

B. Examine the chromatograms obtained in the assay.

The retention time and size of the principal peak in the chromatogram obtained with the test solution are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Calculate the percentage content of related substances, apart from pre-calcitriol, that are eluted within twice the retention time of calcitriol from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure. The content of any individual related substance is not greater than 0.5 per cent and the sum of the related substances is not greater than 1.0 per cent. Disregard any peak with an area less than 0.1 times that of the peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 1.000 mg of the substance to be examined without heating in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 1.000 mg of calcitriol CRS without heating in 10.0 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Keep 2 ml of reference solution (a) for 30 min at 80 °C.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R1* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min, a mixture of 450 volumes of a solution containing 1.0 g/l of *tris(hydroxymethyl)aminomethane R* adjusted to pH 7.0 to 7.5 with *phosphoric acid R*, and of 550 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 230 nm,
- a loop injector,

maintaining the temperature of the column at 40 °C.

Inject 50 µl of reference solution (c) and six times 50 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention time for pre-calcitriol, relative to calcitriol, is about 0.9. The assay is not valid unless the number of theoretical plates calculated for the peak due to calcitriol in the chromatogram obtained with reference solution (a) is at least 10 000, the relative standard deviation of the peak area due to calcitriol is at most 1 per cent and the resolution between the peaks due to calcitriol and pre-calcitriol is at least 3.5.

Inject 50 µl of reference solution (b) and 50 µl of the test solution. Continue the chromatography for twice the retention time of calcitriol.

Calculate the percentage content of calcitriol.

STORAGE

Store under nitrogen, in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

The contents of an opened container are to be used immediately.

IMPURITIES

A. (5*E*,7*E*)-9,10-secocholesta-5,7,10(19)-triene-1 α ,3 β ,25-triol (*trans*-calcitriol),

B. (5*Z*,7*E*)-9,10-secocholesta-5,7,10(19)-triene-1 β ,3 β ,25-triol (1 β -calcitriol),

C. (6*aR*,7*R*,9*aR*)-11-[(3*S*,5*R*)-3,5-dihydroxy-2-methylcyclohex-1-enyl]-7-[(1*R*)-5-hydroxy-1,5-dimethylhexyl]-6*a*-methyl-2-phenyl-5,6,6*a*,7,8,9,9*a*,11-octahydro-1*H*,4*aH*-cyclopenta[*f*]1,2,4-triazolo[1,2-*a*]cinnoline-1,3(2*H*)-dione (triazoline adduct of pre-calcitriol).

01/2005:1182

CALCIUM ASCORBATE

Calcii ascorbas

$C_{12}H_{14}CaO_{12} \cdot 2H_2O$

M_r 426.3

DEFINITION

Calcium ascorbate contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of calcium di[(*R*)-2-[(*S*)-1,2-dihydroxyethyl]-4-hydroxy-5-oxo-2*H*-furan-3-olate] dihydrate.

CHARACTERS

A white or slightly yellowish, crystalline powder, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of calcium ascorbate*.
- C. Dilute 1 ml of solution S (see Tests) to 10 ml with *water R*. To 2 ml of the solution add 0.2 ml of a 100 g/l solution of *ferrous sulphate R*. A deep violet colour develops.
- D. To 1 ml of solution S add 0.2 ml of *dilute nitric acid R* and 0.2 ml of *silver nitrate solution R2*. A grey precipitate is formed.
- E. The substance gives reaction (b) of calcium (2.3.1).

TESTS

Solution S. Dissolve 5.00 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*). Examine the colour of the solution immediately after preparation of the solution.

pH (2.2.3). The pH of solution S is 6.8 to 7.4.

Specific optical rotation (2.2.7): + 95 to + 97, determined using freshly prepared solution S and calculated with reference to the dried substance.

Fluorides. Not more than 10 ppm of F, determined potentiometrically (2.2.36, *Method I*) using as indicator electrode a fluoride-selective electrode and as reference electrode a silver-silver chloride electrode.

Test solution. In a 50 ml volumetric flask, dissolve 1.000 g in a 10.3 g/l solution of *hydrochloric acid R*, add 5.0 ml of *fluoride standard solution (1 ppm F) R* and dilute to 50.0 ml with a 10.3 g/l solution of *hydrochloric acid R*. To 20.0 ml of the solution add 20.0 ml of *total-ionic-strength-adjustment buffer R* and 3 ml of an 82 g/l solution of *anhydrous sodium acetate R*. Adjust to pH 5.2 with *ammonia R* and dilute to 50.0 ml with *distilled water R*.

Reference solutions. To 0.25 ml, 0.5 ml, 1.0 ml, 2.0 ml and 5.0 ml of *fluoride standard solution (10 ppm F) R* add 20.0 ml of *total-ionic-strength-adjustment buffer R* and dilute to 50.0 ml with *distilled water R*.

Carry out the measurements for each solution. Calculate the concentration of fluorides using the calibration curve, taking into account the addition of fluoride to the test solution.

Copper. Not more than 5 ppm of Cu, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 2.0 g of the substance to be examined in a 9.7 g/l solution of *nitric acid R* and dilute to 25.0 ml with the same acid solution.

Reference solutions. Prepare the reference solutions using *copper standard solution (10 ppm Cu) R*, diluting with a 9.7 g/l solution of *nitric acid R*.

Measure the absorbance at 324.8 nm using a copper hollow-cathode lamp as source of radiation and an air-acetylene flame.

Iron. Not more than 2 ppm of Fe, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 5.0 g of the substance to be examined in a 9.7 g/l solution of *nitric acid R* and dilute to 25.0 ml with the same acid solution.

Reference solutions. Prepare the reference solutions using *iron standard solution (10 ppm Fe) R*, diluting with a 9.7 g/l solution of *nitric acid R*.

Measure the absorbance at 248.3 nm using an iron hollow-cathode lamp as the radiation source and an air-acetylene flame.

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2.0 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.1 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

ASSAY

Dissolve 80.0 mg in a mixture of 10 ml of *dilute sulphuric acid R* and 80 ml of *carbon dioxide-free water R*. Add 1 ml of *starch solution R*. Titrate with 0.05 *M* iodine until a persistent violet-blue colour is obtained.

1 ml of 0.05 *M* iodine is equivalent to 10.66 mg of C₁₂H₁₄CaO₁₂·2H₂O.

STORAGE

Store in a non-metallic container, protected from light.

01/2005:0014

CALCIUM CARBONATE

Calcii carbonas

CaCO₃M_r 100.1

DEFINITION

Calcium carbonate contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of CaCO₃, calculated with reference to the dried substance.

CHARACTERS

A white powder, practically insoluble in water.

IDENTIFICATION

- A. It gives the reaction of carbonates (2.3.1).
- B. 0.2 ml of solution S (see Tests) gives the reactions of calcium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in 80 ml of *dilute acetic acid R*. When the effervescence ceases, boil the solution for 2 min, allow to cool, dilute to 100 ml with *dilute acetic acid R* and filter, if necessary, through a sintered-glass filter.

Substances insoluble in acetic acid. Wash any residue obtained during the preparation of solution S with four quantities, each of 5 ml, of hot *water R* and dry at 100-105 °C for 1 h. The residue weighs not more than 10 mg (0.2 per cent).

Chlorides (2.4.4). 3 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (330 ppm).

Sulphates (2.4.13). 1.2 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (0.25 per cent).

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (4 ppm).

Barium. To 10 ml of solution S add 10 ml of *calcium sulphate solution R*. After at least 15 min, any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S and 10 ml of *distilled water R*.

Iron (2.4.9). Dissolve 50 mg in 5 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. The solution complies with the limit test for iron (200 ppm).

Magnesium and alkali metals. Dissolve 1.0 g in 12 ml of *dilute hydrochloric acid R*. Boil the solution for about 2 min and add 20 ml of *water R*, 1 g of *ammonium chloride R* and 0.1 ml of *methyl red solution R*. Add *dilute ammonia RI* until the colour of the indicator changes and then 2 ml in excess. Heat to boiling and add 50 ml of hot *ammonium oxalate solution R*. Allow to stand for 4 h, dilute to 100 ml with *water R* and filter through a suitable filter. To 50 ml of the filtrate add 0.25 ml of *sulphuric acid R*. Evaporate to dryness on a water-bath and ignite to constant mass at 600 °C. The residue weighs not more than 7.5 mg (1.5 per cent).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.000 g by drying in an oven at 200 °C.

ASSAY

Dissolve 0.150 g in a mixture of 3 ml of *dilute hydrochloric acid R* and 20 ml of *water R*. Boil for 2 min, allow to cool and dilute to 50 ml with *water R*. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 10.01 mg of CaCO_3 .

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of freshly prepared solution S add 0.1 ml of *phenolphthalein solution R*. If the solution is red, not more than 0.2 ml of 0.01 M *hydrochloric acid* is required to discharge the colour and if the solution is colourless, not more than 0.2 ml of 0.01 M *sodium hydroxide* is required to turn it red.

Sulphates (2.4.13): maximum 300 ppm.

5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates.

Aluminium. To 10 ml of solution S add 2 ml of *ammonium chloride solution R* and 1 ml of *dilute ammonia RI* and boil the solution. No turbidity or precipitate is formed.

If intended for use in the manufacture of dialysis solutions, it complies with the following test for aluminium (2.4.17) which replaces the test prescribed above: maximum 1 ppm.

Prescribed solution. Dissolve 4 g in 100 ml of *water R* and add 10 ml of *acetate buffer solution pH 6.0 R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Barium. To 10 ml of solution S add 1 ml of *calcium sulphate solution R*. After at least 15 min, any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S and 1 ml of *distilled water R*.

Iron (2.4.9): maximum 10 ppm.

10 ml of solution S complies with the limit test for iron.

Magnesium and alkali metals: maximum 0.5 per cent.

To a mixture of 20 ml of solution S and 80 ml of *water R* add 2 g of *ammonium chloride R* and 2 ml of *dilute ammonia RI*, heat to boiling and pour into the boiling solution a hot solution of 5 g of *ammonium oxalate R* in 75 ml of *water R*. Allow to stand for 4 h, dilute to 200 ml with *water R* and filter through a suitable filter. To 100 ml of the filtrate add 0.5 ml of *sulphuric acid R*. Evaporate to dryness on a water-bath and ignite to constant mass at 600 °C. The residue weighs a maximum of 5 mg.

Heavy metals (2.4.8): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

ASSAY

Dissolve 0.280 g in 100 ml of *water R* and carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 14.70 mg of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

STORAGE

In an airtight container.

01/2005:0015

CALCIUM CHLORIDE DIHYDRATE

Calcii chloridum dihydricum

 $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$
 M_r 147.0

DEFINITION

Content: 97.0 per cent to 103.0 per cent of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$.

CHARACTERS

Appearance: white, crystalline powder, hygroscopic.

Solubility: freely soluble in water, soluble in alcohol.

IDENTIFICATION

A. Solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

B. It gives the reactions of calcium (2.3.1).

C. It complies with the limits of the assay.

01/2005:0707

CALCIUM CHLORIDE HEXAHYDRATE**Calcii chloridum hexahydricum** $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$ M_r 219.1**DEFINITION**

Calcium chloride hexahydrate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$.

CHARACTERS

A white, crystalline mass or colourless crystals, very soluble in water, freely soluble in alcohol.

It freezes at about 29 °C.

IDENTIFICATION

A. Solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

B. It gives the reactions of calcium (2.3.1).

C. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 15.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of freshly prepared solution S add 0.1 ml of *phenolphthalein solution R*. If the solution is red, not more than 0.2 ml of 0.01 M *hydrochloric acid* is required to discharge the colour and if the solution is colourless, not more than 0.2 ml of 0.01 M *sodium hydroxide* is required to turn it red.

Sulphates (2.4.13). 5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (200 ppm).

Aluminium. To 10 ml of solution S add 2 ml of *ammonium chloride solution R* and 1 ml of *dilute ammonia R1*. Heat to boiling. No turbidity or precipitate is formed.

If intended for use in the manufacture of dialysis solutions, it complies with the following test which replaces the test for aluminium prescribed above.

Dissolve 6 g in 100 ml of *water R* and add 10 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (1 ppm). Use as the reference solution a mixture of 2 ml of *aluminium standard solution* (2 ppm Al) *R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*. To prepare the blank use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Barium. To 10 ml of solution S add 1 ml of *calcium sulphate solution R*. After at least 15 min, any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S and 1 ml of *distilled water R*.

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (7 ppm).

Magnesium and alkali metals. To a mixture of 20 ml of solution S and 80 ml of *water R* add 2 g of *ammonium chloride R* and 2 ml of *dilute ammonia R1*, heat to boiling and pour into the boiling solution a hot solution of 5 g of *ammonium oxalate R* in 75 ml of *water R*. Allow to stand for 4 h, dilute to 200 ml with *water R* and filter through

a suitable filter. To 100 ml of the filtrate add 0.5 ml of *sulphuric acid R*. Evaporate to dryness on a water-bath and ignite to constant mass at 600 °C. The residue weighs not more than 5 mg (0.3 per cent).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (15 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

ASSAY

Dissolve 0.200 g in 100 ml of *water R*. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 21.91 mg of $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

01/2005:1183

CALCIUM DOBESILATE MONOHYDRATE**Calcii dobesilas monohydricum** $\text{C}_{12}\text{H}_{10}\text{CaO}_{10}\text{S}_2\text{H}_2\text{O}$ M_r 436.4**DEFINITION**

Calcium dobesilate monohydrate contains not less than 99.0 per cent and not more than the equivalent of 102.0 per cent of calcium di(2,5-dihydroxybenzenesulphonate), calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, hygroscopic powder, very soluble in water, freely soluble in ethanol, very slightly soluble in 2-propanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Dissolve 0.100 g in *water R* and dilute to 200.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *water R*. Examined between 210 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 221 nm and 301 nm. The specific absorbance at the maximum at 301 nm is 174 to 181.

B. Mix 1 ml of *ferric chloride solution R2*, 1 ml of a freshly prepared 10 g/l solution of *potassium ferricyanide R* and 0.1 ml of *nitric acid R*. To this mixture add 5 ml of freshly prepared solution S (see Tests): a blue colour and a precipitate are immediately produced.

C. 2 ml of freshly prepared solution S (see Tests) gives reaction (b) of calcium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S, when freshly prepared, is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.5 to 6.0.

Hydroquinone. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 2.0 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *hydroquinone R* in *water R* and dilute to 50 ml with the same solvent.

Apply to the plate 10 µl of each solution and dry the starting points in a current of cool air. Develop over a path of 15 cm using a mixture of 20 volumes of *methylene chloride R*, 30 volumes of *methyl acetate R* and 50 volumes of *ethyl acetate R*. Dry the plate in a current of hot air and examine in ultraviolet light at 254 nm. Any spot corresponding to hydroquinone in the chromatogram obtained with the test solution is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (15 ppm). Prepare the standard using 1.5 ml of *lead standard solution (10 ppm Pb) R*.

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (10 ppm).

Water (2.5.12): 4.0 per cent to 6.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Dissolve 0.200 g in a mixture of 10 ml of *water R* and 40 ml of *dilute sulphuric acid R*. Titrate with 0.1 M *cerium sulphate*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *cerium sulphate* is equivalent to 10.45 mg of $C_{12}H_{10}CaO_{10}S_2$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. benzene-1,4-diol (hydroquinone).

01/2005:0978

CALCIUM FOLINATE

Calcii folinas

DEFINITION

Calcium folinate contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of calcium (2S)-2-[[4-[[[(6RS)-2-amino-5-formyl-4-oxo-1,4,5,6,7,8-hexahydropteridin-6-yl]methyl]amino]benzoyl]amino]pentanedioate and not less than 7.54 per cent and not more than the equivalent of 8.14 per cent of Ca, both calculated with reference to the anhydrous and solvent-free substance.

CHARACTERS

A white or light yellow, amorphous or crystalline powder, sparingly soluble in water, practically insoluble in acetone and in alcohol. The amorphous form may produce supersaturated solutions in water.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, C, D.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *calcium folinate CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum quantity of *water R* and add dropwise sufficient *acetone R* to produce sufficient precipitate. Allow to stand for 15 min, collect the precipitate by centrifugation, wash the precipitate with two small quantities of *acetone R* and dry. Record new spectra using the residues.
- Examine by thin-layer chromatography (2.2.27), using *cellulose for chromatography F_{254 R}* as the coating substance.

Test solution. Dissolve 15 mg of the substance to be examined in a 3 per cent V/V solution of *ammonia R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 15 mg of *calcium folinate CRS* in a 3 per cent V/V solution of *ammonia R* and dilute to 5 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 1 volume of *isoamyl alcohol R* and 10 volumes of a 50 g/l solution of *citric acid R* previously adjusted to pH 8 with *ammonia R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives reaction (b) of calcium (2.3.1).

Carry out the tests and the assay as rapidly as possible, protected from actinic light.

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R*, heating at 40 °C if necessary, and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). The absorbance (2.2.25) of solution S, measured at 420 nm using *water R* as the compensation liquid, is not greater than 0.60.

pH (2.2.3). The pH of solution S is 6.8 to 8.0.

Specific optical rotation (2.2.7). The specific optical rotation is + 14.4 to + 18.0, determined on solution S and calculated with reference to the anhydrous and solvent-free substance.

Acetone, ethanol and methanol. Not more than 0.5 per cent of acetone, not more than 3.0 per cent of ethanol and not more than 0.5 per cent of methanol. Examine by head-space gas chromatography (2.2.28) using the standard additions method.

Test solution. Dissolve 0.25 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dilute 0.125 g of *acetone R*, 0.750 g of *ethanol R* and 0.125 g of *methanol R* in *water R* and dilute to 1000.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 10 m long and 0.32 mm in internal diameter coated with *styrene-divinylbenzene copolymer R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 4 ml/min,
- a flame-ionisation detector,

raising the temperature of the column from 125 °C to 185 °C at a rate of 10 °C/min and maintaining at 185 °C until the total run time is 15 min. Maintain the temperature of the injection port at 250 °C and that of the detector at 250 °C. Place the samples in a thermostatically controlled chamber at 80 °C for 20 min and pressurise them for 30 s. Repeat the injections at least three times.

Related substances. Examine the chromatograms obtained in the Assay. In the chromatogram obtained with the test solution: the area of any peak corresponding to formylfolic acid is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (1 per cent); the area of any peak, apart from the principal peak and any peak corresponding to formylfolic acid, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (d).

Chlorides (2.4.4). Dissolve 67 mg in 10 ml of *water R* and add 3 ml of *acetic acid R*. Filter and wash the precipitate with five quantities, each of 5 ml, of *water R*. Collect the filtrate and washings and dilute to 100 ml with *water R*. 15 ml of this solution complies with the limit test for chlorides (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test F for heavy metals (50 ppm). Prepare the standard using 5 ml of *lead standard solution (10 ppm Pb) R*.

Platinum. Not more than 20 ppm of Pt, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 1.00 g in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *platinum standard solution (30 ppm Pt) R*, diluted as necessary with a mixture of 1 volume of *nitric acid R* and 99 volumes of *water R*.

Measure the absorbance at 265.9 nm using a platinum hollow-cathode lamp as source of radiation.

Water (2.5.12). Not more than 17.0 per cent, determined on 0.200 g (ground to a very fine powder) by the semi-micro determination of water. Stir the substance to be examined in the titration solvent for about 6 min before titrating and use a suitable titrant that does not contain pyridine.

Bacterial endotoxins (2.6.14): less than 0.5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Calcium. Dissolve 0.400 g in 150 ml of *water R* and dilute to 300 ml with the same solvent. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 4.008 mg of Ca.

Calcium folinate. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *calcium folinate CRS* in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water R*.

Reference solution (c). Dissolve 10.0 mg of *formylfolic acid CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with *water R*.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *water R*.

Reference solution (e). Dilute 5.0 ml of reference solution (c) to 10.0 ml with reference solution (b).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: mix 220 ml of *methanol R* and 780 ml of a solution containing 2.0 ml of *tetrabutylammonium hydroxide solution (400 g/l) R* and 2.2 g of *disodium hydrogen phosphate R* previously adjusted to pH 7.8 with *phosphoric acid R*,
- as detector a spectrophotometer set at 280 nm, maintaining the temperature of the column at 40 °C.

Inject 10 µl of each solution. Continue the chromatography for 2.5 times the retention time of the principal peak in the chromatogram obtained with the test solution. The assay is not valid unless, in the chromatogram obtained with reference solution (e), the resolution between the peaks corresponding to calcium folinate and formylfolic acid is at least 2.2 and the relative standard deviation of the area of the principal peak for six replicate injections of reference solution (a) is at most 2.0 per cent.

Calculate the percentage content of $C_{20}H_{21}CaN_7O_7$ from the peak areas and the declared content of *calcium folinate CRS*.

STORAGE

Store in an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

01/2005:1399

A. (2S)-2-[(4-aminobenzoyl)amino]pentanedioic acid,

B. (2S)-2-[[4-[[[(6RS)-2-amino-5-formyl-4-oxo-1,4,5,6,7,8-hexahydropteridin-6-yl]methyl]formylamino]benzoyl]amino]pentanedioic acid (5,10-diformyltetrahydrofolic acid),

C. folic acid,

D. (2S)-2-[[4-[[[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]formylamino]benzoyl]amino]pentanedioic acid (10-formylfolic acid),

E. 4-[[[(6RS)-2-amino-5-formyl-4-oxo-1,4,5,6,7,8-hexahydropteridin-6-yl]methyl]amino]benzoic acid (5-formyltetrahydroptericoic acid),

F. R = CHO: (2S)-2-[[4-[[[(2-amino-4-oxo-1,4,7,8-tetrahydropteridin-6-yl)methyl]formylamino]benzoyl]amino]pentanedioic acid (10-formyldihydrofolic acid),

G. R = H: (2S)-2-[[4-[[[(2-amino-4-oxo-1,4,7,8-tetrahydropteridin-6-yl)methyl]amino]benzoyl]amino]pentanedioic acid (dihydrofolic acid).

CALCIUM GLUCOHEPTONATE

Calcii glucoheptonas

 $C_{14}H_{26}CaO_{16}$ M_r 490.4

DEFINITION

Calcium glucoheptonate is a mixture, in variable proportions, of calcium di(D-glycero-D-gulo-heptonate) and calcium di(D-glycero-D-ido-heptonate). It contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of calcium 2,3,4,5,6,7-hexahydroxyheptanoate, calculated with reference to the dried substance.

CHARACTERS

A white or very slightly yellow, amorphous powder, hygroscopic, very soluble in water, practically insoluble in acetone and in alcohol.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *cellulose for chromatography R1* as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in 1 ml of *water R*.

Reference solution (a). Dissolve 20 mg of *calcium glucoheptonate CRS* in 1 ml of *water R*.

Reference solution (b). Dissolve 10 mg of *calcium gluconate CRS* in 0.5 ml of the test solution and dilute to 1 ml with *water R*.

Apply separately to the plate, as bands 20 mm by 2 mm, 10 µl of each solution. Allow the tank to saturate for 10 min. Develop over a path of 12 cm using a freshly prepared mixture of 20 volumes of *anhydrous formic acid R*, 20 volumes of *water R*, 30 volumes of *acetone R* and 30 volumes of *butanol R*. Allow the plate to dry in air and spray with 0.02 M *potassium permanganate*. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. 0.2 ml of solution S (see Tests) gives reaction (b) of calcium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 6.0 to 8.0.

Reducing sugars. Dissolve 1.0 g in 5 ml of *water R* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool

01/2005:0172

rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of 0.025 *M* *iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* until the precipitate dissolves, titrate the excess of iodine with 0.05 *M* *sodium thiosulphate* using 1 ml of *starch solution R* added towards the end of the titration, as indicator. Not less than 12.6 ml of 0.05 *M* *sodium thiosulphate* is required (1 per cent expressed as glucose).

Cyanide. Dissolve 5.0 g in 50 ml of *water R* and add 2.0 g of *tartaric acid R*. Place this solution in a distillation apparatus (2.2.11). The plain bend adapter attached to the end of the condenser has a vertical part that is long enough to extend to 1 cm from the bottom of a 50 ml test-tube used as a receiver. Place 10 ml of *water R* and 2 ml of 0.1 *M* *sodium hydroxide* into the receiver. Distil, collect 25 ml of distillate and dilute to 50 ml with *water R*. To 25 ml of this solution add 25 mg of *ferrous sulphate R* and boil for a short time. After cooling to about 70 °C add 10 ml of *hydrochloric acid R1*. After 30 min, filter the solution and wash the filter. A yellow spot appears on the filter; there is no blue or green spot.

Chlorides (2.4.4). To 5 ml of solution S, add 10 ml of *water R*. The solution complies with the limit test for chlorides (100 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (100 ppm).

Iron (2.4.9). Dilute 2.5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron (40 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in 10 ml of *buffer solution pH 3.5 R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 3 h.

Bacterial endotoxins (2.6.14): less than 167 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.800 g in a mixture of 150 ml of *water R* and 2 ml of 3 *M* *hydrochloric acid*. While stirring, add 12.5 ml of 0.1 *M* *sodium edetate*, 15 ml of 1 *M* *sodium hydroxide* and 0.3 g of *hydroxynaphthol blue, sodium salt R*. Titrate with 0.1 *M* *sodium edetate* until the colour changes from violet to pure blue.

1 ml of 0.1 *M* *sodium edetate* is equivalent to 49.04 mg of $\text{C}_{14}\text{H}_{26}\text{CaO}_{16}$.

STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

CALCIUM GLUCONATE

Calcii gluconas

 $\text{C}_{12}\text{H}_{22}\text{CaO}_{14}\cdot\text{H}_2\text{O}$
 M_r 448.4

DEFINITION

Calcium gluconate contains not less than 98.5 per cent and not more than the equivalent of 102.0 per cent of calcium D-gluconate monohydrate.

CHARACTERS

A white, crystalline or granular powder, sparingly soluble in water, freely soluble in boiling water.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in 1 ml of *water R*, heating if necessary in a water-bath at 60 °C.

Reference solution. Dissolve 20 mg of *calcium gluconate CRS* in 1 ml of *water R*, heating if necessary in a water-bath at 60 °C.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *ethyl acetate R*, 10 volumes of *concentrated ammonia R*, 30 volumes of *water R* and 50 volumes of *alcohol R*. Dry the plate at 100 °C for 20 min. Allow to cool and spray with a 50 g/l solution of *potassium dichromate R* in a 40 per cent *m/m* solution of *sulphuric acid R*. After 5 min, the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Solution S (see Tests) gives the reactions of calcium (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *water R* heated to 60 °C and dilute to 50 ml with the same solvent.

Appearance of solution. At 60 °C, solution S is not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*). After cooling, it is not more opalescent than reference suspension II (2.2.1).

Organic impurities and boric acid. Introduce 0.5 g into a porcelain dish previously rinsed with *sulphuric acid R* and placed in a bath of iced water. Add 2 ml of cooled *sulphuric acid R* and mix. No yellow or brown colour develops. Add 1 ml of *chromotrope II B solution R*. A violet colour develops and does not become dark blue. Compare the colour obtained with that of a mixture of 1 ml of *chromotrope II B solution R* and 2 ml of cooled *sulphuric acid R*.

Sucrose and reducing sugars. Dissolve 0.5 g in a mixture of 2 ml of *hydrochloric acid R1* and 10 ml of *water R*. Boil for 5 min, allow to cool, add 10 ml of *sodium carbonate solution R* and allow to stand. Dilute to 25 ml with *water R*.

and filter. To 5 ml of the filtrate add 2 ml of *cupri-tartaric solution R* and boil for 1 min. Allow to stand for 2 min. No red precipitate is formed.

Chlorides (2.4.4). 12.5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dissolve 10.0 g with heating in a mixture of 10 ml of *acetic acid R* and 90 ml of *distilled water R*. 15 ml of the solution complies with the limit test for sulphates (100 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Heat the substance to be examined gradually and with care until it is almost completely transformed into a white mass and then ignite. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Magnesium and alkali metals. Dissolve 1.00 g in 100 ml of boiling *water R*, add 10 ml of *ammonium chloride solution R*, 1 ml of *ammonia R* and, dropwise, 50 ml of hot *ammonium oxalate solution R*. Allow to stand for 4 h, dilute to 200 ml with *water R* and filter. Evaporate 100 ml of the filtrate to dryness and ignite. The residue weighs not more than 2 mg (0.4 per cent).

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^3 micro-organisms per gram, determined by plate count.

ASSAY

Dissolve 0.8000 g in 20 ml of hot *water R*, allow to cool and dilute to 300 ml with *water R*. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 44.84 mg of $C_{12}H_{22}CaO_{14} \cdot H_2O$.

01/2005:0979

CALCIUM GLUCONATE FOR INJECTION

Calcii gluconas ad iniectionabile

$C_{12}H_{22}CaO_{14} \cdot H_2O$

M_r 448.4

DEFINITION

Calcium gluconate for injection contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of calcium D-gluconate monohydrate.

CHARACTERS

A white, crystalline or granular powder, sparingly soluble in water, freely soluble in boiling water.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in 1 ml of *water R*, heating if necessary in a water-bath at 60 °C.

Reference solution. Dissolve 20 mg of *calcium gluconate CRS* in 1 ml of *water R*, heating if necessary in a water-bath at 60 °C.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *concentrated ammonia R*, 10 volumes of *ethyl acetate R*, 30 volumes of *water R* and 50 volumes of *alcohol R*. Dry the plate at 100 °C for 20 min. Allow to cool and spray with a 50 g/l solution of *potassium dichromate R* in a 40 per cent *m/m* solution of *sulphuric acid R*. After 5 min, the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. About 20 mg gives reaction (b) of calcium (2.3.1).

TESTS

Solution S. To 10.0 g add 90 ml of boiling *distilled water R* and boil with stirring, for not more than 10 s, until completely dissolved. Dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S at 60 °C is not more intensely coloured than reference solution B₇ (2.2.2, *Method II*). After cooling to 20 °C, it is not more opalescent than reference suspension II (2.2.1).

pH (2.2.3). Dissolve 1.0 g in 20 ml of *carbon dioxide-free water R*, heating on a water-bath. The pH of the solution is 6.4 to 8.3.

Organic impurities and boric acid. Introduce 0.5 g into a porcelain dish previously rinsed with *sulphuric acid R* and placed in a bath of iced water. Add 2 ml of cooled *sulphuric acid R* and mix. No yellow or brown colour develops. Add 1 ml of *chromotrope II B solution R*. A violet colour develops and does not become dark blue. The solution is not more intensely coloured than that of a mixture of 1 ml of *chromotrope II B solution R* and 2 ml of cooled *sulphuric acid R*.

Oxalate. Not more than 100 ppm, determined by liquid chromatography (2.2.29).

Test solution. Dissolve 1.00 g of the substance to be examined in *water for chromatography R* and dilute to 100.0 ml with the same solvent.

Reference solution. Dissolve 1.00 g of the substance to be examined in *water for chromatography R*, add 0.5 ml of a 0.152 g/l solution of *sodium oxalate R* in *water for chromatography R* and dilute to 100.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a guard column 30 mm long and 4 mm in internal diameter packed with a suitable strong anion exchange resin (30 µm to 50 µm),
- two columns each 0.25 m long and 4 mm in internal diameter packed with a suitable strong anion exchange resin (30 µm to 50 µm),
- a micromembrane anion-suppressor column, connected in series with the guard and analytical columns; the anion-suppressor column is equipped with a micromembrane that separates the mobile phase from the suppressor regeneration solution, flowing countercurrent to the mobile phase at a rate of 4 ml/min,
- as mobile phase at a flow rate of 2 ml/min a solution prepared as follows: dissolve 0.212 g of *anhydrous sodium carbonate R* and 63 mg of *sodium hydrogen carbonate R* in *water for chromatography R* and dilute to 1000.0 ml with the same solvent,
- as suppressor regeneration solution a 1.23 g/l solution of *sulphuric acid R* in *water for chromatography R*,
- a conductance detector,
- a loop injector.

Inject 50 µl of the reference solution five times. The test is not valid unless the relative standard deviation of the peak area for oxalate in the chromatogram obtained with the reference solution is at most 2.0 per cent.

Inject 50 µl of each solution three times. Calculate the content of oxalate in parts per million using the following expression:

$$\frac{S_T \times 50}{S_R - S_T}$$

S_T = area of the oxalate peak in the chromatogram obtained with the test solution,

S_R = area of the oxalate peak in the chromatogram obtained with the reference solution.

Sucrose and reducing sugars. Dissolve 0.5 g in a mixture of 2 ml of *hydrochloric acid R1* and 10 ml of *water R*. Boil for 5 min, allow to cool, add 10 ml of *sodium carbonate solution R* and allow to stand for 10 min. Dilute to 25 ml with *water R* and filter. To 5 ml of the filtrate add 2 ml of *cupri-tartaric solution R* and boil for 1 min. Allow to stand for 2 min. No red precipitate is formed.

Chlorides (2.4.4). To 10 ml of previously filtered solution S add 5 ml of *water R*. The solution complies with the limit test for chlorides (50 ppm).

Phosphates (2.4.11). Dilute 1 ml of solution S to 100 ml with *water R*. The solution complies with the limit test for phosphates (100 ppm).

Sulphates (2.4.13). 15 ml of previously filtered solution S complies with the limit test for sulphates (50 ppm). Prepare the standard using a mixture of 7.5 ml of *sulphate standard solution (10 ppm SO₄) R* and 7.5 ml of *distilled water R*.

Iron. Not more than 5 ppm of Fe, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Introduce 2.0 g into a 100 ml polytetrafluoroethylene beaker and add 5 ml of *nitric acid R*. Boil, evaporating almost to dryness. Add 1 ml of *strong hydrogen peroxide solution R* and evaporate again almost to dryness. Repeat the hydrogen peroxide treatment until a clear solution is obtained. Using 2 ml of *nitric acid R*, transfer the solution into a 25 ml volumetric flask. Dilute to 25.0 ml with *dilute hydrochloric acid R*. In the same manner, prepare a compensation solution using 0.65 g of *calcium chloride R1* instead of the substance to be examined.

Reference solutions. Prepare the reference solutions from *iron solution (20 ppm Fe) R* diluted with *dilute hydrochloric acid R*.

Measure the absorbance at 248.3 nm, using an iron hollow-cathode lamp as source of radiation and an air-acetylene flame. Carry out a basic correction using a deuterium lamp.

Magnesium and alkali metals. To 0.50 g add a mixture of 1.0 ml of *dilute acetic acid R* and 10.0 ml of *water R* and rapidly boil, whilst shaking, until completely dissolved. To the boiling solution add 5.0 ml of *ammonium oxalate solution R* and allow to stand for at least 6 h. Filter through a sintered-glass filter (1.6) into a porcelain crucible. Carefully evaporate the filtrate to dryness and ignite. The residue weighs not more than 2 mg (0.4 per cent).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Bacterial endotoxins (2.6.14): less than 167 IU/g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10² micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* (2.6.13).

ASSAY

Dissolve 0.350 g in 20 ml of hot *water R*, allow to cool and dilute to 300 ml with *water R*. Carry out the complexometric titration of calcium (2.5.11). Use 50 mg of *calconecarboxylic acid triturate R*.

1 ml of 0.1 M *sodium edetate* is equivalent to 44.84 mg of C₁₂H₂₂CaO₁₄·H₂O.

01/2005:0980

CALCIUM GLYCEROPHOSPHATE

Calcii glycerophosphas

C₃H₇CaO₆P

M_r 210.1

DEFINITION

Calcium glycerophosphate is a mixture in variable proportions of calcium (RS)-2,3-dihydroxypropyl phosphate, and of calcium 2-hydroxy-1-(hydroxymethyl)ethyl phosphate, which may be hydrated. Calcium glycerophosphate contains not less than 18.6 per cent and not more than 19.4 per cent of Ca, calculated with reference to the dried substance.

CHARACTERS

A white powder, hygroscopic, sparingly soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Mix 1 g with 1 g of *potassium hydrogen sulphate R* in a test tube fitted with a glass tube. Heat strongly and direct the white vapour towards a piece of filter paper impregnated with a freshly prepared 10 g/l solution of *sodium nitroprusside R*. The filter paper develops a blue colour in contact with *piperidine R*.
- Ignite 0.1 g in a crucible. Take up the residue with 5 ml of *nitric acid R* and heat on a water-bath for 1 min. Filter. The filtrate gives reaction (b) of phosphates (2.3.1).
- It gives reaction (b) of calcium (2.3.1).

TESTS

Solution S. Dissolve 1.5 g at room temperature in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 150 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension III (2.2.1).

Acidity or alkalinity. To 100 ml of solution S add 0.1 ml of *phenolphthalein solution R*. Not more than 1.5 ml of 0.1 M *hydrochloric acid* or 0.5 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Citric acid. Shake 5.0 g with 20 ml of *carbon dioxide-free water R* and filter. To the filtrate add 0.15 ml of *sulphuric acid R* and filter again. To the filtrate add 5 ml of *mercuric sulphate solution R* and heat to boiling. Add 0.5 ml of a 3.2 g/l solution of *potassium permanganate R* and again heat to boiling. No precipitate is formed.

Glycerol and alcohol-soluble substances. Shake 1.000 g with 25 ml of *alcohol R* for 1 min. Filter. Evaporate the filtrate to dryness on a water-bath and dry the residue at 70 °C for 1 h. The residue weighs not more than 5 mg (0.5 per cent).

Chlorides (2.4.4). Dissolve 0.1 g in a mixture of 2 ml of *acetic acid R* and 8 ml of *water R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (500 ppm).

Phosphates (2.4.11). Dilute 2.5 ml of solution S to 100 ml with *water R*. The solution complies with the limit test for phosphates (400 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (0.1 per cent).

Arsenic (2.4.2). Dissolve 0.33 g in *water R* and dilute to 25 ml with the same solvent. The solution complies with limit test A for arsenic (3 ppm).

Iron (2.4.9). 0.20 g complies with the limit test for iron (50 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in 10 ml of *buffer solution pH 3.5 R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g by drying in an oven at 150 °C for 4 h.

ASSAY

Dissolve 0.200 g in *water R*. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 4.008 mg of Ca.

01/2005:0981
corrected

CALCIUM HYDROGEN PHOSPHATE, ANHYDROUS

Calcii hydrogenophosphas anhydricus

CaHPO_4

M_r 136.1

DEFINITION

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder, or colourless crystals.

Solubility: practically insoluble in water and in alcohol. It dissolves in dilute hydrochloric acid and in dilute nitric acid.

IDENTIFICATION

- It complies with the limits of the assay.
- Dissolve 0.1 g in a mixture of 5 ml of *dilute nitric acid R* and 5 ml of *water R*. The solution gives reaction (b) of phosphates (2.3.1).
- Dissolve 5 mg in 5 ml of *acetic acid R*. The solution gives reaction (b) of calcium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in 20 ml of *dilute hydrochloric acid R*. Filter if necessary. Add *dilute ammonia R1* until a precipitate is formed. Dissolve by adding the minimum quantity needed of *dilute hydrochloric acid R* and dilute to 50 ml with *distilled water R*.

Carbonates. Shake 0.5 g with 5 ml of *carbon dioxide-free water R* and add 1 ml of *hydrochloric acid R*. No effervescence is produced.

Chlorides (2.4.4): maximum 330 ppm.

Dissolve 0.5 g in a mixture of 1 ml of *nitric acid R* and 10 ml of *water R* and dilute to 50 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides.

Fluorides (2.4.5): maximum 100 ppm.

0.5 g complies with the limit test for fluorides.

Sulphates (2.4.13): maximum 0.5 per cent.

To 1 ml of solution S add 2 ml of *dilute hydrochloric acid R* and dilute to 25 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates.

Arsenic (2.4.2): maximum 10 ppm.

2 ml of solution S complies with limit test A.

Barium. To 10 ml of filtered solution S add 0.5 ml of *dilute sulphuric acid R*. Allow to stand for 15 min. Any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S and 0.5 ml of *distilled water R*.

Iron (2.4.9): maximum 400 ppm.

Dilute 0.5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron.

Heavy metals (2.4.8): maximum 40 ppm.

Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 2.0 per cent, determined on 1.000 g by drying in an oven at 150 °C for 2 h.

ASSAY

Dissolve 0.250 g in a mixture of 1 ml of *hydrochloric acid R1* and 5 ml of *water R*. Add 25.0 ml of 0.1 M *sodium edetate* and dilute to 200 ml with *water R*. Neutralise with *concentrated ammonia R*, add 10 ml of *ammonium chloride buffer solution pH 10.0 R* and about 50 mg of *mordant black 11 triturate R*. Titrate the excess of sodium edetate with 0.1 M *zinc sulphate* until the colour changes from blue to violet. Carry out a blank titration.

1 ml of 0.1 M *sodium edetate* is equivalent to 13.61 mg of CaHPO_4 .

01/2005:0116

CALCIUM HYDROGEN PHOSPHATE DIHYDRATE

Calcii hydrogenophosphas dihydricus

$\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$

M_r 172.1

DEFINITION

Content: 98.0 per cent to 105.0 per cent.

CHARACTERS

Appearance: white, crystalline powder.

Solubility: practically insoluble in cold water and in alcohol. It dissolves in dilute hydrochloric acid and in dilute nitric acid.

IDENTIFICATION

- Dissolve 0.1 g in a mixture of 5 ml of *dilute nitric acid R* and 5 ml of *water R*. The solution gives reaction (b) of phosphates (2.3.1).
- 5 mg gives reaction (b) of calcium (2.3.1).
- It complies with the limits of the assay.

TESTS

Solution S. Dissolve 2.5 g in 20 ml of *dilute hydrochloric acid R*, filter if necessary and add *dilute ammonia R1* until a precipitate is formed. Add just sufficient *dilute hydrochloric acid R* to dissolve the precipitate and dilute to 50 ml with *distilled water R*.

Carbonates. Shake 0.5 g with 5 ml of *carbon dioxide-free water R* and add 1 ml of *hydrochloric acid R*. No effervescence is produced.

Chlorides (2.4.4): maximum 330 ppm.

Dissolve 0.5 g in a mixture of 1 ml of *nitric acid R* and 10 ml of *water R* and dilute to 50 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides.

Fluorides (2.4.5): maximum 100 ppm.

0.5 g complies with the limit test for fluorides.

Sulphates (2.4.13): maximum 0.5 per cent.

To 1 ml of solution S add 2 ml of *dilute hydrochloric acid R* and dilute to 25 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates.

Arsenic (2.4.2): maximum 10 ppm.

2 ml of solution S complies with limit test A.

Barium. To 10 ml of solution S add 0.5 ml of *dilute sulphuric acid R*. After 15 min, any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S and 0.5 ml of *distilled water R*.

Iron (2.4.9): maximum 400 ppm.

0.5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron.

Heavy metals (2.4.8): maximum 40 ppm.

Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 0.300 g in a mixture of 1 ml of *hydrochloric acid R1* and 5 ml of *water R*. Add 25.0 ml of *0.1 M sodium edetate* and dilute to 200 ml with *water R*. Neutralise with *concentrated ammonia R*, add 10 ml of *ammonium chloride buffer solution pH 10.0 R* and about 50 mg of *mordant black 11 triturate R*. Titrate the excess of sodium edetate with *0.1 M zinc sulphate* until the colour changes from blue to violet. Carry out a blank titration.

1 ml of *0.1 M sodium edetate* is equivalent to 17.21 mg of $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$.

01/2005:1078
corrected

CALCIUM HYDROXIDE

Calcii hydroxidum

Ca(OH)_2

M_r 74.1

DEFINITION

Calcium hydroxide contains not less than 95.0 per cent and not more than the equivalent of 100.5 per cent of Ca(OH)_2 .

CHARACTERS

A white or almost white, fine powder, practically insoluble in water.

IDENTIFICATION

A. To 0.80 g in a mortar, add 10 ml of *water R* and 0.5 ml of *phenolphthalein solution R* and mix. The suspension turns red. On addition of 17.5 ml of *1 M hydrochloric acid*, the suspension becomes colourless without effervescing. The red colour occurs again when the mixture is triturated for 1 min. On addition of a further 6 ml of *1 M hydrochloric acid* and triturating, the solution becomes colourless.

B. Dissolve about 0.1 g in *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. 5 ml of the solution give reaction (b) of calcium (2.3.1).

TESTS

Matter insoluble in hydrochloric acid. Dissolve 2.0 g in 30 ml of *hydrochloric acid R*. Boil the solution and filter. Wash the residue with hot *water R*. The residue weighs not more than 10 mg (0.5 per cent).

Carbonates. Not more than 5.0 per cent of CaCO_3 .

Add 5.0 ml of *1 M hydrochloric acid* to the titrated solution obtained under Assay and titrate with *1 M sodium hydroxide* using 0.5 ml of *methyl orange solution R* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 50.05 mg of CaCO_3 .

Chlorides (2.4.4). Dissolve 0.30 g in a mixture of 2 ml of *nitric acid R* and 10 ml of *water R* and dilute to 30 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides (330 ppm).

Sulphates (2.4.13). Dissolve 0.15 g in a mixture of 5 ml of *dilute hydrochloric acid R* and 10 ml of *distilled water R* and dilute to 60 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates (0.4 per cent).

Arsenic (2.4.2). Dissolve 0.50 g in 5 ml of *brominated hydrochloric acid R* and dilute to 50 ml with *water R*. 25 ml of the solution complies with the limit test A for arsenic (4 ppm).

Magnesium and alkali metals. Dissolve 1.0 g in a mixture of 10 ml of *hydrochloric acid R* and 40 ml of *water R*. Boil and add 50 ml of a 63 g/l solution of *oxalic acid R*. Neutralise with *ammonia R* and dilute to 200 ml with *water R*. Allow to stand for 1 h and filter through a suitable filter. To 100 ml of the filtrate, add 0.5 ml of *sulphuric acid R*. Cautiously evaporate to dryness and ignite. The residue weighs not more than 20 mg (4.0 per cent calculated as sulphates).

Heavy metals (2.4.8). Dissolve 1.0 g in 10 ml of *hydrochloric acid R1* and evaporate to dryness on a water-bath. Dissolve the residue in 20 ml of *water R* and filter. 12 ml of the filtrate complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

To 1.500 g in a mortar, add 20 ml to 30 ml of *water R* and 0.5 ml of *phenolphthalein solution R*. Titrate with *1 M hydrochloric acid* by triturating the substance until the red colour disappears. The final solution is used in the tests for carbonates.

1 ml of *1 M hydrochloric acid* is equivalent to 37.05 mg of Ca(OH)_2 .

01/2005:0468

CALCIUM LACTATE PENTAHYDRATE**Calcii lactas pentahydricus**
 $\text{C}_6\text{H}_{10}\text{CaO}_6 \cdot x\text{H}_2\text{O}$ with $x \simeq 5$ M_r 218.2 (anhydrous substance)
DEFINITION

Calcium lactate pentahydrate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of calcium bis(2-hydroxypropanoate) or of a mixture of calcium (*R*)-, (*S*)- and (*RS*)-2-hydroxypropionates, calculated with reference to the dried substance. It contains not less than 22.0 per cent and not more than 27.0 per cent of water, determined by the loss on drying.

CHARACTERS

A white or almost white, crystalline or granular powder, slightly efflorescent, soluble in water, freely soluble in boiling water, very slightly soluble in alcohol.

IDENTIFICATION

- A. It complies with the test for loss on drying (see Tests).
- B. It gives the reaction of lactates (2.3.1).
- C. It gives reaction (b) of calcium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g with heating in *carbon dioxide-free water R* prepared from *distilled water R*, allow to cool and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R* and 0.5 ml of 0.01 *M hydrochloric acid*. The solution is colourless. Not more than 2.0 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to pink.

Volatile fatty acids. In a 100 ml ground-glass-stoppered flask stir 0.5 g with 1 ml of *phosphoric acid R*. Close the flask. Heat cautiously at 50 °C for 10 min. No unpleasant odour resembling that of the lower fatty acids is recognisable immediately after opening the flask.

Chlorides (2.4.4). 5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). 7.5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (400 ppm).

Barium. To 10 ml of solution S add 1 ml of *calcium sulphate solution R*. Allow to stand for 15 min. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of *distilled water R* and 10 ml of solution S.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Iron (2.4.9). 4 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (50 ppm).

Magnesium and alkali salts. To 20 ml of solution S add 20 ml of *water R*, 2 g of *ammonium chloride R* and 2 ml of *dilute ammonia RI*. Heat to boiling and rapidly add 40 ml of hot *ammonium oxalate solution R*. Allow to stand for

4 h, dilute to 100.0 ml with *water R* and filter. To 50.0 ml of the filtrate add 0.5 ml of *sulphuric acid R*, evaporate to dryness and ignite the residue to constant mass at 600 °C. The residue weighs not more than 5 mg (1 per cent).

Loss on drying (2.2.32): 22.0 per cent to 27.0 per cent, determined on 0.500 g by drying in an oven at 125 °C.

ASSAY

Dissolve 0.200 g in *water R* and dilute to 300 ml with the same solvent. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 *M sodium edetate* is equivalent to 21.82 mg of $\text{C}_6\text{H}_{10}\text{CaO}_6$.

01/2005:0469

CALCIUM LACTATE TRIHYDRATE**Calcii lactas trihydricus**
 $\text{C}_6\text{H}_{10}\text{CaO}_6 \cdot x\text{H}_2\text{O}$ with $x \simeq 3$ M_r 218.2 (anhydrous substance)
DEFINITION

Calcium lactate trihydrate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of calcium bis(2-hydroxypropanoate) or of a mixture of calcium (*R*)-, (*S*)- and (*RS*)-2-hydroxypropionates, calculated with reference to the dried substance. It contains not less than 15.0 per cent and not more than 20.0 per cent of water, determined by the loss on drying.

CHARACTERS

A white or almost white, crystalline or granular powder, soluble in water, freely soluble in boiling water, very slightly soluble in alcohol.

IDENTIFICATION

- A. It complies with the test for loss on drying (see Tests).
- B. It gives the reaction of lactates (2.3.1).
- C. It gives reaction (b) of calcium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g with heating in *carbon dioxide-free water R* prepared from *distilled water R*, allow to cool and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R* and 0.5 ml of 0.01 *M hydrochloric acid*. The solution is colourless. Not more than 2.0 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to pink.

Volatile fatty acids. In a 100 ml ground-glass-stoppered flask stir 0.5 g with 1 ml of *phosphoric acid R*. Close the flask. Heat cautiously at 50 °C for 10 min. No unpleasant odour resembling that of the lower fatty acids is recognisable immediately after opening the flask.

Chlorides (2.4.4). 5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). 7.5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (400 ppm).

Barium. To 10 ml of solution S add 1 ml of *calcium sulphate solution R*. Allow to stand for 15 min. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of *distilled water R* and 10 ml of solution S.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Iron (2.4.9). 4 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (50 ppm).

Magnesium and alkali salts. To 20 ml of solution S add 20 ml of *water R*, 2 g of *ammonium chloride R* and 2 ml of *dilute ammonia R1*. Heat to boiling and rapidly add 40 ml of hot *ammonium oxalate solution R*. Allow to stand for 4 h, dilute to 100.0 ml with *water R* and filter. To 50.0 ml of the filtrate add 0.5 ml of *sulphuric acid R*, evaporate to dryness and ignite the residue to constant mass at 600 °C. The residue weighs not more than 5 mg (1 per cent).

Loss on drying (2.2.32): 15.0 per cent to 20.0 per cent, determined on 0.500 g by drying in an oven at 125 °C.

ASSAY

Dissolve 0.200 g in *water R* and dilute to 300 ml with the same solvent. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 21.82 mg of $C_{20}H_{21}CaN_7O_7$.

01/2005:1606

CALCIUM LEVOFOLINATE PENTAHYDRATE

Calcii levofolinas pentahydricus

$C_{20}H_{21}CaN_7O_7 \cdot 5H_2O$

M_r 511.5 (anhydrous substance)

DEFINITION

Calcium (2S)-2-[[4-[[[(6S)-2-amino-5-formyl-4-oxo-1,4,5,6,7,8-hexahydropteridin-6-yl]methyl]amino]benzoyl]amino]pentanedioate pentahydrate.

Content:

- calcium levofolinate ($C_{20}H_{21}CaN_7O_7$; M_r 511.5): 97.0 per cent to 102.0 per cent (anhydrous and solvent-free substance).
- calcium (Ca; A_r 40.08): 7.54 per cent to 8.14 per cent (anhydrous and solvent-free substance).

CHARACTERS

Appearance: white or light yellow, amorphous or crystalline powder, hygroscopic.

Solubility: slightly soluble in water, practically insoluble in acetone and in alcohol.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, C, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *calcium folinate CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum quantity of *water R* and add dropwise sufficient *acetone R* to produce a precipitate. Allow to stand for 15 min, collect the precipitate by centrifugation, wash the precipitate twice with a minimum quantity of *acetone R* and dry. Record new spectra using the residues.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 15 mg of the substance to be examined in a 3 per cent V/V solution of *ammonia R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 15 mg of *calcium folinate CRS* in a 3 per cent V/V solution of *ammonia R* and dilute to 5 ml with the same solvent.

Plate: *cellulose for chromatography F₂₅₄ R*.

Mobile phase: the lower layer of a mixture of 1 volume of *isoamyl alcohol R* and 10 volumes of a 50 g/l solution of *citric acid R* previously adjusted to pH 8 with *ammonia R*.

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives reaction (b) of calcium (2.3.1).

Carry out the tests and the assay as rapidly as possible, protected from bright light.

TESTS

Solution S. Dissolve 0.40 g in *carbon dioxide-free water R*, heating at 40 °C if necessary, and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and its absorbance (2.2.25) at 420 nm has a maximum of 0.25.

pH (2.2.3): 7.5 to 8.5 for solution S.

Specific optical rotation (2.2.7): –10 to –15 (anhydrous and solvent-free substance).

Dissolve 0.200 g in *tris(hydroxymethyl)aminomethane solution R* previously adjusted to pH 8.1 with *sodium hydroxide solution R* or *hydrochloric acid R1* and dilute to 20.0 ml with the same solvent.

Acetone and ethanol. Head-space gas chromatography (2.2.28): use the standard additions method.

Test solution. Dissolve 0.25 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 0.125 g of *acetone R* and 0.750 g of *ethanol R* in *water R* and dilute to 1000.0 ml with *water R*.

Column:

- **material:** fused silica,
 - **size:** $l = 10$ m, $\varnothing = 0.32$ mm,
 - **stationary phase:** *styrene-divinylbenzene copolymer R*.
- Carrier gas:** *nitrogen for chromatography R*.
- Flow rate:** 4 ml/min.

Static head-space conditions which may be used:

- **equilibration temperature:** 80 °C,

- *equilibration time*: 20 min,
- *pressurisation time*: 30 s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 14	80 → 220
Injection port		110
Detector		270

Detection: flame ionisation.

Injection: at least 3 times.

Limits:

- *acetone*: maximum 0.5 per cent,
- *ethanol*: maximum 3.0 per cent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *calcium folinate CRS* in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water R*.

Reference solution (c). Dissolve 10.0 mg of *formylfolic acid CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with *water R*.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 20.0 ml with *water R*.

Reference solution (e). Dilute 5.0 ml of reference solution (c) to 10.0 ml with reference solution (b).

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4$ mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 μ m),
- *temperature*: 40 °C.

Mobile phase: mix 220 ml of *methanol R* and 780 ml of a solution containing 2.0 ml of *tetrabutylammonium hydroxide solution* (400 g/l) *R* and 2.2 g of *disodium hydrogen phosphate R* previously adjusted to pH 7.8 with *phosphoric acid R*. If necessary adjust the concentration of *methanol R* to achieve the prescribed resolution.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 10 μ l.

Run time: 2.5 times the retention time of the principal peak in the chromatogram obtained with the test solution.

System suitability: reference solution (e):

- *resolution*: minimum of 2.2 between the peaks due to folinate and to impurity D.

Limits:

- *impurity D*: not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.8 per cent),
- *any other impurity*: not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent),
- *total of other impurities*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),

- *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Impurity H. Liquid chromatography (2.2.29): use the normalisation procedure.

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *calcium folinate CRS* in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water R*.

Column:

- *size*: $l = 0.15$ m, $\varnothing = 4$ mm,
- *stationary phase*: *human albumin coated silica gel for chromatography R* (5 μ m),
- *temperature*: 40 °C.

Mobile phase: dissolve 9.72 g of *sodium dihydrogen phosphate R* in 890 ml of *water R* and adjust to pH 5.0 with *sodium hydroxide solution R*. Add 100 ml of *2-propanol R* and 10 ml of *acetonitrile R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 286 nm.

Injection: 10 μ l.

Retention times: levofolate = about 9 min;
impurity H = about 19 min.

System suitability:

- *resolution*: minimum of 5.0 between the peaks due to levofolate and to impurity H in the chromatogram obtained with reference solution (a). The sum of the areas of the 2 peaks is 100 per cent. The peak area of impurity H is 48 per cent to 52 per cent. In the chromatogram obtained with reference solution (b) 2 clearly visible peaks are obtained.

Limits:

- *impurity H*: maximum 0.5 per cent.

Chlorides: maximum 0.5 per cent.

Dissolve 0.300 g in 50 ml of *water R* heating at 40 °C if necessary. Add 10 ml of *2 M nitric acid* and titrate with *0.005 M silver nitrate* determining the end-point potentiometrically (2.2.20).

1 ml of *0.005 M silver nitrate* is equivalent to 0.177 mg of Cl.

Platinum: maximum 10 ppm.

Atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 1.0 g in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *platinum standard solution* (30 ppm Pt) *R*, diluted as necessary with a mixture of 1 volume of *nitric acid R* and 99 volumes of *water R*.

Source: platinum hollow-cathode lamp.

Wavelength: 265.9 nm.

Heavy metals (2.4.8): maximum 50 ppm.

1.0 g complies with limit test F. Prepare the standard using 5 ml of *lead standard solution* (10 ppm Pb) *R*.

Water (2.5.12): 10.0 per cent to 17.0 per cent, determined on 0.200 g (ground to a very fine powder). Stir the substance to be examined in the titration solvent for about 15 min before titrating and use *iodosulphurous reagent R* as titrant.

Bacterial endotoxins (2.6.14): less than 0.5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Calcium. Dissolve 0.400 g in 150 ml of *water R* and dilute to 300 ml with the same solvent. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M sodium edetate is equivalent to 4.008 mg of Ca.

Calcium folinate. Liquid chromatography (2.2.29) as described in the test for related substances.

Calculate the percentage content of $C_{20}H_{21}CaN_7O_7$ from the areas of the peaks in the chromatograms obtained with the test solution and reference solution (a) and the declared content of *calcium folinate CRS*.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. (2S)-2-[(4-aminobenzoyl)amino]pentanedioic acid,

B. (2S)-2-[[4-[[[(6R)-2-amino-5-formyl-4-oxo-1,4,5,6,7,8-hexahydropteridin-6-yl]methyl]formylamino]benzoyl]amino]pentanedioic acid (5,10-diformyltetrahydrofolic acid),

C. folic acid,

D. (2S)-2-[[4-[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]formylamino]benzoyl]amino]pentanedioic acid (10-formylfolic acid),

E. 4-[[[(6S)-2-amino-5-formyl-4-oxo-1,4,5,6,7,8-hexahydropteridin-6-yl]methyl]amino]benzoic acid (5-formyltetrahydropterioic acid),

F. R = CHO: (2S)-2-[[4-[[[(2-amino-4-oxo-1,4,7,8-tetrahydropteridin-6-yl)methyl]formylamino]benzoyl]amino]pentanedioic acid (10-formyldihydrofolic acid),

G. R = H: (2S)-2-[[4-[[[(2-amino-4-oxo-1,4,7,8-tetrahydropteridin-6-yl)methyl]amino]benzoyl]amino]pentanedioic acid (dihydrofolic acid),

H. (2S)-2-[[4-[[[(6R)-2-amino-5-formyl-4-oxo-1,4,5,6,7,8-hexahydropteridin-6-yl]methyl]amino]benzoyl]amino]pentanedioic acid.

01/2005:1296

CALCIUM LEVULINATE DIHYDRATE

Calcii laevulinas dihydricum

$C_{10}H_{14}CaO_6 \cdot 2H_2O$

M_r 306.3

DEFINITION

Calcium levulinate dihydrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of calcium di(4-oxopentanoate), calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, very slightly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, D, E.

Second identification: B, C, D, E.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *calcium levulinate dihydrate CRS*.

B. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 60 mg of the substance to be examined in *water R* and dilute to 1 ml with the same solvent.

Reference solution. Dissolve 60 mg of *calcium levulinate dihydrate CRS* in *water R* and dilute to 1 ml with the same solvent.

Apply separately to the plate 10 µl of each solution.

Develop over a path of 10 cm using a mixture of 10 volumes of *concentrated ammonia R*, 10 volumes of *ethyl acetate R*, 30 volumes of *water R* and 50 volumes

of *alcohol R*. Dry the plate at 100 °C to 105 °C for 20 min and allow to cool. Spray with a 30 g/l solution of *potassium permanganate R*. Dry the plate in a current of warm air for about 5 min or until the spots become yellow. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. To 1 ml of solution S (see Tests), add 20 ml of a 2.5 g/l solution of *dinitrophenylhydrazine R* in *dilute hydrochloric acid R*. Allow to stand for 15 min. Filter, wash the precipitate with *water R*. Dry the precipitate in an oven at 100 °C to 105 °C. The melting point (2.2.14) is 203 °C to 210 °C.

D. It gives reaction (b) of calcium (2.3.1).

E. It complies with the test for loss on drying (see Tests).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 6.8 to 7.8.

Oxidisable substances. To 1 ml of solution S, add 10 ml of *water R*, 1 ml of *dilute sulphuric acid R* and 0.25 ml of a 3.0 g/l solution of *potassium permanganate R*. Mix. After 5 min, the violet colour of the mixture is still visible.

Sucrose and reducing sugars. To 5 ml of solution S, add 2 ml of *hydrochloric acid R1* and dilute to 10 ml with *water R*. Heat to boiling for 5 min and allow to cool. Add 10 ml of *sodium carbonate solution R*. Allow to stand for 5 min, dilute to 25 ml with *water R* and filter. To 5 ml of the filtrate, add 2 ml of *cupri-tartaric solution R* and heat to boiling for 1 min. No red precipitate is formed.

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (50 ppm).

Sulphates (2.4.13). Dilute 7.5 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (200 ppm).

Magnesium and alkali metals. To 10 ml of solution S, add 80 ml of *water R*, 10 ml of *ammonium chloride solution R* and 1 ml of *ammonia R*. Heat to boiling. To the boiling solution, add dropwise 50 ml of warm *ammonium oxalate solution R*. Allow to stand for 4 h, then dilute to 200 ml with *water R* and filter. To 100 ml of the filtrate, add 0.5 ml of *sulphuric acid R*. Evaporate to dryness on a water-bath and ignite to constant mass at 600 °C. The residue weighs not more than 5.0 mg (1.0 per cent).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): 11.0 per cent to 12.5 per cent, determined on 0.200 g by drying at 100 °C to 105 °C.

Pyrogens (2.6.8). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 4 ml of a solution containing per millilitre 50 mg of the substance to be examined.

ASSAY

Dissolve 0.240 g in 50 ml of *water R*. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 27.03 mg of C₁₀H₁₄CaO₆.

STORAGE

Store protected from light.

LABELLING

The label states, where applicable, that the substance is apyrogenic.

01/2005:0470

CALCIUM PANTOTHENATE

Calcii pantothenas

C₁₈H₃₂CaN₂O₁₀

M_r 476.5

DEFINITION

Calcium pantothenate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of calcium bis[3-[(2*R*)-2,4-dihydroxy-3,3-dimethylbutanoyl]amino]propanoate], calculated with reference to the dried substance.

CHARACTERS

A white powder, slightly hygroscopic, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

- It complies with the test for specific optical rotation (see Tests).
- Examine the chromatograms obtained in the test for 3-aminopropionic acid. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- To 1 ml of solution S (see Tests) add 1 ml of *dilute sodium hydroxide solution R* and 0.1 ml of *copper sulphate solution R*. A blue colour develops.
- It gives reaction (a) of calcium (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 6.8 to 8.0.

Specific optical rotation (2.2.7): + 25.5 to + 27.5, determined on solution S and calculated with reference to the dried substance.

3-Aminopropionic acid. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.2 g of the substance to be examined in *water R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *water R*.

Reference solution (a). Dissolve 20 mg of *calcium pantothenate CRS* in *water R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *3-aminopropionic acid R* in *water R* and dilute to 50 ml with the same solvent. Apply separately to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of 35 volumes of *water R* and 65 volumes of *ethanol R*. Dry the plate in a current of air and spray with *ninhydrin solution R1*. Heat at 110 °C for 10 min. Any spot corresponding to 3-aminopropionic acid in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Chlorides (2.4.4). 5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (200 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 3.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.180 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of *0.1 M perchloric acid* is equivalent to 23.83 mg of $C_{18}H_{32}CaN_2O_{10}$.

STORAGE

Store in an airtight container.

01/2005:1052

CALCIUM PHOSPHATE

Tricalcii phosphas

DEFINITION

Calcium phosphate consists of a mixture of calcium phosphates. It contains not less than 35.0 per cent and not more than the equivalent of 40.0 per cent of Ca (A_r 40.08).

CHARACTERS

A white or almost white powder, practically insoluble in water. It dissolves in dilute hydrochloric acid and in dilute nitric acid.

IDENTIFICATION

- Dissolve 0.1 g in 5 ml of a 25 per cent *V/V* solution of *nitric acid R*. The solution gives reaction (b) of phosphates (2.3.1).
- It gives reaction (b) of calcium (2.3.1). Filter before adding *potassium ferrocyanide solution R*.
- It complies with the limits of the assay.

TESTS

Solution S. Dissolve 2.50 g in 20 ml of *dilute hydrochloric acid R*. If the solution is not clear, filter it. Add *dilute ammonia R1* dropwise until a precipitate is formed. Dissolve the precipitate by adding *dilute hydrochloric acid R* and dilute to 50 ml with *distilled water R*.

Chlorides (2.4.4). Dissolve 0.22 g in a mixture of 1 ml of *nitric acid R* and 10 ml of *water R* and dilute to 100 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides (0.15 per cent).

Fluorides. Not more than 75 ppm of F, determined potentiometrically (2.2.36, *Method I*) using a fluoride-selective indicator electrode and a silver-silver chloride reference electrode.

Test solution. In a 50 ml volumetric flask, dissolve 0.250 g in *0.1 M hydrochloric acid*, add 5.0 ml of *fluoride standard solution (1 ppm F) R* and dilute to 50.0 ml with *0.1 M hydrochloric acid*. To 20.0 ml of the solution add 20.0 ml of *total-ionic-strength-adjustment buffer R* and 3 ml of an 82 g/l solution of *anhydrous sodium acetate R*. Adjust to pH 5.2 with *ammonia R* and dilute to 50.0 ml with *distilled water R*.

Reference solutions. To 5.0 ml, 2.0 ml, 1.0 ml, 0.5 ml and 0.25 ml of *fluoride standard solution (10 ppm F) R* add 20.0 ml of *total-ionic-strength-adjustment buffer R* and dilute to 50.0 ml with *distilled water R*.

Carry out the measurements on 20.0 ml of each solution. Calculate the concentration of fluorides using the calibration curve, taking into account the addition of fluoride to the test solution.

Sulphates (2.4.13). Dilute 1 ml of solution S to 25 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates (0.5 per cent).

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (4 ppm).

Iron (2.4.9). Dilute 0.5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron (400 ppm).

Heavy metals (2.4.8). Dilute 13 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (30 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Acid-insoluble matter. Dissolve 5.0 g in a mixture of 10 ml of *hydrochloric acid R* and 30 ml of *water R*. Filter, wash the residue with *water R* and dry to constant mass at 100 °C to 105 °C. The residue weighs not more than 10 mg (0.2 per cent).

Loss on ignition. Not more than 8.0 per cent, determined on 1.000 g by ignition at 800 °C for 30 min.

ASSAY

Dissolve 0.200 g in a mixture of 1 ml of *hydrochloric acid R1* and 5 ml of *water R*. Add 25.0 ml of *0.1 M sodium edetate* and dilute to 200 ml with *water R*. Adjust to about pH 10 with *concentrated ammonia R*. Add 10 ml of *ammonium chloride buffer solution pH 10.0 R* and a few milligrams of *mordant black 11 triturate R*. Titrate the excess sodium edetate with *0.1 M zinc sulphate* until the colour changes from blue to violet.

1 ml of *0.1 M sodium edetate* is equivalent to 4.008 mg of Ca.

01/2005:0882

CALCIUM STEARATE

Calcii stearas

DEFINITION

Calcium stearate is a mixture of calcium salts of different fatty acids consisting mainly of stearic acid [$(C_{17}H_{35}COO)_2Ca$; M_r 607] and palmitic acid [$(C_{15}H_{31}COO)_2Ca$; M_r 550.9] with minor proportions of other fatty acids. It contains not less than 6.4 per cent and not more than 7.4 per cent of Ca (A_r 40.08), calculated with reference to the dried substance. The

fatty acid fraction contains not less than 40.0 per cent of stearic acid and the sum of stearic acid and palmitic acid is not less than 90.0 per cent.

CHARACTERS

A fine, white or almost white, crystalline powder, practically insoluble in water and in alcohol.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

- The residue obtained in the preparation of solution S (see Tests) has a freezing point (2.2.18) not lower than 53 °C.
- The acid value of the fatty acids (2.5.1) is 195 to 210, determined on 0.200 g of the residue obtained in the preparation of solution S dissolved in 25 ml of the prescribed mixture of solvents.
- Examine the chromatograms obtained in the test for fatty acid composition. The retention times of the principal peaks in the chromatogram obtained with the test solution are approximately the same as those of the principal peaks in the chromatogram obtained with the reference solution.
- Neutralise 5 ml of solution S to *red litmus paper R* using *strong sodium hydroxide solution R*. The solution gives reaction (b) of calcium (2.3.1).

TESTS

Solution S. To 5.0 g add 50 ml of *peroxide-free ether R*, 20 ml of *dilute nitric acid R* and 20 ml of *distilled water R*. Boil under a reflux condenser until dissolution is complete. Allow to cool. In a separating funnel, separate the aqueous layer and shake the ether layer with 2 quantities, each of 5 ml, of *distilled water R*. Combine the aqueous layers, wash with 15 ml of *peroxide-free ether R* and dilute the aqueous layer to 50 ml with *distilled water R* (solution S). Evaporate the ether layer to dryness and dry the residue at 100-105 °C. Keep the residue for identification tests A and B.

Acidity or alkalinity. To 1.0 g add 20 ml of *carbon dioxide-free water R* and boil for 1 min with continuous shaking. Cool and filter. To 10 ml of the filtrate add 0.05 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Chlorides (2.4.4). Dilute 0.5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (0.1 per cent).

Sulphates (2.4.13). Dilute 0.5 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (0.3 per cent).

Cadmium. Not more than 3 ppm of Cd, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Place 50.0 mg of the substance to be examined in a polytetrafluoroethylene digestion bomb and add 0.5 ml of a mixture of 1 volume of *hydrochloric acid R* and 5 volumes of *cadmium- and lead-free nitric acid R*. Allow to digest at 170 °C for 5 h. Allow to cool. Dissolve the residue in *water R* and dilute to 5.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (10 ppm Cd) R*, diluted if necessary with a 1 per cent V/V solution of *hydrochloric acid R*.

Measure the absorbance at 228.8 nm using a cadmium hollow-cathode lamp as source of radiation and a graphite furnace as atomic generator.

Lead. Not more than 10 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Use the solution described in the test for cadmium.

Reference solutions. Prepare the reference solutions using *lead standard solution (10 ppm Pb) R*, diluted if necessary with *water R*.

Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as source of radiation and a graphite furnace as atomic generator. Depending on the apparatus, the line at 217.0 nm may be used.

Nickel. Not more than 5 ppm of Ni, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Use the solution described in the test for cadmium.

Reference solutions. Prepare the reference solutions using *nickel standard solution (10 ppm Ni) R*, diluted if necessary with *water R*.

Measure the absorbance at 232.0 nm using a nickel hollow-cathode lamp as source of radiation and a graphite furnace as atomic generator.

Loss on drying (2.2.32). Not more than 6.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram, determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

ASSAY

Calcium. To 0.500 g in a 250 ml conical flask add 50 ml of a mixture of equal volumes of *butanol R* and *ethanol R*, 5 ml of *concentrated ammonia R*, 3 ml of *ammonium chloride buffer solution pH 10.0 R*, 30.0 ml of 0.1 M *sodium edetate* and 15 mg of *mordant black 11 triturate R*. Heat to 45-50 °C until the solution is clear. Cool and titrate with 0.1 M *zinc sulphate* until the colour changes from blue to violet. Carry out a blank titration.

1 ml of 0.1 M *sodium edetate* is equivalent to 4.008 mg of Ca.

Fatty acid composition. Examine by gas chromatography (2.2.28).

Test solution. In a conical flask fitted with a reflux condenser, dissolve 0.10 g of the substance to be examined in 5 ml of *boron trifluoride-methanol solution R*. Boil under a reflux condenser for 10 min. Add 4 ml of *heptane R* through the condenser and boil again under a reflux condenser for 10 min. Allow to cool. Add 20 ml of a *saturated sodium chloride solution R*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry over 0.2 g of *anhydrous sodium sulphate R*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane R*.

Reference solution. Prepare the reference solution in the same manner as the test solution using 50.0 mg of *palmitic acid CRS* and 50.0 mg of *stearic acid CRS* instead of calcium stearate.

The chromatographic procedure may be carried out using:

- a fused-silica column 30 m long and 0.32 mm in internal diameter coated with *macrogol 20 000 R* (film thickness 0.5 µm),
- helium for chromatography R* as the carrier gas at a flow rate of 2.4 ml/min,

— a flame-ionisation detector,
with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 2	70	-	isothermal
	2 - 36	70 → 240	5	linear gradient
	36 - 41	240	-	isothermal
Injection port		220		
Detector		260		

Inject 1 µl of the reference solution. When the chromatogram is recorded in the prescribed conditions, the retention time of methyl palmitate relative to that of methyl stearate is about 0.88. The test is not valid unless, in the chromatogram obtained with the reference solution, the resolution between the peaks corresponding to methyl stearate and methyl palmitate is at least 5.0.

Inject 1 µl of the test solution. Calculate the percentage content of stearic acid and palmitic acid from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, disregarding the peak due to the solvent.

Iron (2.4.9). To 0.25 g add a mixture of 5 ml of *hydrochloric acid R* and 20 ml of *water R*. Heat to boiling, cool and filter. 10 ml of the filtrate complies with the limit test for iron (100 ppm).

Heavy metals (2.4.8). To 2.5 g add a mixture of 2 ml of *hydrochloric acid R* and 15 ml of *water R*. Heat to boiling. Cool and then add 0.5 ml of *phenolphthalein solution R*. Cautiously add *concentrated ammonia R* until the colour changes to pink. Add 0.5 ml of *glacial acetic acid R* and dilute to 25 ml with *water R*. Filter. 12 ml of the filtrate complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on ignition: 18.0 per cent to 22.0 per cent, determined on 1.000 g by ignition to constant mass at 800 °C.

ASSAY

Dissolve 0.150 g in 120 ml of *water R*. Carry out the complexometric titration of calcium (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 17.22 mg of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$.

01/2005:1297

CALENDULA FLOWER

Calendulae flos

DEFINITION

Calendula flower consists of the whole or cut, dried, and fully opened flowers which have been detached from the receptacle of the cultivated, double-flowered varieties of *Calendula officinalis* L. It contains not less than 0.4 per cent of flavonoids, calculated as hyperoside ($\text{C}_{21}\text{H}_{20}\text{O}_{12}$, M_r 464.4) with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- The ligulate florets consist of a yellow or orange-yellow ligule, about 3 mm to 5 mm wide and about 7 mm in the middle part, with a three toothed apex and a hairy, partly sickle-shaped yellowish-brown to orange-brown tube with a projecting style and a bifid stigma occasionally with a partly bent yellowish-brown to orange-brown ovary. The tubular florets, about 5 mm long, are present and consist of the yellow, orange-red or red-violet five lobed corolla and the yellowish-brown or orange-brown tube, hairy in its lower part, mostly with a partly bent yellowish-brown to orange-brown ovary.
- Reduce to a powder (355). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of the corollas containing light yellow oil droplets, some with fairly large anomocytic stomata (2.8.3), others containing prisms and very small cluster crystals of calcium oxalate; covering trichomes biseriate, multicellular and conical, glandular trichomes with a uniseriate or biseriate, multicellular biseriate stalk and a large, ovoid, biseriate and multicellular head; spherical pollen grains up to about 40 µm in diameter with a sharply spiny exine and three germinal pores; occasional fragments of the stigmas with short, bulbous papillae.
- Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

CALCIUM SULPHATE DIHYDRATE

Calcii sulfas dihydricus

 M_r 172.2

DEFINITION

Calcium sulphate dihydrate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$.

CHARACTERS

A white, fine powder, very slightly soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- It complies with the test for loss on ignition (see Tests).
- Solution S (see Tests) gives reaction (a) of sulphates (2.3.1).
- Solution S gives reaction (a) of calcium (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in 50 ml of a 10 per cent V/V solution of *hydrochloric acid R* by heating at 50 °C for 5 min. Allow the solution to cool.

Acidity or alkalinity. Shake 1.5 g with 15 ml of *carbon dioxide-free water R* for 5 min. Allow to stand for 5 min and filter. To 10 ml of the filtrate, add 0.1 ml of *phenolphthalein solution R* and 0.25 ml of 0.01 M *sodium hydroxide*. The solution is red. Add 0.30 ml of 0.01 M *hydrochloric acid*. The solution is colourless. Add 0.2 ml of *methyl red solution R*. The solution is reddish-orange.

Chlorides (2.4.4). Shake 0.5 g with 15 ml of *water R* for 5 min. Allow to stand for 15 min and filter. Dilute 5 ml of the filtrate to 15 ml with *water R*. The solution complies with the limit test for chlorides (300 ppm).

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (10 ppm).

Test solution. To 1.0 g of the powdered drug (500) add 10 ml of *methanol R* and heat on a water-bath under a reflux condenser for 10 min. Cool and filter.

Reference solution. Dissolve 1.0 mg of *caffeic acid R*, 1.0 mg of *chlorogenic acid R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Apply to the plate, as bands, 20 µl of the test solution and 10 µl of the reference solution. Develop over a path of 10 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 10 volumes of *water R* and 80 volumes of *ethyl acetate R*. Allow the plate to dry at 100 °C to 105 °C and spray the still warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in the lower part a yellowish-brown fluorescent zone (rutin), in the middle part a light bluish fluorescent zone (chlorogenic acid) and in the upper part a light bluish fluorescent zone (caffeic acid). The chromatogram obtained with the test solution shows a yellowish-brown fluorescent zone corresponding in position to the zone due to rutin in the chromatogram obtained with the reference solution, below and directly above it, it shows a yellowish-green fluorescent zone and a light bluish fluorescent zone corresponding to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution, a yellowish-green fluorescent zone above it and a light bluish fluorescent zone shortly below the zone due to caffeic acid in the chromatogram obtained with the reference solution. Further zones are present.

TESTS

Foreign matter (2.8.2). Not more than 5 per cent of bracts and not more than 2 per cent of other foreign matter.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug (500) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 10.0 per cent.

ASSAY

Stock solution. In a 100 ml round-bottomed flask introduce 0.800 g of the powdered drug (500), 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 7 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton in a 100 ml flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with two quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool to room temperature, filter the liquid through a plug of absorbent cotton then filter the combined acetone solution through a filter-paper in the volumetric flask and dilute to 100.0 ml with *acetone R* by rinsing of the flask and the filter. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and extract the mixture with one quantity of 15 ml and then three quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, rinse with two quantities, each of 50 ml, of *water R*, filter the extract over 10 g of *anhydrous sodium sulphate R* in to a 50 ml volumetric flask and dilute to 50.0 ml with *ethyl acetate R*.

Test solution. To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Compensation solution. Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (2.2.25) of the test solution after 30 min, by comparison with the compensation solution at 425 nm.

Calculate the percentage content of flavonoids, calculated as hyperoside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = absorbance at 425 nm,

m = mass of the substance to be examined in grams.

STORAGE

Store protected from light.

01/2005:1400

D-CAMPHOR

D-Camphora

$C_{10}H_{16}O$

M_r 152.2

DEFINITION

(1*R*,4*R*)-1,7,7-Trimethylbicyclo[2.2.1]heptan-2-one.

CHARACTERS

Appearance: white, crystalline powder or friable, crystalline masses.

Highly volatile even at room temperature.

Solubility: slightly soluble in water, very soluble in alcohol and in light petroleum, freely soluble in fatty oils, very slightly soluble in glycerol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Specific optical rotation (see Tests).

B. Melting point (2.2.14): 175 °C to 179 °C.

C. Infrared absorption spectrophotometry (2.2.24).

Comparison: *racemic camphor CRS*.

D. Dissolve 1.0 g in 30 ml of *methanol R*. Add 1.0 g of *hydroxylamine hydrochloride R* and 1.0 g of *anhydrous sodium acetate R*. Boil under a reflux condenser for 2 h. Allow to cool and add 100 ml of *water R*. Filter, wash the precipitate obtained with 10 ml of *water R* and recrystallise from 10 ml of a mixture of 4 volumes of *alcohol R* and 6 volumes of *water R*. The crystals, dried *in vacuo*, melt (2.2.14) at 118 °C to 121 °C.

TESTS

Carry out the weighings and dissolution rapidly.

Solution S. Dissolve 2.50 g in 10 ml of *alcohol R* and dilute to 25.0 ml with the same solvent.

Test solution. To 1.0 g of the powdered drug (500) add 10 ml of *methanol R* and heat on a water-bath under a reflux condenser for 10 min. Cool and filter.

Reference solution. Dissolve 1.0 mg of *caffeic acid R*, 1.0 mg of *chlorogenic acid R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Apply to the plate, as bands, 20 µl of the test solution and 10 µl of the reference solution. Develop over a path of 10 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 10 volumes of *water R* and 80 volumes of *ethyl acetate R*. Allow the plate to dry at 100 °C to 105 °C and spray the still warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in the lower part a yellowish-brown fluorescent zone (rutin), in the middle part a light bluish fluorescent zone (chlorogenic acid) and in the upper part a light bluish fluorescent zone (caffeic acid). The chromatogram obtained with the test solution shows a yellowish-brown fluorescent zone corresponding in position to the zone due to rutin in the chromatogram obtained with the reference solution, below and directly above it, it shows a yellowish-green fluorescent zone and a light bluish fluorescent zone corresponding to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution, a yellowish-green fluorescent zone above it and a light bluish fluorescent zone shortly below the zone due to caffeic acid in the chromatogram obtained with the reference solution. Further zones are present.

D-CAMPHOR

D-Camphora

$C_{10}H_{16}O$

M_r 152.2

DEFINITION

(1*R*,4*R*)-1,7,7-Trimethylbicyclo[2.2.1]heptan-2-one.

CHARACTERS

Appearance: white, crystalline powder or friable, crystalline masses.

Highly volatile even at room temperature.

Solubility: slightly soluble in water, very soluble in alcohol and in light petroleum, freely soluble in fatty oils, very slightly soluble in glycerol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Specific optical rotation (see Tests).

B. Melting point (2.2.14): 175 °C to 179 °C.

C. Infrared absorption spectrophotometry (2.2.24).

Comparison: *racemic camphor CRS*.

D. Dissolve 1.0 g in 30 ml of *methanol R*. Add 1.0 g of *hydroxylamine hydrochloride R* and 1.0 g of *anhydrous sodium acetate R*. Boil under a reflux condenser for 2 h. Allow to cool and add 100 ml of *water R*. Filter, wash the precipitate obtained with 10 ml of *water R* and recrystallise from 10 ml of a mixture of 4 volumes of *alcohol R* and 6 volumes of *water R*. The crystals, dried *in vacuo*, melt (2.2.14) at 118 °C to 121 °C.

TESTS

Carry out the weighings and dissolution rapidly.

Solution S. Dissolve 2.50 g in 10 ml of *alcohol R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R1*. The solution is colourless. Not more than 0.2 ml of 0.1 M sodium hydroxide is required to change the colour of the indicator.

Specific optical rotation (2.2.7): + 40.0 to + 43.0, determined on solution S.

Related substances. Gas chromatography (2.2.28).

Test solution. Dissolve 2.50 g of the substance to be examined in *heptane R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *heptane R*.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 20.0 ml with *heptane R*.

Reference solution (c). Dissolve 0.50 g of *borneol R* in *heptane R* and dilute to 25.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *heptane R*.

Reference solution (d). Dissolve 50 mg of *linalol R* and 50 mg of *bornyl acetate R* in *heptane R* and dilute to 100.0 ml with the same solvent.

Column:

- size: $l = 30$ m, $\varnothing = 0.25$ mm,
- stationary phase: *macrogol 20 000 R* (0.25 μ m).

Carrier gas: *helium for chromatography R*.

Split ratio: 1:70.

Flow rate: 45 cm/s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	50
	10 - 35	50 → 100
	35 - 45	100 → 200
	45 - 55	200
Injection port		220
Detector		250

Detection: flame ionisation.

Injection: 1 μ l.

System suitability: reference solution (d).

- resolution: minimum 3.0 between the peaks due to *bornyl acetate* and to *linalol*.

Limits:

- *borneol*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent),
- any other impurity: not more than half of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- total of other impurities: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent),
- disregard limit: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Halogens: maximum 100 ppm.

Dissolve 1.0 g in 10 ml of *2-propanol R* in a distillation flask. Add 1.5 ml of *dilute sodium hydroxide solution R* and 50 mg of *nickel-aluminium alloy R*. Heat on a water-bath until the

2-propanol R has evaporated. Allow to cool and add 5 ml of *water R*. Mix and filter through a wet filter previously washed with *water R* until free from chlorides. Dilute the filtrate to 10.0 ml with *water R*. To 5.0 ml of the solution, add *nitric acid R* dropwise until the precipitate which forms is redissolved and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (2.4.4).

Residue on evaporation (2.8.9): maximum 0.05 per cent.

Evaporate 2.0 g on a water-bath and dry in an oven at 100-105 °C for 1 h. The residue weighs a maximum of 1 mg.

Water. Dissolve 1 g in 10 ml of *light petroleum R*. The solution is clear (2.2.1).

IMPURITIES

A. 2,6,6-trimethylbicyclo[3.1.1]hept-2-ene (α -pinene),

B. 2,2-dimethyl-3-methylenebicyclo[2.2.1]heptane (camphene),

C. 6,6-dimethyl-2-methylenebicyclo[3.1.1]heptane (β -pinene),

D. 3,3-dimethyl-2-oxabicyclo[2.2.2]octane (cineole),

E. R1 = CH₃, R2 + R3 = O: 1,3,3-trimethylbicyclo[2.2.1]heptan-2-one (fenchone),

- I. R = OH, R' = H: *exo*-1,7,7-trimethylbicyclo[2.2.1]heptan-2-ol (*exo*-borneol),
 J. R = H, R' = OH: *endo*-1,7,7-trimethylbicyclo[2.2.1]heptan-2-ol (*endo*-borneol).

01/2005:0655

CAMPHOR, RACEMIC

Camphora racemica

C₁₀H₁₆OM_r 152.2

DEFINITION

Racemic camphor is (1*RS*,4*RS*)-1,7,7-trimethylbicyclo[2.2.1]heptan-2-one.

CHARACTERS

A white, crystalline powder or friable, crystalline masses, highly volatile even at room temperature, slightly soluble in water, very soluble in alcohol and in light petroleum, freely soluble in fatty oils, very slightly soluble in glycerol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

- A. It complies with the test for optical rotation (see Tests).
 B. Melting point (2.2.14): 172 °C to 180 °C.
 C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *racemic camphor CRS*. Examine the substances as mulls in *liquid paraffin R*.
 D. Dissolve 1.0 g in 30 ml of *methanol R*. Add 1.0 g of *hydroxylamine hydrochloride R* and 1.0 g of *anhydrous sodium acetate R*. Boil under a reflux condenser for 2 h. Allow to cool and add 100 ml of *water R*. A precipitate is formed. Filter, wash with 10 ml of *water R* and recrystallize from 10 ml of a mixture of 4 volumes of *alcohol R* and 6 volumes of *water R*. The crystals, dried *in vacuo*, melt (2.2.14) at 118 °C to 121 °C.

TESTS

Carry out the weighings rapidly.

Solution S. Dissolve 2.50 g in 10 ml of *alcohol R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 1.0 g in 10 ml of *alcohol R* and add 0.1 ml of *phenolphthalein solution R1*. The solution is colourless. Not more than 0.2 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Optical rotation (2.2.7): +0.15° to −0.15°, determined on solution S.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 50 mg of the substance to be examined in *hexane R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of the substance to be examined and 50 mg of *bornyl acetate R* in *hexane R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with *hexane R*.

The chromatographic procedure may be carried out using:

- a column 2 m long and 2 mm in internal diameter packed with *diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *macrogol 20 000 R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 130 °C and that of the injection port and the detector at 200 °C.

Inject 1 µl of each solution and adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with the test solution is about 80 per cent of the full scale of the recorder. Record the chromatograms for three times the retention time of camphor.

The test is not valid unless in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to camphor and bornyl acetate is not less than 1.5; in the chromatogram obtained with reference solution (b), the principal peak has a signal-to-noise ratio of at least 5. In the chromatogram obtained with the test solution: the sum of the areas of the peaks, apart from the principal peak, is not greater than 4 per cent of the area of the principal peak; none of the peaks, apart from the principal peak, has an area greater than 2 per cent of the area of the principal peak. Disregard any peak with an area less than that of the peak in the chromatogram obtained with reference solution (b).

Halogens. Dissolve 1.0 g in 10 ml of *2-propanol R* in a distillation flask. Add 1.5 ml of *dilute sodium hydroxide solution R* and 50 mg of *nickel-aluminium alloy R*. Heat on a water-bath until the *2-propanol R* has evaporated. Allow to cool and add 5 ml of *water R*. Mix and filter through a wet filter previously washed with *water R* until free from chlorides. Dilute the filtrate to 10.0 ml with *water R*. To 5.0 ml of the solution, add *nitric acid R* dropwise until the precipitate which forms is redissolved and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (2.4.4) (100 ppm).

Water. Dissolve 1 g in 10 ml of *light petroleum R*. The solution is clear (2.2.1).

Residue on evaporation. Evaporate 2.0 g on a water-bath and dry at 100 °C to 105 °C for 1 h. The residue weighs not more than 1 mg (0.05 per cent).

01/2005:1401

CAPRYLIC ACID

Acidum caprylicum

C₈H₁₆O₂M_r 144.2

DEFINITION

Caprylic acid contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of octanoic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A clear, colourless or slightly yellowish, oily liquid, very slightly soluble in water, very soluble in acetone and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

- A. It complies with the test for relative density (see Tests).
 B. Examine the chromatograms obtained in the test for related substances. The retention time and size of the principal peak in the chromatogram obtained with the test solution are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, Method II).

Relative density (2.2.5): 0.909 to 0.912.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 0.10 g of the substance to be examined in *ethyl acetate R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 0.10 g of *caprylic acid CRS* in *ethyl acetate R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *ethyl acetate R*. Dilute 5.0 ml of the solution to 50.0 ml with *ethyl acetate R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 30 m long and 0.25 mm in internal diameter coated with *macrogol 20 000 2-nitroterephthalate R* (film thickness 0.25 µm),
- *helium for chromatography R* as the carrier gas at a flow rate of 1.5 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 1	100	–	isothermal
	1 - 25	100 → 220	5	linear gradient
	25 - 35	220	–	isothermal
Injection port		250		
Detector		250		

Inject 1 µl of reference solution (b). The test is not valid unless in the chromatogram obtained the principal peak has a signal-to-noise ratio of at least 5.

Inject 1 µl of the test solution and 1 µl of reference solution (a). Calculate the percentage content of related substances from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, disregarding any peaks with an area less than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b). The content of any related substance is not greater than 0.3 per cent and the sum of the contents is not greater than 0.5 per cent.

Heavy metals (2.4.8). Dissolve 2.0 g in *alcohol R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test B for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R* and 9 ml of *alcohol R*.

Water (2.5.12). Not more than 0.7 per cent, determined on 1.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.125 g in 25 ml of *alcohol R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 14.42 mg of C₈H₁₆O₂.

IMPURITIES

- A. $n = 4$: hexanoic acid,
 B. $n = 5$: heptanoic acid,
 C. $n = 7$: nonanoic acid,
 D. $n = 8$: decanoic acid,
 E. valproic acid,

- F. R = OCH₃, $n = 6$: methyl octanoate,
 G. R = OC₂H₅, $n = 6$: ethyl octanoate,
 H. R = OCH₃, $n = 8$: methyl decanoate,
 I. R = CH₃, $n = 8$: undecan-2-one,

- J. 5-butyltetrahydrofuran-2-one (γ-hydroxyoctanoic acid lactone).

01/2005:1184

CAPRYLOCAPROYL
MACROGOLGLYCERIDES

Macrogolglyceridorum caprylocaprates

DEFINITION

Caprylocaproyl macrogolglycerides are mixtures of monoesters, diesters and triesters of glycerol and monoesters and diesters of macrogols with a mean relative molecular mass between 200 and 400. They are obtained by partial alcoholysis of medium-chain triglycerides using macrogol or by esterification of glycerol and macrogol with caprylic acid and capric acid or a mixture of glycerol esters and condensates of ethylene oxide with caprylic acid (octanoic acid) and capric acid (decanoic acid). They may contain free macrogols.

CHARACTERS

Pale-yellow oily liquids, dispersible in hot water, freely soluble in methylene chloride.

The relative density at 20 °C is about 1.0, the refractive index at 20 °C is about 1.4.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 ml with the same solvent.

Apply to the plate 50 µl of the test solution. Develop over a path of 15 cm using a mixture of 30 volumes of *hexane R* and 70 volumes of *ether R*. Allow the plate to dry in air. Spray with a 0.1 g/l solution of *rhodamine B R* in *alcohol R* and examine in ultraviolet light at 365 nm. The chromatogram shows a spot corresponding to triglycerides with an R_f value of about 0.9 (R_{st} 1) and spots corresponding to 1,3-diglycerides (R_{st} 0.7), to 1,2-diglycerides (R_{st} 0.6), to monoglycerides (R_{st} 0.1) and to esters of macrogol (R_{st} 0).

- B. They comply with the test for hydroxyl value (see Tests).
C. They comply with the test for saponification value (see Tests).
D. They comply with the test for fatty acid composition (see Tests).

TESTS

Viscosity (2.2.9). The ranges are presented in Table 1184.-1, determined at 20 ± 0.5 °C.

Table 1184.-1

Ethylene oxide units per molecule (nominal value)	Type of macrogol	Viscosity (mPa.s)
4	200	30 to 50
6	300	60 to 80
8	400	80 to 110

Acid value (2.5.1). Not more than 2.0, determined on 2.0 g.

Hydroxyl value (2.5.3, *Method A*). The ranges are presented in Table 1184.-2, determined on 1.0 g.

Table 1184.-2

Ethylene oxide units per molecule (nominal value)	Type of macrogol	Hydroxyl value
4	200	80 to 120
6	300	140 to 180
8	400	170 to 205

Peroxide value (2.5.5). Not more than 6.0, determined on 2.0 g.

Saponification value (2.5.6). The ranges are presented in Table 1184.-3, determined on 2.0 g.

Table 1184.-3

Ethylene oxide units per molecule (nominal value)	Type of macrogol	Saponification value
4	200	265 to 285
6	300	170 to 190
8	400	85 to 105

Alkaline impurities. Introduce into a test-tube 5.0 g and carefully add a mixture, neutralised if necessary with 0.01 M *hydrochloric acid* or with 0.01 M *sodium hydroxide*, of 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *alcohol R*, 0.3 ml of *water R* and 10 ml of *alcohol R*. Shake and allow to stand. Not more than 1.0 ml of 0.01 M *hydrochloric acid* is required to change the colour of the upper layer to yellow.

Free glycerol. Not more than 5.0 per cent. Dissolve 1.20 g in 25.0 ml of *methylene chloride R*. Heat if necessary. After cooling, add 100 ml of *water R*. Shake and add 25.0 ml of a 6 g/l solution of *periodic acid R*. Shake and allow to stand for 30 min. Add 40 ml of a 75 g/l solution of *potassium iodide R*. Allow to stand for 1 min. Add 1 ml of *starch solution R*. Titrate the iodine with 0.1 M *sodium thiosulphate*. Carry out a blank titration.

1 ml of 0.1 M *sodium thiosulphate* is equivalent to 2.3 mg of glycerol.

Fatty acid composition (2.4.22, *Method A*). The fatty acid fraction has the following composition:

- *caproic acid*: not more than 2.0 per cent,
- *caprylic acid*: 50.0 per cent to 80.0 per cent,
- *capric acid*: 20.0 per cent to 50.0 per cent,
- *lauric acid*: not more than 3.0 per cent,
- *myristic acid*: not more than 1.0 per cent.

Ethylene oxide and dioxan (2.4.25). Not more than 1 ppm of ethylene oxide and not more than 10 ppm of dioxan.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Water (2.5.12). Not more than 1.0 per cent, determined on 1.0 g by the semi-micro determination of water. Use a mixture of 30 volumes of *anhydrous methanol R* and 70 volumes of *methylene chloride R* as solvent.

Total ash (2.4.16). Not more than 0.1 per cent, determined on 1.0 g.

LABELLING

The label states the type of macrogol used (mean relative molecular mass) or the number of ethylene oxide units per molecule (nominal value).

01/2005:1859

CAPSICUM

Capsici fructus

DEFINITION

Dried ripe fruits of *Capsicum annum* L. var. *minimum* (Miller) Heiser and small-fruited varieties of *Capsicum frutescens* L.

Content: minimum 0.4 per cent of total capsaicinoids expressed as capsaicin ($C_{18}H_{27}NO_3$; M_r 305.4) (dried drug).

CHARACTERS

Extremely pungent taste.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The fruit is yellowish-orange to reddish-brown, oblong conical with an obtuse apex, about 1 cm to 3 cm long and up to 1 cm in diameter at the widest part, occasionally attached to a 5-toothed inferior calyx and a straight pedicel. Pericarp somewhat shrivelled, glabrous, enclosing about 10 to 20 flat, reniform seeds 3 mm to 4 mm long, either loose or attached to a reddish dissepiment.
- B. Reduce to a powder (355). The powder is orange. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the pericarp having an outer epicarp with cells often arranged in rows of 5 to

7, cuticle uniformly striated; parenchymatous cells frequently containing droplets of red oil, occasionally containing microspenoidal crystals of calcium oxalate; endocarp with characteristic island groups of sclerenchymatous cells, the groups being separated by thin-walled parenchymatous cells. Fragments of the seeds having an epispem composed of large, greenish-yellow, sinuous-walled sclereids with thin outer walls and strongly and unevenly thickened radial and inner walls which are conspicuously pitted; endosperm parenchymatous cells with drops of fixed oil and aleurone grains 3 µm to 6 µm in diameter. Occasional fragments from the calyx having an outer epidermis with anisocytic stomata (2.8.3), inner epidermis with many trichomes but no stomata; trichomes glandular, with uniseriate stalks and multicellular heads; mesophyll with many idioblasts containing microspenoidal crystals of calcium oxalate.

C. Thin-layer chromatography (2.2.27).

Test solution. To 0.50 g of the powdered drug (500) add 5.0 ml of *ether R*, shake for 5 min and filter.

Reference solution. Dissolve 2 mg of *capsaicin R* and 2 mg of *dihydrocapsaicin R* in 5.0 ml of *ether R*.

Plate: TLC octadecylsilyl silica gel plate *R*.

Mobile phase: water *R*, methanol *R* (20:80 V/V).

Application: 20 µl, as bands.

Development: over a path of 12 cm.

Drying: in air.

Detection: spray with a 5 g/l solution of *dichloroquinonechlorimide R* in *methanol R*.

Expose the plate to ammonia vapour until blue zones appear. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
_____	_____
Capsaicin: a blue zone	A blue zone (capsaicin)
Dihydrocapsaicin: a blue zone	A blue zone (dihydrocapsaicin)
_____	_____
Reference solution	Test solution

TESTS

Nonivamide. Liquid chromatography (2.2.29).

Test solution. To 2.5 g of the powdered drug (500) add 100 ml of *methanol R*. Allow to macerate for 30 min.

Figure 1859-1. – Chromatogram for the test for nonivamide and the assay of capsaicin

Place in an ultrasonic bath for 15 min. Filter into a 100 ml volumetric flask, rinse the flask and filter with *methanol R*. Dilute to 100.0 ml with *methanol R*.

Reference solution. Dissolve 20.0 mg of *capsaicin R* and 4.0 mg of *nonivamide R* in 100.0 ml of *methanol R*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: phenylsilyl silica gel for chromatography *R* (5 µm),
- temperature: 30 °C.

Mobile phase: mixture of 40 volumes of *acetonitrile R* and 60 volumes of a 1 g/l solution of *phosphoric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 225 nm.

Injection: 10 µl.

Elution order: elution order similar to that obtained in Figure 1859-1.

System suitability: reference solution:

- resolution: minimum 3.0 between the peaks due to capsaicin and nonivamide.

Limit: calculate the percentage content of nonivamide from the expression:

$$\frac{F_1 \times m_2 \times p_1}{F_2 \times m_1}$$

F_1 = area of the peak corresponding to nonivamide in the chromatogram obtained with the test solution,

F_2 = area of the peak corresponding to nonivamide in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined in grams,

m_2 = mass of nonivamide used to prepare the reference solution in grams,

p_1 = percentage content of nonivamide in the reagent.

- *nonivamide*: maximum 5.0 per cent of the total capsaicinoid content.

Foreign matter (2.8.2): maximum 2 per cent *m/m*. Fruits of *C. annuum* L. var. *longum* (Sendtn.) are absent.

Loss on drying (2.2.32): maximum 11.0 per cent, determined on 1.000 g of the powdered drug (500) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 10.0 per cent.

ASSAY

Liquid chromatography (2.2.29) as described in the test for nonivamide.

Calculate the percentage content of capsaicinoids from the expression:

$$\frac{(F_3 + F_5 + F_6) \times m_4 \times p_2}{F_4 \times m_3}$$

- F_3 = area of the peak corresponding to capsaicin in the chromatogram obtained with the test solution,
 F_4 = area of the peak corresponding to capsaicin in the chromatogram obtained with the reference solution,
 F_5 = area of the peak corresponding to dihydrocapsaicin in the chromatogram obtained with the test solution,
 F_6 = area of the peak corresponding to nordihydrocapsaicin in the chromatogram obtained with the test solution,
 m_3 = mass of the drug to be examined in grams,
 m_4 = mass of capsaicin used to prepare the reference solution in grams,
 p_2 = percentage content of capsaicin in the reagent.

01/2005:1079

CAPTOPRIL

Captoprilum

 $C_9H_{15}NO_3S$ M_r 217.3

DEFINITION

(2S)-1-[(2S)-2-Methyl-3-sulphanylpropanoyl]pyrrolidine-2-carboxylic acid.

Content: 98.0 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white crystalline powder.

Solubility: freely soluble in water, in methylene chloride and in methanol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: captopril CRS.

TESTS

Solution S. Dissolve 0.5 g in carbon dioxide-free water R and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3): 2.0 to 2.6 for solution S.

Specific optical rotation (2.2.7): -127 to -132 (dried substance).

Dissolve 0.250 g in ethanol R and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of the substance to be examined in the mobile phase, add 1 ml of 0.05 M iodine and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Column:

- size: $l = 0.125$ m, $\varnothing = 4$ mm,
- stationary phase: octylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: phosphoric acid R, methanol R, water R (0.05:50:50 V/V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 μ l.

Run time: 3 times the retention time of captopril.

System suitability: reference solution (b):

- the chromatogram shows 3 peaks,
- resolution: minimum of 2.0 between the last 2 eluting principal peaks,

Limits:

- any impurity: not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- total: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent),
- disregard limit: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Disregard any peak with a retention time less than 1.4 min.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying under high vacuum at 60 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 30 ml of water R. Titrate with 0.05 M iodine, determining the end-point potentiometrically (2.2.20). Use a combined platinum electrode.

1 ml of 0.05 M iodine is equivalent to 21.73 mg of $C_9H_{15}NO_3S$.

STORAGE

In an airtight container.

IMPURITIES

A. (2S,2'S)-1,1'-[disulphanediylbis[(2S)-2-methyl-1-oxopropane-3,1-diyl]-bis[pyrrolidine-2-carboxylic] acid (captopril-disulphide).

01/2005:1080

CARAWAY FRUIT

Carvi fructus

DEFINITION

Caraway fruit consists of the whole, dry mericarp of *Carum carvi* L. It contains not less than 30 ml/kg of essential oil, calculated with reference to the anhydrous drug.

CHARACTERS

Caraway fruit has an odour reminiscent of carvone.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The fruit is a cremocarp of almost cylindrical shape. It is generally 3 mm to 6.5 mm long and 1 mm to 1.5 mm wide. The mericarps, usually free, are greyish-brown to brown, glabrous, mostly sickle-shaped, with both ends sharply terminated. Each bears five prominent narrow ridges. When cut transversely the profile shows an almost regular pentagon and four vittae on the dorsal surface and two on the commissural surface may be seen with a lens.

B. Reduce to a powder (355). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the secretory cells composed of yellowish-brown to brown, thin-walled, polygonal secretory cells, frequently associated with a layer of thin-walled transversely elongated cells, 8-12 µm wide; fragments of the epicarp with thick-walled cells and occasional anomocytic stomata (2.8.3); numerous endosperm fragments containing aleurone grains, droplets of fatty oil and microcrystals of calcium oxalate in rosette formation; spiral vessels accompanied by sclerenchymatous fibres; rarely some fibre bundles from the carpophore; groups of rectangular to sub-rectangular sclereids from the mesocarp with moderately thickened and pitted walls may be present.

C. Examine by thin-layer chromatography (2.2.27) using a suitable silica gel as the coating substance.

Test solution. Shake 0.5 g of the powdered drug (710) with 5.0 ml of *ethyl acetate R* for 2 min to 3 min. Filter over 2 g of *anhydrous sodium sulphate R*. Use the filtrate as the test solution.

Reference solution. Dissolve 2 µl of *carvone R* and 5 µl of *olive oil R* in 1.0 ml of *ethyl acetate R*.

Apply to the plate as bands 20 µl of the test solution and 10 µl of the reference solution. Develop over a path of 10 cm using a mixture of 5 volumes of *ethyl acetate R* and 95 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatograms of the test solution and of the reference solution show a quenching zone (carvone) in the central part against a light background. Spray with *anisaldehyde solution R* and heat under observation at 100 °C to 105 °C for 2 to 4 min. Examine in daylight. The zones corresponding to carvone appear strong orange-brown. The chromatogram obtained with the test solution shows above the zone corresponding to carvone a violet zone corresponding to triglycerides similar in position and colour to the zone in the chromatogram obtained with the reference solution (triglycerides of olive oil). The chromatogram obtained with the test solution shows close

to the solvent front a weak violet zone corresponding to terpene hydrocarbons and in the lower part some weak, mostly violet-greyish and brownish zones.

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter.

Water (2.2.13). Not more than 100 ml/kg, determined on 10.0 g of powdered drug by distillation.

Total ash (2.4.16). Not more than 7.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Reduce the drug to a powder (710) and immediately use 10.0 g for the determination. Distil at a rate of 2-3 ml/min for 90 min.

STORAGE

Store protected from light.

01/2005:1971

CARBACHOL

Carbacholum

C₆H₁₅ClN₂O₂M_r 182.7

DEFINITION

2-(Carbamoyloxy)-N,N,N-trimethylethanaminium chloride.

Content: 99.0 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline, hygroscopic powder.

Solubility: very soluble in water, sparingly soluble in alcohol, practically insoluble in acetone.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *carbachol CRS*.

B. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. 0.5 ml of solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 2.0 ml of solution S, add 0.05 ml of *methyl red mixed solution R*. Not more than 0.2 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Thin-layer chromatography (2.2.27).

01/2005:0543

Prepare the solutions immediately before use.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 5.0 ml with the same solvent.

Test solution (b). Dilute 2.0 ml of test solution (a) to 20.0 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *carbachol CRS* in *methanol R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 8 mg of *choline chloride R* and 8 mg of *acetylcholine chloride CRS* in *methanol R* and dilute to 10.0 ml with the same solvent. Dilute 5.0 ml to 10.0 ml with *methanol R*.

Plate: *cellulose for chromatography R* as the coating substance.

Mobile phase: *water R*, *methanol R* (10:90 V/V).

Application: 10 µl.

Development: over 2/3 of the plate.

Detection: spray with *potassium iodobismuthate solution R3*.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Limits: in the chromatogram obtained with test solution (a):

- **any impurity:** any spot, apart from the principal spot, is not more intense than one or other of the 2 principal spots in the chromatogram obtained with reference solution (b) (1 per cent). Compare the spots with the spot of the most appropriate colour in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g of the residue obtained in the test for loss on drying.

ASSAY

Dissolve 0.150 g in a mixture of 10 ml of *anhydrous acetic acid R* and 40 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*. Determine the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 18.27 mg of $C_{15}H_{12}N_2O_2$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. 2-hydroxy-*N,N,N*-trimethylethanaminium chloride (*choline chloride*).

CARBAMAZEPINE

Carbamazepinum

 $C_{15}H_{12}N_2O$
 M_r 236.3

DEFINITION

5*H*-dibenzo[*b,f*]azepine-5-carboxamide.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white crystalline powder.

Solubility: very slightly soluble in water, freely soluble in methylene chloride, sparingly soluble in acetone and in alcohol.

It shows polymorphism; the acceptable crystalline form corresponds to *carbamazepine CRS*.

IDENTIFICATION

A. Melting point (2.2.14): 189 °C to 193 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *carbamazepine CRS*.

Preparation: examine the substances as discs without prior treatment.

TESTS

Acidity or alkalinity. To 1.0 g add 20 ml of *carbon dioxide-free water R*, shake for 15 min and filter. To 10 ml of the filtrate add 0.05 ml of *phenolphthalein solution R1* and 0.5 ml of 0.01 M *sodium hydroxide*; the solution is red. Add 1.0 ml of 0.01 M *hydrochloric acid*; the solution is colourless. Add 0.15 ml of *methyl red solution R*; the solution is red.

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 0.150 g of the substance to be examined in *methanol R2* and dilute to 50.0 ml with the same solvent. Sonicate. Dilute 10.0 ml of this solution to 20.0 ml with *water R*.

Test solution (b). Dilute 10.0 ml of test solution (a) to 50.0 ml with a mixture of equal volumes of *methanol R2* and *water R*.

Reference solution (a). Dissolve 7.5 mg of *carbamazepine CRS*, 7.5 mg of *carbamazepine impurity A CRS* and 7.5 mg of *iminodibenzyl R* (impurity E) in *methanol R2* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 50.0 ml with a mixture of equal volumes of *methanol R2* and *water R*.

Reference solution (b). Dissolve 0.150 g of *carbamazepine CRS* in *methanol R2* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of this solution to 50.0 ml with a mixture of equal volumes of *methanol R2* and *water R*.

Column:

– size: $l = 0.25$ m, $\varnothing = 4.6$ mm,

– stationary phase: *nitrile silica gel for chromatography R1* (10 µm).

Mobile phase: tetrahydrofuran *R*, methanol *R2*, water *R* (3:12:85 *V/V/V*). To 1000 ml of this solution add 0.2 ml of anhydrous formic acid *R* and 0.5 ml of triethylamine *R*.

Flow rate: 2.0 ml/min.

Detection: a spectrophotometer at 230 nm.

Injection: 20 µl; inject test solution (a) and reference solution (a).

Run time: 6 times the retention time of carbamazepine which is about 10 min.

Relative retention with reference to carbamazepine: impurity B = about 0.7; impurity A = about 0.9; impurity C = about 1.6; impurity D = about 3.5; impurity E = about 5.1.

System suitability:

- **resolution:** minimum of 1.7 between the peaks due to carbamazepine and impurity A in the chromatogram obtained with reference solution (a).

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **impurity E:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **any other impurity:** not more than the area of the peak due to carbamazepine in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 5 times the area of the peak due to carbamazepine in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.5 times the area of the peak due to carbamazepine in the chromatogram obtained with reference solution (a) (0.05 per cent).

Chlorides (2.4.4): maximum 140 ppm.

Suspend 0.715 g in 20 ml of water *R* and boil for 10 min. Cool and dilute to 20 ml with water *R*. Filter through a membrane filter (nominal pore size: 0.8 µm). Dilute 10 ml of the filtrate to 15 ml with water *R*. This solution complies with the limit test for chlorides.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: test solution (b) and reference solution (b).

System suitability:

- **repeatability:** reference solution (b).

Calculate the percentage content *m/m* of dried substance.

STORAGE

In an airtight container.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F

A. R = CO-NH₂: 10,11-dihydro-5*H*-dibenzo[*b,f*]azepine-5-carboxamide (10,11-dihydrocarbamazepine),

E. R = H: 10,11-dihydro-5*H*-dibenzo[*b,f*]azepine (iminodibenzyl),

B. 9-methylacridine,

C. R = CO-NH-CO-NH₂: (5*H*-dibenzo[*b,f*]azepin-5-ylcarbonyl)urea (*N*-carbamoylcarbamazepine),

D. R = H: 5*H*-dibenzo[*b,f*]azepine (iminostilbene),

F. R = CO-Cl: 5*H*-dibenzo[*b,f*]azepine-5-carbonyl chloride (5-chlorocarbonyliminostilbene).

01/2005:1185

CARBASALATE CALCIUM

Carbasalatium calcicum

C₁₉H₁₈CaN₂O₉

M_r 458.4

DEFINITION

Carbasalate calcium contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of an equimolecular compound of calcium di[2-(acetyloxy)benzoate] and urea, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, freely soluble in water and dimethylformamide, practically insoluble in acetone and in anhydrous methanol.

Protect the substance from moisture during handling. Examination in aqueous solutions has to be performed immediately after preparation.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Dissolve 0.250 g in *water R* and dilute to 100.0 ml with the same solvent. To 1.0 ml of the solution add 75 ml of *water R* and 5 ml of *dilute hydrochloric acid R*, mix and dilute with *water R* to 100.0 ml. Examined immediately after preparation between 220 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 228 nm and 276 nm. The specific absorbances at the maxima are 363 to 379 and 49 to 53, respectively.
- B. Examine by infrared spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of carbasalate calcium*.
- C. Dissolve 0.1 g in 10 ml of *water R*, boil for 2 min and cool. The solution gives reaction (a) of salicylates (2.3.1).
- D. Heat 0.2 g with 0.2 g of *sodium hydroxide R*; a yellow to yellowish-brown colour is produced and the vapour turns *red litmus paper R* blue.
- E. It gives reaction (a) of calcium (2.3.1).

TESTS

Appearance of solution. Dissolve 2.5 g in 50 ml of *water R*. The solution is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, *Method II*).

Related substances. In a 100 ml volumetric flask, dissolve 0.150 g in 10 ml of 0.1 M *tetrabutylammonium hydroxide* in 2-propanol. Allow to stand for 10 min shaking occasionally. Add 8.0 ml of 0.1 M *hydrochloric acid* and 20.0 ml of a 19 g/l solution of *disodium tetraborate R* and mix. While swirling continuously, add 2.0 ml of a 10 g/l solution of *aminopyrazolone R* and 2.0 ml of a 10 g/l solution of *potassium ferricyanide R*. Allow to stand for 2 min, dilute to 100.0 ml with *water R*, mix and allow to stand for 20 min. Measure the absorbance (2.2.25) of the solution at the maximum at 505 nm using *water R* as the compensation liquid. The absorbance is not greater than 0.125 (0.1 per cent, expressed as acetylsalicylsalicylic acid).

Salicylic acid. In a 100 ml volumetric flask, dissolve 0.200 g in 80 ml of *water R* and add 10 ml of a 10 g/l solution of *ferric nitrate R* in a 80 g/l solution of *dilute nitric acid R*. Dilute to 100.0 ml with *water R*. Immediately after preparation, measure the absorbance (2.2.25) of the solution at the maximum of 525 nm using *water R* as the compensation liquid. The absorbance is not greater than 0.115 (0.5 per cent, expressed as salicylic acid).

Sodium. Not more than 0.1 per cent, determined by atomic emission spectrometry (2.2.22, *Method I*) using 1.0 g dissolved in 500.0 ml of *water R*.

Heavy metals (2.4.8). Dissolve 2.0 g in 8 ml of *water R*, with heating, cool and add 12 ml of *acetone R*. 12 ml of the solution complies with limit test B for heavy metals (10 ppm). Prepare the standard using 10 ml of *lead standard solution* (1 ppm Pb) *R*.

Water (2.5.12). Not more than 0.1 per cent, determined on 1.000 g by the semi-micro determination of water. Use a mixture of 15 ml of *anhydrous methanol R* and 15 ml of *dimethylformamide R* as the solvent.

ASSAY

In a flask with a ground-glass stopper, dissolve 0.400 g in 25 ml of *water R*. Add 25.0 ml of 0.1 M *sodium hydroxide*. Close the flask and allow to stand for 2 h. Titrate the excess of alkali with 0.1 M *hydrochloric acid*, using 0.2 ml of *phenolphthalein solution R*. Carry out a blank titration. 1 ml of 0.1 M *sodium hydroxide* is equivalent to 22.92 mg of $C_{10}H_{14}N_2O_4 \cdot H_2O$.

STORAGE

Store in an airtight container.

IMPURITIES

- A. 2-(acetyloxy)benzoic anhydride,

- B. 2-[[2-(acetyloxy)benzoyl]oxy]benzoic acid (acetylsalicylsalicylic acid),

- C. 2-hydroxybenzoic acid (salicylic acid).

corrected

CARBIDOPA

Carbidopum

$C_{10}H_{14}N_2O_4 \cdot H_2O$

M_r 244.2

DEFINITION

Carbidopa contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2S)-3-(3,4-dihydroxyphenyl)-2-hydrazino-2-methylpropanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, slightly soluble in water, very slightly soluble in alcohol, practically insoluble in methylene chloride. It dissolves in dilute solutions of mineral acids.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Dissolve 50.0 mg in a 8.5 g/l solution of *hydrochloric acid R* in *methanol R* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of this solution to 100.0 ml with a 8.5 g/l solution of *hydrochloric acid R* in *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 283 nm. The specific absorbance at the maximum is 135 to 150, calculated with reference to the dried substance.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *carbidopa CRS*. Examine the substances prepared as discs.

- D. Shake vigorously about 5 mg with 10 ml of *water R* for 1 min and add 0.3 ml of *ferric chloride solution R2*. An intense green colour is produced, which quickly turns to reddish-brown.
- E. Suspend about 20 mg in 5 ml of *water R* and add 5 ml of *cupri-tartaric solution R*. On heating, the colour of the solution changes to dark brown and a red precipitate is formed.

TESTS

Appearance of solution. Dissolve 0.25 g in 25 ml of 1 M *hydrochloric acid*. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ or B₆ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). With the aid of an ultrasonic bath, dissolve completely 0.250 g in *aluminium chloride solution R* and dilute to 25.0 ml with the same solution. The specific optical rotation is -22.5 to -26.5 , calculated with reference to the dried substance.

Hydrazine. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution (a). Dissolve 0.50 g in *dilute hydrochloric acid R* and dilute to 2.0 ml with the same acid.

Test solution (b). Place 25 g of *strongly basic anion exchange resin R* into each of two conical flasks with ground-glass stoppers. To each, add 150 ml of *carbon dioxide-free water R* and shake from time to time during 30 min. Decant the liquid from both flasks and repeat the process with further quantities, each of 150 ml, of *carbon dioxide-free water R*.

Take two 100 ml measuring cylinders 3.5 cm to 4.5 cm in internal diameter and label these A and B. Into cylinder A, transfer as completely as possible the resin from one conical flask using 60 ml of *carbon dioxide-free water R*; into cylinder B, transfer the second quantity of resin, this time using 20 ml of *carbon dioxide-free water R*.

Into each cylinder, insert a gas-inlet tube, the end of which has an internal diameter of 2 mm to 3 mm and which reaches almost to the bottom of the cylinder. Pass a rapid stream of *nitrogen for chromatography R* through each mixture so that homogeneous suspensions are formed. After 30 min, without interrupting the gas flow, add 1.0 ml of test solution (a) to cylinder A; after 1 min stop the gas flow into cylinder A and transfer the contents, through a moistened filter paper, into cylinder B. After 1 min, stop the gas flow to cylinder B and pour the solution immediately through a moistened filter paper into a freshly prepared mixture of 1 ml of a 200 g/l solution of *salicylaldehyde R* in *methanol R* and 20 ml of *phosphate buffer solution pH 5.5 R* in a conical flask, shake thoroughly for 1 min and heat in a water-bath at 60 °C for 15 min. The liquid becomes clear. Allow to cool, add 2.0 ml of *toluene R* and shake vigorously for 2 min. Transfer the mixture into a centrifuge tube and centrifuge.

Separate the toluene layer in a 100 ml separating funnel and shake vigorously with two quantities, each of 20 ml, of a 200 g/l solution of *sodium metabisulphite R* and finally with two quantities, each of 50 ml, of *water R*. Separate the toluene layer.

Reference solution (a). Dissolve 10 mg of *hydrazine sulphate R* in *dilute hydrochloric acid R* and dilute to 50 ml with the same acid. Dilute 1.0 ml of this solution to 10.0 ml with *dilute hydrochloric acid R*.

Reference solution (b). Prepare the solution at the same time and in the same manner as described for test solution (b) using 1.0 ml of reference solution (a) in place of 1.0 ml of test solution (a).

Apply separately to the plate 10 µl of test solution (b) and 10 µl of reference solution (b). Develop over a path of 10 cm using a mixture of 1 volume of *water R* and 2 volumes of *methanol R*. Allow the plate to dry in air. Examine in ultraviolet light at 365 nm. Any spot in the chromatogram obtained with test solution (b) showing a yellow fluorescence is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (20 ppm of hydrazine).

Methyldopa and methylcarbidopa. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in 0.1 M *hydrochloric acid* and dilute to 10.0 ml with the same acid.

Reference solution (a). Dissolve the contents of a vial of *methylcarbidopa CRS* in 0.1 M *hydrochloric acid*, add 1 mg of *methyldopa CRS* and dilute to 20.0 ml with the same acid.

Reference solution (b). Dissolve 5 mg of *carbidopa CRS* and 5 mg of *methyldopa CRS* in 0.1 M *hydrochloric acid* and dilute to 10.0 ml with the same acid.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 2 volumes of *methanol R* and 98 volumes of a 14 g/l solution of *potassium dihydrogen phosphate R*,
- as detector a spectrophotometer set at 282 nm,
- a loop injector.

Inject 20 µl of each solution. The test is not valid unless the resolution between the peaks corresponding to methyldopa and carbidopa in the chromatogram obtained with reference solution (b) is greater than 4.0. In the chromatogram obtained with the test solution, the areas of any peaks corresponding to methyldopa and methylcarbidopa are not greater than the areas of the corresponding peaks in the chromatogram obtained with reference solution (a) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): 6.9 per cent to 7.9 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g with gentle heating in 75 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 22.62 mg of C₁₀H₁₄N₂O₄.

STORAGE

Store protected from light.

01/2005:0884

CARBIMAZOLE**Carbimazolum** $C_7H_{10}N_2O_2S$ M_r 186.2**DEFINITION**

Ethyl 3-methyl-2-thioxo-2,3-dihydro-1H-imidazole-1-carboxylate.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish-white, crystalline powder.

Solubility: slightly soluble in water, soluble in acetone and in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (2.2.14): 122 °C to 125 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: carbimazole CRS.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of carbimazole CRS in *methylene chloride R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel GF₂₅₄ plate R.

Mobile phase: acetone R, *methylene chloride R* (20:80 V/V).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air for 30 min.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 10 mg in a mixture of 50 ml of *water R* and 0.05 ml of *dilute hydrochloric acid R*. Add 1 ml of *potassium iodobismuthate solution R*. A red precipitate is formed.

TESTS

Impurity A and other related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 5.0 mg of the substance to be examined in 10.0 ml of a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Use this solution within 5 min of preparation.

Reference solution (a). Dissolve 5 mg of *thiamazole R* and 0.10 g of carbimazole CRS in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Reference solution (b). Dissolve 5.0 mg of *thiamazole R* in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 10.0 ml with the same mixture of solvents. Dilute 1.0 ml of this solution to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Column:

- *size:* $l = 0.15$ m, $\varnothing = 3.9$ mm,
- *stationary phase:* octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: *acetonitrile R*, *water R* (10:90 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 µl.

Run time: 1.5 times the retention time of carbimazole.

Retention time: carbimazole = about 6 min.

System suitability: reference solution (a):

- *resolution:* minimum 5.0 between the peaks due to impurity A and carbimazole.

Limits:

- *impurity A:* not more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *any other impurity:* not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 24 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 50.0 mg in *water R* and dilute to 500.0 ml with the same solvent. To 10.0 ml add 10 ml of *dilute hydrochloric acid R* and dilute to 100.0 ml with *water R*. Measure the absorbance (2.2.25) at the maximum at 291 nm. Calculate the content of $C_7H_{10}N_2O_2S$ taking the specific absorbance to be 557.

IMPURITIES

A. 1-methyl-1H-imidazole-2-thiol (thiamazole).

01/2005:0885

CARBOCISTEINE**Carbocisteinum** $C_5H_9NO_4S$ M_r 179.2**DEFINITION**

Carbocisteine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2R)-2-amino-3-[(carboxymethyl)sulphonyl]propanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, practically insoluble in water and in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *carbocisteine CRS*. Examine the substances prepared as discs.
- C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve 0.1 g in 4.5 ml of *dilute sodium hydroxide solution R*. Heat on a water-bath for 10 min. Cool and add 1 ml of a 25 g/l solution of *sodium nitroprusside R*. A dark red colour is produced, which changes to brown and then to yellow within a few minutes.

TESTS

Solution S. Disperse 5.00 g in 20 ml of *water R* and add dropwise with shaking 2.5 ml of *strong sodium hydroxide solution R*. Adjust to pH 6.3 with *1 M sodium hydroxide* and dilute to 50.0 ml with *water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Shake 0.2 g with 20 ml of *carbon dioxide-free water R*. The pH of the suspension is 2.8 to 3.0.

Specific optical rotation (2.2.7): –32.5 to –35.5, determined on solution S and calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dilute ammonia R2* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *carbocisteine CRS* in *dilute ammonia R2* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *carbocisteine CRS* and 10 mg of *arginine hydrochloride CRS* in 5 ml of *dilute ammonia R2* and dilute to 25 ml with *water R*.

Apply separately to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Dry the plate in a current of warm air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Chlorides (2.4.4). Dissolve 33 mg in 5 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution, without further addition of nitric acid, complies with the limit test for chlorides (0.15 per cent).

Sulphates (2.4.13). Dissolve 0.5 g in 5 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.3 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 10 ml of *anhydrous formic acid R* with slight heating and shake until dissolution is complete. Add 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of *0.1 M perchloric acid* is equivalent to 17.92 mg of $C_5H_9NO_4S$.

STORAGE

Store protected from light.

01/2005:1299

CARBOMERS

Carbomera

DEFINITION

High molecular mass polymers of acrylic acid cross-linked with polyalkenyl ethers of sugars or polyalcohols.

Content: 56.0 per cent to 68.0 per cent of carboxylic acid (–COOH) groups (dried substance).

CHARACTERS

Appearance: white, fluffy powder, hygroscopic.

Solubility: swells in water and in other polar solvents after dispersion and neutralisation with sodium hydroxide solution.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Main bands: at 2960 cm^{-1} , 1720 cm^{-1} , 1455 cm^{-1} , 1415 cm^{-1} , 1250 cm^{-1} , 1175 cm^{-1} and 800 cm^{-1} , with the strongest band at 1720 cm^{-1} .

B. Adjust a 10 g/l dispersion to about pH 7.5 with *1 M sodium hydroxide*. A highly viscous gel is formed.

C. Add 2 ml of a 100 g/l solution of *calcium chloride R* with continuous stirring to 10 ml of the gel from test B. A white precipitate is immediately produced.

D. Add 0.5 ml of *thymol blue solution R* to 10 ml of a 10 g/l dispersion. An orange colour is produced. Add 0.5 ml of *cresol red solution R* to 10 ml of a 10 g/l dispersion. A yellow colour is produced.

E. It complies with the apparent nominal viscosity indicated on the label.

TESTS

Apparent viscosity: the nominal apparent viscosity is in the range 300 mPa.s to 115 000 mPa.s. For a product with a nominal apparent viscosity of 20 000 mPa.s or greater, the apparent viscosity is 70.0 per cent to 130.0 per cent of the value stated on the label; for a product with a nominal apparent viscosity less than 20 000 mPa.s, the apparent viscosity is 50.0 per cent to 150.0 per cent of the value stated on the label.

Dry the substance to be examined *in vacuo* at 80 °C for 1 h. Carefully add 2.50 g of the previously dried substance to be examined to 500 ml of *water R* in a 1000 ml beaker while stirring continuously at 1000 ± 50 r/min, with the stirrer shaft set at an angle of 60° to one side of the beaker. Add the previously dried substance over a period of 45-90 s, at a uniform rate, ensuring that loose aggregates of powder are broken up and continue stirring at 1000 ± 50 r/min for 15 min. Remove the stirrer, and place the beaker containing the dispersion in a water-bath at 25 ± 0.2 °C for 30 min. Insert the stirrer to a depth necessary to ensure that air is not drawn into the dispersion, and while stirring at 300 ± 25 r/min, titrate with a glass-calomel electrode system to pH 7.3-7.8 by adding a 180 g/l solution of *sodium hydroxide R* below the surface, determining the end-point potentiometrically (2.2.20). The total volume of the 180 g/l solution of *sodium hydroxide R* used is about 6.2 ml. Allow 2-3 min before the final pH determination. If the final pH exceeds 7.8, discard the preparation, and prepare another using a smaller amount of sodium hydroxide for titration. Return the neutralised preparation to the water-bath at 25 °C for 1 h, then perform the viscosity determination without delay to avoid slight viscosity changes that occur 75 min after neutralisation. Determine the viscosity (2.2.10) with a rotating viscometer with a spindle rotating at 20 r/min, using a spindle suitable for the expected apparent viscosity.

Free acrylic acid. Liquid chromatography (2.2.29).

Test solution. Mix 0.125 g of the substance to be examined with a 25 g/l solution of *aluminium potassium sulphate R* and dilute to 25.0 ml with the same solution. Heat the suspension at 50 °C for 20 min with shaking. Then shake the suspension at room temperature for 60 min. Centrifuge and use the clear supernatant solution as the test solution.

Reference solution. Dissolve 62.5 mg of *acrylic acid R* in a 25 g/l solution of *aluminium potassium sulphate R* and dilute to 100.0 ml with the same solution. Dilute 1.0 ml of this solution to 50.0 ml with a 25 g/l solution of *aluminium potassium sulphate R*.

Column:

- **size:** $l = 0.12$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase:

- **mobile phase A:** a 1.361 g/l solution of *potassium dihydrogen phosphate R*, adjusted to pH 2.5 using *dilute phosphoric acid R*,
- **mobile phase B:** equal volumes of a 1.361 g/l solution of *potassium dihydrogen phosphate R* and *acetonitrile for chromatography R*.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 8	100	0
8 - 9	100 → 0	0 → 100
9 - 20	0	100
20 - 21	0 → 100	100 → 0
21 - 30	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 µl.

Retention time: acrylic acid = about 6.0 min.

Limit:

- **acrylic acid:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.25 per cent).

Benzene. Gas chromatography (2.4.24, *System A*).

Solvent solution. Dissolve 0.100 g of *benzene R* in *dimethyl sulphoxide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 100.0 ml with *water R*.

Test solution. Weigh 50.0 mg of the substance to be examined into an injection vial and add 5.0 ml of *water R* and 1.0 ml of *dimethyl sulphoxide R*.

Reference solution. Weigh 50.0 mg of the substance to be examined into an injection vial and add 4.0 ml of *water R*, 1.0 ml of *dimethyl sulphoxide R* and 1.0 ml of the solvent solution.

Close the vials with a tight rubber membrane stopper coated with polytetrafluoroethylene and secure with an aluminium crimped cap. Shake to obtain a homogeneous dispersion.

Stratic head-space conditions which may be used:

- **equilibration temperature:** 80 °C,
- **equilibration time:** 60 min,
- **transfer line temperature:** 90 °C.

Injection: 1 ml of the gaseous phase of the test solution and 1 ml of the gaseous phase of the reference solution; repeat these injections twice more.

System suitability:

- **repeatability:** maximum relative standard deviation of the differences in area between the analyte peaks obtained from the 3 replicate pair injections of the reference solution and the test solution is 15 per cent.

Limit:

- **benzene:** the mean area of the peak corresponding to benzene in the chromatograms obtained with the test solution is not greater than half the mean area of the peak corresponding to benzene in the chromatograms obtained with the reference solution (2 ppm).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 3.0 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 60 min.

Sulphated ash (2.4.14): maximum 4.0 per cent, determined on 1.0 g.

ASSAY

Slowly add 50 ml of *water R* to 0.120 g whilst stirring and heating at 60 °C for 15 min. Stop heating, add 150 ml of *water R* and continue stirring for 30 min. Add 2 g

of *potassium chloride R* and titrate with 0.2 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.2 M *sodium hydroxide* is equivalent to 9.0 mg of carboxylic acid (-COOH) groups.

STORAGE

In an airtight container.

LABELLING

The label states the nominal apparent viscosity.

01/2005:0375

CARBON DIOXIDE

Carbonei dioxidum

CO₂

M_r 44.01

DEFINITION

Content: minimum 99.5 per cent V/V of CO₂ in the gaseous phase.

This monograph applies to carbon dioxide for medicinal use.

CHARACTERS

Appearance: colourless gas.

Solubility: at 20 °C and at a pressure of 101 kPa, 1 volume dissolves in about 1 volume of water.

PRODUCTION

Examine the gaseous phase.

If the test is performed on a cylinder of gas, keep the cylinder of the substance to be examined at room temperature for not less than 6 h before carrying out the tests. Keep the cylinder in the vertical position with the outlet valve uppermost.

Carbon monoxide. Gas chromatography (2.2.28).

Gas to be examined. The substance to be examined.

Reference gas. A mixture containing 5 ppm V/V of *carbon monoxide R* in *nitrogen R1*.

Column:

- *material*: stainless steel,

- *size*: *l* = 2 m, Ø = 4 mm,

- *stationary phase*: an appropriate molecular sieve for chromatography (0.5 nm).

Carrier gas: *helium for chromatography R*.

Flow rate: 60 ml/min.

Temperature:

- *column*: 50 °C,

- *injection port and detector*: 130 °C.

Detection: flame ionisation with methaniser.

Injection: loop injector.

Adjust the injected volumes and the operating conditions so that the height of the peak due to carbon monoxide in the chromatogram obtained with the reference gas is at least 35 per cent of the full scale of the recorder.

Limit:

- *carbon monoxide*: not more than the area of the corresponding peak in the chromatogram obtained with the reference gas (5 ppm V/V).

Nitrogen monoxide and nitrogen dioxide: maximum 2 ppm V/V in total, determined using a chemiluminescence analyser (2.5.26).

Gas to be examined. The substance to be examined.

Reference gas (a). *Carbon dioxide R1*.

Reference gas (b). A mixture containing 2 ppm V/V of *nitrogen monoxide R* in *carbon dioxide R1* or in *nitrogen R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of nitrogen monoxide and nitrogen dioxide in the gas to be examined.

If nitrogen is used instead of carbon dioxide in reference gas (b), multiply the result obtained by the quenching correction factor in order to correct the quenching effect on the analyser response caused by the carbon dioxide matrix effect.

The quenching correction factor is determined by applying a known reference mixture of nitrogen monoxide in carbon dioxide and comparing the actual content with the content indicated by the analyser which has been calibrated with a NO/N₂ reference mixture.

$$\text{Quenching correction factor} = \frac{\text{actual nitrogen monoxide content}}{\text{indicated nitrogen monoxide content}}$$

Figure 0375.-1.– UV Fluorescence Analyser

Total sulphur: maximum 1 ppm V/V, determined using an ultraviolet fluorescence analyser after oxidation of the sulphur compounds by heating at 1000 °C (Figure 0375.-1).

The apparatus consists of the following:

- a system generating ultraviolet radiation with a wavelength of 210 nm, made up of an ultraviolet lamp, a collimator, and a selective filter; the beam is blocked periodically by a chopper rotating at high speed,
- a reaction chamber through which flows the previously filtered gas to be examined,
- a system that detects radiation emitted at a wavelength of 350 nm, made up of a selective filter, a photomultiplier tube and an amplifier.

Gas to be examined. The substance to be examined.

Reference gas (a). Carbon dioxide R1.

Reference gas (b). A mixture containing between 0.5 ppm V/V and 2 ppm V/V of hydrogen sulphide R1 in carbon dioxide R1.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Pass the gas to be examined through a quartz oven heated to 1000 °C. Oxygen R is circulated in the oven at a tenth of the flow rate of the gas to be examined. Measure the sulphur dioxide content in the gaseous mixture leaving the oven.

Water: maximum 67 ppm V/V, determined using an electrolytic hygrometer (2.5.28).

Assay. Infrared analyser (2.5.24).

Gas to be examined. The substance to be examined. It must be filtered to avoid stray light phenomena.

Reference gas (a). Carbon dioxide R1.

Reference gas (b). A mixture containing 95.0 per cent V/V of carbon dioxide R1 and 5.0 per cent V/V of nitrogen R1.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of carbon dioxide in the gas to be examined.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of carbon dioxide.

B. Place a glowing splinter of wood in an atmosphere of the substance to be examined. It is extinguished.

C. Pass a stream of the substance to be examined through barium hydroxide solution R. A white precipitate is formed which dissolves with effervescence in dilute acetic acid R.

TESTS

Examine the gaseous phase.

If the test is performed on a cylinder of gas, keep the cylinder of the substance to be examined at room temperature for not less than 6 h before carrying out the tests. Keep the cylinder in the vertical position with the outlet valve uppermost.

Carbon monoxide: maximum 5 ppm V/V, determined using a carbon monoxide detector tube (2.1.6).

Hydrogen sulphide: maximum 1 ppm V/V, determined using a hydrogen sulphide detector tube (2.1.6).

Nitrogen monoxide and nitrogen dioxide: maximum 2 ppm V/V in total, determined using a nitrogen monoxide and nitrogen dioxide detector tube (2.1.6).

Sulphur dioxide: maximum 2 ppm V/V, determined using a sulphur dioxide detector tube (2.1.6).

Water vapour: maximum 67 ppm V/V, determined using a water vapour detector tube (2.1.6).

STORAGE

Store liquefied under pressure in suitable containers complying with the legal regulations.

IMPURITIES

- nitrogen monoxide,
- nitrogen dioxide,
- carbon monoxide,
- total sulphur,
- water.

01/2005:1081

CARBOPLATIN

Carboplatinum

$C_6H_{12}N_2O_4Pt$

M_r 371.3

DEFINITION

Carboplatin contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (SP-4-2)-diammine[cyclobutan-1,1-dicarboxylato(2-)-O,O']platin, calculated with reference to the dried substance.

CHARACTERS

A colourless, crystalline powder, sparingly soluble in water, very slightly soluble in acetone and in alcohol.

It melts at about 200 °C, with decomposition.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the Ph. Eur. reference spectrum of carboplatin.

TESTS

Solution S1. Dissolve 0.25 g in carbon dioxide-free water R and dilute to 25 ml with the same solvent.

Solution S2. Dissolve 1.0 g in water R, heating slightly if necessary, and dilute to 40 ml with the same solvent. Filter if necessary.

Appearance of solution. Solution S1 is clear (2.2.1) and colourless (2.2.2, Method II).

Impurity B and acidity. To 10 ml of solution S1 add 0.1 ml of phenolphthalein solution R1. The solution is colourless. Not more than 0.7 ml of 0.01 M sodium hydroxide is required to change the colour of the indicator to pink (0.5 per cent calculated as impurity B).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of equal volumes of acetonitrile R and water R and dilute to 20.0 ml with the same mixture.

Reference solution. Dilute 0.5 ml of the test solution to 200.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *aminopropylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 130 volumes of *water R* and 870 volumes of *acetonitrile R*,
- a 10 µl loop injector,
- as detector a spectrophotometer set at 230 nm.

Inject the test solution. The test is not valid unless:

- the mass distribution ratio, D_m , is not less than 4.0,
- the number of theoretical plates, n , is not less than 5000,
- the symmetry factor is not more than 2.0.

If necessary adjust the concentration of acetonitrile in the mobile phase.

Inject the test solution and the reference solution. Continue the chromatography for 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution; the area of any peak apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (0.25 per cent); the sum of the areas of all the peaks apart from the principal peak is not greater than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution.

Chlorides (2.4.4). Dilute 10 ml of solution S2 to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm). Prepare the standard using 5 ml of *chloride standard solution (5 ppm Cl) R*.

Ammonium (2.4.1). 0.20 g complies with the limit test B for ammonium (100 ppm). Prepare the standard using 0.2 ml of *ammonium standard solution (100 ppm NH₄) R*.

Silver. Not more than 10 ppm of Ag, determined by atomic emission spectrometry (2.2.22, *Method I*).

Test solution. Dissolve 0.50 g in a 1 per cent V/V solution of *nitric acid R* and dilute to 50.0 ml with the same acid.

Reference solutions. Prepare the reference solutions using *silver standard solution (5 ppm Ag) R*, diluted with a 1 per cent V/V solution of *nitric acid R*.

Measure the intensity emitted at 328.1 nm.

Soluble barium. Not more than 10 ppm of Ba, determined by atomic emission spectrometry (2.2.22, *Method I*).

Test solution. Use the solution described in the test for silver.

Reference solutions. Prepare the reference solutions using *barium standard solution (50 ppm Ba) R*, diluted with a 1 per cent V/V solution of *nitric acid R*.

Measure the intensity emitted at 455.4 nm.

Heavy metals (2.4.8). 12 ml of solution S2 complies with limit test A for heavy metals (20 ppm). Prepare the standard using 5 ml of *lead standard solution (1 ppm Pb R)*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Use the residue obtained in the test for loss on drying.

Ignite 0.200 g of the residue to constant mass at 800 °C.

1 mg of the residue is equivalent to 1.903 mg of C₁₂H₂₄N₂O₄Pt.

STORAGE

Store protected from light.

IMPURITIES

A. cisplatin,

B. cyclobutane-1,1-dicarboxylic acid.

01/2005:1689

CARISOPRODOL

Carisoprodolum

C₁₂H₂₄N₂O₄

M_r 260.3

DEFINITION

(2*RS*)-2-[(Carbamoyloxy)methyl]-2-methylpentyl (1-methylethyl)carbamate.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, fine powder.

Solubility: very slightly soluble in water, freely soluble in acetone, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 92 °C to 95 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *carisoprodol CRS*.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (d).

D. Dissolve 0.2 g in 15 ml of a 28 g/l solution of *potassium hydroxide R* in *alcohol R* and boil under a reflux condenser for 15 min. Add 0.5 ml of *glacial acetic acid R* and 1 ml of a 50 g/l solution of *cobalt nitrate R* in *ethanol R*. An intense blue colour develops.

TESTS

Optical rotation (2.2.7): −0.10° to +0.10°.

Dissolve 2.5 g in *alcohol R* and dilute to 25.0 ml with the same solvent.

Related substances. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methylene chloride R*.

Reference solution (a). Dissolve 5.0 mg of *meprobamate CRS* in *methylene chloride R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 50 ml with *methylene chloride R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *methylene chloride R*.

Reference solution (d). Dissolve 20 mg of *carisoprodol CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (e). Dissolve 10 mg of *carisoprodol impurity A CRS* in 5 ml of reference solution (d) and dilute to 50 ml with *methylene chloride R*.

Plate: TLC silica gel plate *R*.

Mobile phase: acetone *R*, *methylene chloride R* (20:80 V/V).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air for 15 min.

Detection: spray with a solution prepared as follows: dissolve 5 g of *phosphomolybdic acid R* in a mixture of 50 ml of *glacial acetic acid R* and 10 ml of *sulphuric acid R*, and dilute to 100 ml with *glacial acetic acid R*. Heat the plate at 100-105 °C for 30 min.

System suitability:

- the chromatogram obtained with reference solution (c) shows 1 clearly visible spot,
- the chromatogram obtained with reference solution (e) shows 2 clearly separated spots.

Limits: in the chromatogram obtained with test solution (a):

- **impurity D:** any spot due to impurity D is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **any other impurity:** any spot, apart from the principal spot and any spot due to impurity D, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g *in vacuo* at 60 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 15 ml of a 25 per cent V/V solution of *sulphuric acid R* and boil under a reflux condenser for 3 h. Cool, dissolve by cautiously adding 30 ml of *water R*, cool again and place in a steam-distillation apparatus. Add 40 ml of *strong sodium hydroxide solution R* and distil immediately by passing steam through the mixture. Collect the distillate into 40 ml of a 40 g/l solution of *boric acid R* until the total volume in the receiver reaches about 200 ml. Add 0.25 ml of *methyl red mixed solution R*. Titrate with 0.1 M *hydrochloric acid*, until the colour changes from green to violet. Carry out a blank titration.

1 ml of 0.1 M *hydrochloric acid* is equivalent to 13.02 mg of $C_{12}H_{24}N_2O_4$.

IMPURITIES

- A. (2*RS*)-2-(hydroxymethyl)-2-methylpentyl (1-methylethyl)carbamate,

- B. 5-methyl-5-propyl-1,3-dioxan-2-one,

- C. 2-methyl-2-propylpropane-1,3-diol,

- D. meprobamate.

01/2005:0886

CARMELLOSE CALCIUM

Carmellosum calcicum

DEFINITION

Calcium salt of a partly *O*-carboxymethylated cellulose.

CHARACTERS

Appearance: white or yellowish-white powder, hygroscopic after drying.

Solubility: practically insoluble in acetone, in alcohol and in toluene. It swells with water to form a suspension.

IDENTIFICATION

- Shake 0.1 g thoroughly with 10 ml of *water R*. Add 2 ml of *dilute sodium hydroxide solution R* and allow to stand for 10 min (solution A). Dilute 1 ml of solution A to 5 ml with *water R*. To 0.05 ml add 0.5 ml of a 0.5 g/l solution of *chromotropic acid, sodium salt R* in a 75 per cent *m/m* solution of *sulphuric acid R* and heat on a water-bath for 10 min. A reddish-violet colour develops.
- Shake 5 ml of solution A obtained in identification test A with 10 ml of *acetone R*. A white, flocculent precipitate is produced.
- Shake 5 ml of solution A obtained in identification test A with 1 ml of *ferric chloride solution R1*. A brown, flocculent precipitate is formed.
- Ignite 1 g and dissolve the residue in a mixture of 5 ml of *acetic acid R* and 10 ml of *water R*. Filter if necessary and boil the filtrate for a few minutes. Cool and neutralise with *dilute ammonia R1*. The solution gives reaction (a) of calcium (2.3.1).

TESTS

Solution S. Shake 1.0 g with 50 ml of *distilled water R*, add 5 ml of *dilute sodium hydroxide solution R* and dilute to 100 ml with *distilled water R*.

Alkalinity. Shake 1.0 g thoroughly with 50 ml of *carbon dioxide-free water R* and add 0.05 ml of *phenolphthalein solution R*. No red colour develops.

Chlorides (2.4.4): maximum 0.36 per cent.

Heat 28 ml of solution S with 10 ml of *dilute nitric acid R* on a water-bath until a flocculent precipitate is produced. Cool, centrifuge and separate the supernatant liquid. Wash the precipitate with 3 quantities, each of 10 ml, of *water R*, centrifuging each time. Combine the supernatant liquid and the washings and dilute to 100 ml with *water R*. To 25 ml

add 6 ml of *dilute nitric acid R* and dilute to 50 ml with *water R*. Dilute 10 ml of the solution to 15 ml with *water R*.

Sulphates (2.4.13): maximum 1 per cent.

Heat 20 ml of solution S with 1 ml of *hydrochloric acid R* on a water-bath until a flocculent precipitate is produced. Cool, centrifuge and separate the supernatant liquid. Wash the precipitate with 3 quantities, each of 10 ml, of *distilled water R*, centrifuging each time. Combine the supernatant liquid and the washings and dilute to 100 ml with *distilled water R*. To 25 ml add 1 ml of *dilute hydrochloric acid R* and dilute to 50 ml with *distilled water R*.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 4 h.

Sulphated ash (2.4.14): 10.0 per cent to 20.0 per cent, determined on 1.0 g in a platinum crucible.

STORAGE

In an airtight container.

01/2005:0472

CARMELLOSE SODIUM

Carmellosum natricum

DEFINITION

Carmellose sodium (carboxymethylcellulose sodium) is the sodium salt of a partly *O*-carboxymethylated cellulose. It contains not less than 6.5 per cent and not more than 10.8 per cent of sodium (Na), calculated with reference to the dried substance.

CHARACTERS

A white or almost white, granular powder, hygroscopic after drying, practically insoluble in acetone, in ethanol and in toluene. It is easily dispersed in water giving colloidal solutions.

IDENTIFICATION

- To 10 ml of solution S (see Tests) add 1 ml of *copper sulphate solution R*. A blue, cotton-like precipitate is formed.
- Boil 5 ml of solution S for a few minutes. No precipitate is formed.
- The solution prepared from the sulphated ash in the test for heavy metals gives the reactions of sodium (2.3.1).

TESTS

Solution S. Sprinkle a quantity of the substance to be examined equivalent to 1.0 g of the dried substance onto 90 ml of *carbon dioxide-free water R* at 40 °C to 50 °C stirring vigorously. Continue stirring until a colloidal solution is obtained, cool and dilute to 100 ml with *carbon dioxide-free water R*.

Appearance of solution. Solution S is not more opalescent than reference suspension III (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 6.0 to 8.0.

Apparent viscosity. While stirring, introduce a quantity of the substance to be examined equivalent to 2.00 g of the dried substance into 50 ml of *water R* heated to 90 °C. For a product of low viscosity, use if necessary, the quantity required to give the concentration indicated on the label. Allow to cool, dilute to 100.0 ml with *water R* and stir until dissolution is complete. Determine the viscosity (2.2.10) using a rotating viscometer at 20 °C and a shear rate of 10 s⁻¹. If it is impossible to obtain a shear rate of exactly 10 s⁻¹, use a shear rate slightly higher and a rate slightly lower and interpolate. The apparent viscosity is not less than 75 per cent and not more than 140 per cent of the value stated on the label.

Sodium glycollate. Place a quantity of the substance to be examined equivalent to 0.500 g of dried substance in a beaker. Add 5 ml of *acetic acid R* and 5 ml of *water R*. Stir until dissolution is complete (about 30 min). Add 80 ml of *acetone R* and 2 g of *sodium chloride R*. Filter through a fast filter paper impregnated with *acetone R* into a volumetric flask, rinse the beaker and filter with *acetone R* and dilute the filtrate to 100.0 ml with the same solvent. Allow to stand for 24 h without shaking. Use the clear supernatant liquid to prepare the test solution.

In a volumetric flask, dissolve 0.310 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R*, in *water R* and dilute to 1000.0 ml with the same solvent. Place 5.0 ml of this solution in a volumetric flask, add 5 ml of *acetic acid R* and allow to stand for about 30 min. Add 80 ml of *acetone R* and 2 g of *sodium chloride R* and dilute to 100.0 ml with *acetone R*. Use this solution to prepare the reference solution.

Place 2.0 ml of each solution in a separate 25 ml volumetric flask. Heat on a water-bath to eliminate acetone. Cool to room temperature and add 5.0 ml of *2,7-dihydroxynaphthalene solution R* to each flask. Shake and add 15.0 ml of *2,7-dihydroxynaphthalene solution R*. Close the flasks with aluminium foil and heat on a water-bath for 20 min. Cool under running water and dilute to 25.0 ml with *sulphuric acid R*. Within 10 min, transfer 10.0 ml of each solution to a flat-bottomed tube. Examine the solutions viewing vertically. The test solution is not more intensely coloured than the reference solution (0.4 per cent).

Chlorides (2.4.4). Dilute 2 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (0.25 per cent).

Heavy metals (2.4.8). To the residue obtained in the determination of the sulphated ash, add 1 ml of *hydrochloric acid R* and evaporate on a water-bath. Take up the residue in 20 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14): 20.0 per cent to 33.3 per cent, determined on 1.0 g using a mixture of equal volumes of *sulphuric acid R* and *water R* and calculated with reference to the dried substance. These limits correspond to a content of 6.5 per cent to 10.8 per cent of sodium (Na).

LABELLING

The label states the apparent viscosity in millipascal seconds for a 20 g/l solution; for a product of low viscosity, the label states the concentration of the solution to be used and the apparent viscosity in millipascal seconds.

01/2005:1186

CARMELLOSE SODIUM, LOW-SUBSTITUTED

Carmellosum natricum, substitutum humile

DEFINITION

Low-substituted carmellose sodium (sodium carboxymethylcellulose) is the sodium salt of a partly *O*-(carboxymethylated) cellulose. It contains not less than 2.0 per cent and not more than 4.5 per cent of sodium (Na), calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder or short fibres, practically insoluble in acetone, in ethanol and in toluene. It swells in water to form a gel.

IDENTIFICATION

- Shake 1 g with 100 ml of a 100 g/l solution of *sodium hydroxide R*. A suspension is produced.
- Shake 1 g with 50 ml of *water R*. Transfer 1 ml of the mixture to a test tube, add 1 ml of *water R* and 0.05 ml of a freshly prepared 40 g/l solution of α -*naphthol R* in *methanol R*. Incline the test tube and add carefully 2 ml of *sulphuric acid R* down the side so that it forms a lower layer. A reddish-purple colour develops at the interface.
- It complies with the test for sulphated ash (2.4.14) (see Tests).
- The solution prepared from the sulphated ash for the test for heavy metals gives reaction (a) of sodium (2.3.1).

TESTS

pH (2.2.3). Shake 1 g with 100 ml of *carbon dioxide-free water R* for 5 min. Centrifuge. The pH of the suspension is 6.0 to 8.5.

Sodium chloride and sodium glycollate. The sum of the percentages of sodium chloride and sodium glycollate is not more than 0.5 per cent, calculated with reference to the dried substance.

Sodium chloride. Place 5.00 g in a 250 ml conical flask, add 50 ml of *water R* and 5 ml of *strong hydrogen peroxide solution R* and heat on a water bath for 20 min, stirring occasionally to ensure total hydration. Cool, add 100 ml of *water R* and 10 ml of *nitric acid R*. Titrate with 0.05 *M silver nitrate* determining the end-point potentiometrically (2.2.20) using a silver-based indicator electrode and a double-junction reference electrode containing a 100 g/l solution of *potassium nitrate R* in the outer jacket and a standard filling solution in the inner jacket.

1 ml of 0.05 *M silver nitrate* is equivalent to 2.922 mg of NaCl.

Sodium glycollate. Place a quantity of the substance to be examined equivalent to 0.500 g of the dried substance in a beaker. Add 5 ml of *glacial acetic acid R* and 5 ml of *water R* and stir to ensure total hydration (about 30 min). Add 80 ml of *acetone R* and 2 g of *sodium chloride R*. Stir for several minutes to ensure complete precipitation of the carboxymethylcellulose. Filter through a fast filter paper impregnated with *acetone R* into a volumetric flask, rinse the beaker and filter with *acetone R* and dilute the filtrate to 100.0 ml with the same solvent. Allow to stand for 24 h without shaking. Use the clear supernatant as the test solution.

Prepare the reference solutions as follows: in a 100 ml volumetric flask, dissolve 0.100 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R*, in *water R* and dilute to 100.0 ml with the same solvent. Transfer 0.5 ml, 1.0 ml, 1.5 ml and 2.0 ml of the solution to separate volumetric flasks; dilute the contents of each flask to 5.0 ml with *water R*, add 5 ml of *glacial acetic acid R*, dilute to 100.0 ml with *acetone R* and mix.

Transfer 2.0 ml of the test solution and 2.0 ml of each of the reference solutions to separate 25 ml volumetric flasks. Heat the uncovered flasks in a water-bath to eliminate the acetone. Allow to cool and add 5.0 ml of *2,7-dihydroxynaphthalene solution R* to each flask. Mix, add a further 15.0 ml of *2,7-dihydroxynaphthalene solution R* and mix again. Close the flasks with aluminium foil and heat in a water-bath for 20 min. Cool and dilute to 25.0 ml with *sulphuric acid R*.

Measure the absorbance (2.2.25) of each solution at 540 nm. Prepare a blank using 2.0 ml of a solution containing 5 per cent *V/V* each of *glacial acetic acid R* and *water R* in *acetone R*. Prepare a standard curve using the absorbances obtained with the reference solutions. From the standard curve and the absorbance of the test solution, determine the mass *a*, in milligrams, of glycollic acid in the substance to be examined and calculate the content of sodium glycollate from the formula:

$$\frac{10 \times 1.29 \times a}{(100 - b) m}$$

1.29 = the factor converting glycollic acid to sodium glycollate,

b = the loss on drying as a percentage,

m = the mass of the substance to be examined, in grams.

Water-soluble substances. Not more than 70.0 per cent. Disperse 5.00 g in 400.0 ml of *water R* and stir for 1 min every 10 min during the first 30 min. Allow to stand for 1 h and centrifuge, if necessary. Decant 100.0 ml of the supernatant liquid onto a fast filter paper in a vacuum filtration funnel, apply vacuum and collect 75.0 ml of the filtrate. Evaporate to dryness and dry the residue at 100-105 °C for 4 h.

Heavy metals (2.4.8). To the residue obtained in the determination of the sulphated ash add 1 ml of *hydrochloric acid R* and evaporate on a water-bath. Take up the residue in 20 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14): 6.5 per cent to 13.5 per cent, determined on 1.0 g using a mixture of equal volumes of *sulphuric acid R* and *water R* and calculated with reference to the dried substance. These limits correspond to a content of 2.0 per cent to 4.5 per cent of Na.

The following test concerning the pharmaco-technological properties may be carried out depending on the intended formulation. It is not a mandatory requirement.

Settling volume. In a 100 ml graduated cylinder, place 20 ml of *2-propanol R*, add 5.0 g of the substance to be examined and shake vigorously. Dilute to 30 ml with *2-propanol R* then to 50 ml with *water R* and shake vigorously. Within 15 min, repeat the shaking three times. Allow to stand for 4 h and determine the volume of the settled mass (15.0 ml to 35.0 ml).

01/2005:1187 STORAGE

Store in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

IMPURITIES

A. 1,3-bis(2-chloroethyl)urea.

CARMUSTINE

Carmustinum

$C_5H_9Cl_2N_3O_2$

M_r 214.1

DEFINITION

Carmustine contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 1,3-bis(2-chloroethyl)-1-nitrosourea, calculated with reference to the anhydrous substance.

CHARACTERS

A yellowish, granular powder, very slightly soluble in water, very soluble in methylene chloride, freely soluble in ethanol. It melts at about 31 °C with decomposition.

IDENTIFICATION

Examine by infrared absorption spectrophotometry(2.2.24), comparing with the *Ph. Eur. reference spectrum of carmustine*. Examine the melted substances prepared as films.

TESTS

1,3-bis(2-chloroethyl)urea (impurity A). Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 0.10 g of the substance to be examined in *methylene chloride R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *carmustine impurity A CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of the test solution to 10 ml with *methylene chloride R*. To 5 ml of this solution, add 5 ml of reference solution (a).

Apply separately to the plate 2 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *methylene chloride R*. Allow the plate to dry in air. Spray with *diethylamine R* and heat at 125 °C for 10 min. Allow to cool and spray with *silver nitrate solution R2*. Expose to ultraviolet light at 365 nm until brown to black spots appear. Any spot corresponding to carmustine impurity A in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Water (2.5.12). Not more than 1.0 per cent, determined on 0.50 g by the semi-micro determination of water.

ASSAY

Dissolve 0.100 g in 30 ml of *ethanol R* and dilute to 100.0 ml with *water R*. Dilute 3.0 ml of the solution to 100.0 ml with *water R*. Measure the absorbance (2.2.25) at the maximum at 230 nm.

Calculate the content of $C_5H_9Cl_2N_3O_2$ taking the specific absorbance to be 270.

01/2005:0597

CARNAUBA WAX

Cera carnauba

DEFINITION

Purified wax obtained from the leaves of *Copernicia cerifera* Mart.

CHARACTERS

Appearance: pale yellow or yellow powder, flakes or hard masses.

Solubility: practically insoluble in water, soluble on heating in ethyl acetate and in xylene, practically insoluble in alcohol.

Relative density: about 0.97.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.10 g of the substance to be examined with heating in 5 ml of *chloroform R*. Use the warm solution.

Reference solution. Dissolve 5 mg of *menthol R*, 5 µl of *menthyl acetate R* and 5 mg of *thymol R* in 10 ml of *toluene R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *ethyl acetate R*, *chloroform R* (2:98 V/V).

Application: 30 µl of the test solution and 10 µl of the reference solution as bands 20 mm by 3 mm.

Development: over half of the plate.

Drying: in air.

Detection: spray with a freshly prepared 200 g/l solution of *phosphomolybdic acid R* in *alcohol R* (about 10 ml for a 20 cm plate). Heat at 100-105 °C for 10-15 min.

Results: the chromatogram obtained with the reference solution shows in the lower part a dark blue zone (menthol), above this zone a reddish zone (thymol) and in the upper part a dark blue zone (menthyl acetate). The chromatogram obtained with the test solution shows a large blue zone (triacontanol = melissyl alcohol) at a level between the thymol and menthol zones in the chromatogram obtained with the reference solution. Further blue zones are visible in the upper part of the chromatogram obtained with the test solution, at levels between those of the menthyl acetate and thymol zones in the chromatogram obtained with the reference solution; above these zones further zones are visible in the chromatogram obtained with the test solution; the zone with the highest R_f value is very pronounced. A number of faint zones are visible below the triacontanol zone and the starting point is coloured blue.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than a 50 mg/l solution of *potassium dichromate R* (2.2.2, Method II).

Dissolve 0.10 g with heating in *chloroform R* and dilute to 10 ml with the same solvent.

Melting point (2.2.15): 80 °C to 88 °C.

Melt the substance to be examined carefully on a water-bath before introduction into the capillary tubes. Allow the tubes to stand in the refrigerator for 24 h or at 0 °C for 2 h.

Acid value: 2 to 7.

To 2.000 g (*m* g) in a 250 ml conical flask fitted with a reflux condenser add 40 ml of *xylene R* and a few glass beads. Heat with stirring until the substance is completely dissolved. Add 20 ml of *alcohol R* and 1 ml of *bromothymol blue solution R3* and titrate the hot solution with 0.5 M *alcoholic potassium hydroxide* until a green colour persisting for at least 10 s is obtained (*n*₁ ml). Carry out a blank test (*n*₂ ml). Calculate the acid value from the expression:

$$\frac{28.05 (n_1 - n_2)}{m}$$

Saponification value: 78 to 95.

To 2.000 g (*m* g) in a 250 ml conical flask fitted with a reflux condenser add 40 ml of *xylene R* and a few glass beads. Heat with stirring until the substance is completely dissolved. Add 20 ml of *alcohol R* and 20.0 ml of 0.5 M *alcoholic potassium hydroxide*. Boil under a reflux condenser for 3 h. Add 1 ml of *phenolphthalein solution R1* and titrate the hot solution immediately with 0.5 M *hydrochloric acid* until the red colour disappears. Repeat the heating and titration until the colour no longer reappears on heating (*n*₃ ml). Carry out a blank test (*n*₄ ml). Calculate the saponification value from the expression:

$$\frac{28.05 (n_4 - n_3)}{m}$$

Total ash (2.4.16): maximum 0.25 per cent, determined on 2.0 g.

STORAGE

Protected from light.

Solubility: soluble in water, sparingly soluble in methanol, slightly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of *carteolol hydrochloride*.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, Method II).

Dissolve 0.300 g in *water R* and dilute to 10 ml with the same solvent.

pH (2.2.3): 5.0 to 6.0.

Dissolve 0.250 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of *carteolol for system suitability CRS* in the mobile phase and dilute to 5 ml with the mobile phase.

Reference solution (d). Dilute 5.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

Column:

- size: *l* = 0.25 m, Ø = 4.6 mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: mix 1 volume of *methanol R2*, 20 volumes of *acetonitrile R* and 79 volumes of a 2.82 g/l solution of *sodium hexanesulphonate R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 252 nm.

Injection: 20 µl.

System suitability:

- the chromatogram obtained with reference solution (c) is similar to the chromatogram provided with *carteolol for system suitability CRS*; the peaks due to impurity H and carteolol show base-line separation,
- *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (d),
- *number of theoretical plates*: minimum 6000, calculated for the principal peak in the chromatogram obtained with reference solution (a).

Limits: locate impurity H by comparison with the chromatogram provided with *carteolol for system suitability CRS*,

- *impurity H*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

01/2005:1972

CARTEOLOL HYDROCHLORIDE

Carteololi hydrochloridum

C₁₆H₂₅N₂O₃Cl

*M*_r 328.8

DEFINITION

5-[(2*RS*)-3-[(1,1-Dimethylethyl)amino]-2-hydroxypropoxy]-3,4-dihydroquinolin-2(1*H*)-one hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white crystals or crystalline powder.

- *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 60 ml of *alcohol R*. Add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 32.88 mg of $C_{16}H_{25}N_2O_3Cl$.

STORAGE

In an airtight container.

IMPURITIES

- A. 4,6,7,8-tetrahydroquinoline-2,5(1*H*,3*H*)-dione,

- B. 5-hydroxy-3,4-dihydroquinolin-2(1*H*)-one,

- C. 5-[(2*RS*)-oxiran-2-yl]methoxy-3,4-dihydroquinolin-2(1*H*)-one,

- D. R = Cl, R' = H: 5-[(2*RS*)-3-chloro-2-hydroxypropoxy]-3,4-dihydroquinolin-2(1*H*)-one,

- F. R = OCH₃, R' = H: 5-[(2*RS*)-2-hydroxy-3-methoxypropoxy]-3,4-dihydroquinolin-2(1*H*)-one,

- G. R = OH, R' = H: 5-[(2*RS*)-2,3-dihydroxypropoxy]-3,4-dihydroquinolin-2(1*H*)-one,

- I. R = NH-C(CH₃)₃, R' = Br: 7-bromo-5-[(2*RS*)-3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]-3,4-dihydroquinolin-2(1*H*)-one,

- E. 5,5'-[(2-hydroxypropan-1,3-diyl)bis(oxy)]bis(3,4-dihydroquinolin-2(1*H*)-one),

- H. 5-[(2*RS*)-3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]quinolin-2(1*H*)-one.

01/2005:1745

CARVEDILOL

Carvedilolum

$C_{24}H_{26}N_2O_4$

M_r 406.5

DEFINITION

(2*RS*)-1-(9*H*-Carbazol-4-yloxy)-3-[[2-(2-methoxyphenoxy)ethyl]amino]propan-2-ol.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, slightly soluble in alcohol, practically insoluble in dilute acids.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of carvedilol*.

If the spectrum obtained shows differences, dissolve the substance to be examined in 2-propanol *R*, evaporate to dryness and record a new spectrum using the residue.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *carvedilol impurity C CRS* in 5.0 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

– *size*: $l = 0.125$ m, $\varnothing = 4.6$ mm,

- *stationary phase*: octylsilyl silica gel for chromatography R (5 µm),
- *temperature*: 55 °C.

Mobile phase: dissolve 1.77 g of *potassium dihydrogen phosphate* R in *water* R and dilute to 650 ml with the same solvent; adjust to pH 2.0 with *phosphoric acid* R and add 350 ml of *acetonitrile* R.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 µl.

Run time: 8 times the retention time of carvedilol.

Relative retention with reference to carvedilol (retention time = about 4 min): impurity A = about 0.6; impurity C = about 3.5; impurity B = about 6.7.

System suitability: reference solution (b):

- *resolution*: minimum 17 between the peaks due to carvedilol and to impurity C.

Limits:

- *correction factor*: for the calculation of content, multiply the peak area of impurity A by 2,
- *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *impurity C*: not more than twice the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.02 per cent),
- *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.01 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2.0 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 60 ml of *anhydrous acetic acid* R. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 40.65 mg of C₂₄H₂₆N₂O₄.

IMPURITIES

- A. 1-[[9-[2-hydroxy-3-[[2-(2-methoxyphenoxy)ethyl]amino]propyl]-9H-carbazol-4-yl]oxy]-3-[[2-(2-methoxyphenoxy)ethyl]amino]propan-2-ol,

- B. 1,1'-[[2-(2-methoxyphenoxy)ethyl]nitrilo]bis[3-(9H-carbazol-4-yloxy)propan-2-ol],

and enantiomer

- C. (2*RS*)-1-[benzyl[2-(2-methoxyphenoxy)ethyl]amino]-3-(9H-carbazol-4-yloxy)propan-2-ol.

01/2005:0105

CASCARA

Rhamni purshianae cortex

DEFINITION

Cascara consists of the dried, whole or fragmented bark of *Rhamnus purshianus* D.C. (*Frangula purshiana* (D.C.) A. Gray ex J. C. Cooper). It contains not less than 8.0 per cent of hydroxyanthracene glycosides of which not less than 60 per cent consists of cascariosides, both expressed as cascarioside A (C₂₇H₃₂O₁₄; *M_r* 580.5) and calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The bark occurs in slightly channelled or nearly flat pieces, usually 1 mm to 5 mm in thickness, usually varying greatly in length and width. The outer surface is grey or dark greyish-brown and shows occasional lenticels that are orientated transversally. It is usually more or less completely covered by a whitish coat of lichens, epiphytic moss and foliaceous liverwort. The inner surface is yellow to reddish-brown or almost black with fine longitudinal striations; it turns red when treated with alkali. The yellow fracture is short and granular in the outer part and somewhat fibrous at the inner part.
- B. Reduce to a powder (355). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution* R. The powder shows: bundles of partly lignified phloem fibres accompanied by crystal sheaths containing prisms of calcium oxalate; groups of sclereids accompanied by crystal sheaths; cluster crystals of calcium oxalate; some parenchymatous cells contain a yellow substance which becomes deep red when treated with alkali; cork cells and, frequently, epiphytes; the latter may be liverworts, entire or in fragments, having a

lamina one cell thick without a midrib and composed of isodiametric cells, or leaves of mosses, having a lamina one cell thick composed of elongated cells and possessing a midrib several cells thick.

- C. Examine the chromatograms obtained in the test for “Other species of *Rhamnus*; anthrones” after spraying with a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V) R* and heating. The chromatogram obtained with the test solution shows several reddish-brown zones with different intensities: there are four faint zones, three being situated at about the mid-point of the chromatogram and one in the lower third and there is a strong zone in the upper third of the chromatogram. Examine in ultraviolet light at 365 nm. The chromatogram obtained with the test solution shows several zones with the same fluorescence, situated above and particularly below (cascarosides) that corresponding to barbaloin in the chromatogram obtained with the reference solution.
- D. Heat 0.2 g of the powdered drug (180) with 50 ml of *water R* on a water-bath for 15 min. Allow to cool and filter. To 10 ml of the filtrate add 20 ml of *hydrochloric acid R1* and heat on a water-bath for 15 min. Allow to cool, transfer to a separating funnel and shake with three quantities, each of 20 ml, of *ether R*. Reserve the aqueous layer (solution A).
- (a) Combine the three ether extracts and shake with 10 ml of *dilute ammonia R2*. The aqueous layer becomes reddish-violet.
- (b) Transfer solution A to a small flask, add 5 g of *ferric chloride R* and heat on a water-bath for 30 min. Allow to cool, transfer to a separating funnel and shake with 15 ml of *ether R*. Wash the ether layer with 10 ml of *water R*, discard the water and shake the ether layer with 5 ml of *dilute ammonia R2*. A red colour develops in the aqueous layer.

TESTS

Other species of *Rhamnus*; anthrones. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. To 0.5 g of the powdered drug (180) add 5 ml of *alcohol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

Reference solution. Dissolve 20 mg of *barbaloin R* in *alcohol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Apply separately to the plate as bands 10 µl of each solution. Develop over a path of 10 cm using a mixture of 13 volumes of *water R*, 17 volumes of *methanol R* and 100 volumes of *ethyl acetate R*. Allow the plate to dry for 5 min, spray with about 10 ml of a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V) R* and heat at 100 °C to 105 °C for 15 min. Examine the chromatograms immediately after heating. The chromatogram obtained with the reference solution shows, in the central part, a reddish-brown zone corresponding to barbaloin. Examine in ultraviolet light at 365 nm. The zone corresponding to barbaloin shows intense yellowish-brown fluorescence. In the chromatogram obtained with the test solution, no zone with orange-brown fluorescence is seen between the zone of barbaloin and the zones of cascarosides.

Apply to another plate as a band 10 µl of the test solution and develop as described above. Allow the plate to dry for not longer than 5 min and spray immediately with a 5 g/l

solution of *nitrotetrazolium blue R* in *methanol R*. Examine the chromatogram immediately. No violet or greyish-blue zones appear.

Foreign matter (2.8.2). Not more than 1 per cent.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug (180) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 7.0 per cent.

ASSAY

Carry out the assay protected from bright light in one day.

Stir 1.00 g of the powdered drug (180) into 100 ml of boiling *water R* and continue boiling and stirring for 5 min. Allow to cool, dilute to 100.0 ml with *water R*, shake, filter and discard the first 20 ml of filtrate. Transfer 10.0 ml of the filtrate to a separating funnel, add 0.1 ml of 1 M *hydrochloric acid* and shake with two quantities, each of 20 ml, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic extracts with 5 ml of *water R*, discard the organic layer and return the rinsings to the aqueous layer. Shake the combined aqueous layers with four quantities, each of 30 ml, of *ethyl acetate R* freshly saturated with *water R*, (to 150 ml of *ethyl acetate R* add 15 ml of *water R*, shake for 3 min and allow to stand) on each occasion allowing separation to take place until the organic layer is clear. Combine the ethyl acetate extracts. Use the aqueous layer for the assay for cascarosides and the organic layer for the assay for hydroxyanthracene glycosides other than cascarosides.

Hydroxyanthracene glycosides other than cascarosides.

Transfer the organic layer to a suitable flask and remove the solvent by distillation, evaporating almost to dryness. Dissolve the residue in 0.3 ml to 0.5 ml of *methanol R* and transfer to a volumetric flask, rinsing the first flask with warm *water R* and adding the rinsings to the methanolic solution. Allow to cool and dilute to 50.0 ml with *water R*. Transfer 20.0 ml of the solution to a 100 ml round-bottomed flask with a ground-glass neck and containing 2 g of *ferric chloride R* and 12 ml of *hydrochloric acid R*. Attach a reflux condenser and place the flask in a water-bath so that the level of the water is above that of the liquid in the flask and heat for 4 h. Allow to cool, transfer the solution to a separating funnel and rinse the flask successively with 3 ml to 4 ml of 1 M *sodium hydroxide* and 3 ml to 4 ml of *water R*, adding the rinsings to the separating funnel. Shake the contents of the separating funnel with three quantities, each of 30 ml, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic layers with two quantities, each of 10 ml, of *water R* and discard the rinsings. Dilute the organic phase to 100.0 ml with the mixture of ether and hexane. Take 20.0 ml, evaporate carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides, expressed as cascaroside A, from the expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

A = absorbance at 515 nm,

m = mass of the sample in grams.

Measure the absorbance of the test solution at 440 nm. If the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.4, the assay is not valid and must be repeated.

Cascarosides. Dilute the aqueous layer reserved for this assay to 50.0 ml with *water R*. Treat 20.0 ml of the solution as described above in the assay of hydroxyanthracene glycosides other than cascarosides.

Measure the absorbance of the test solution at 440 nm. If the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.4, the assay is not valid and must be repeated.

Calculate the percentage content of cascarosides, expressed as cascaroside A from the expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

A = absorbance at 515 nm,

m = mass of the sample in grams.

Measure the absorbance of the test solution at 440 nm. If the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.7, the assay is not valid and must be repeated.

STORAGE

Store protected from light.

01/2005:1496

CASSIA OIL

Cinnamomi cassiae aetheroleum

DEFINITION

Cassia oil is obtained by steam distillation of the leaves and young branches of *Cinnamomum cassia* Blume (*C. aromaticum* Nees).

CHARACTERS

A clear, mobile, yellow to reddish-brown liquid, with a characteristic odour reminiscent of cinnamic aldehyde.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 0.5 ml of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 µl of *trans-cinnamic aldehyde R*, 10 µl of *eugenol R* and 50 mg of *coumarin R* in *acetone R* and dilute to 10 ml with the same solvent.

Apply to the plate, as bands, 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 365 nm. The zone of blue fluorescence in the chromatogram obtained with the test solution is similar in position and colour to the zone in the chromatogram obtained with the reference solution (coumarin). Spray the plate with *anisaldehyde solution R*. Examine in daylight while heating at 100-105 °C for 5-10 min. The chromatogram obtained with the reference solution shows in its upper part a violet zone (eugenol) and above this zone a greenish-blue zone (*trans-cinnamic aldehyde*). The chromatogram obtained with the test solution shows a zone similar in position and colour to the zone due to *trans-cinnamic aldehyde* in the chromatogram obtained

with the reference solution and may show a very faint zone corresponding to eugenol. Other faint zones are present.

B. Examine the chromatograms obtained in the test for chromatographic profile. The retention times of the principal peaks in the chromatogram obtained with the test solution are similar to those in the chromatogram obtained with the reference solution. Eugenol may be absent from the chromatogram obtained with the test solution.

TESTS

Relative density (2.2.5): 1.052 to 1.070.

Refractive index (2.2.6): 1.600 to 1.614.

Optical rotation (2.2.7): -1° to $+1^{\circ}$.

Chromatographic profile. Examine by gas chromatography (2.2.28).

Test solution. The substance to be examined.

Reference solution. Dissolve 100 µl of *trans-cinnamic aldehyde R*, 10 µl of *cinnamyl acetate R*, 10 µl of *eugenol R*, 20 mg of *coumarin R* and 10 µl of *trans-2-methoxycinnamaldehyde R* in 1 ml of *acetone R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 60 m long and about 0.25 mm in internal diameter coated with *macrogol 20 000 R* as the bonded phase,
- *helium for chromatography R* as the carrier gas at a flow rate of 1.5 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 10	60	–	isothermal
	10 - 75	60 → 190	2	linear gradient
	75 - 160	190		isothermal
Injection port		200		
Detector		240		

Inject 0.2 µl of the reference solution. When the chromatogram is recorded in the prescribed conditions, the components elute in the order indicated in the composition of the reference solution. Depending on the operating conditions and the state of the column, coumarin may elute before or after *trans-2-methoxycinnamaldehyde*. Record the retention times of these substances.

The test is not valid unless the resolution between the peaks corresponding to coumarin and *trans-2-methoxycinnamaldehyde* is at least 1.5.

Inject 0.2 µl of the test solution. Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution. Determine the percentage content of each of these components by the normalisation procedure.

The percentages are within the following ranges:

- *trans-cinnamic aldehyde*: 70 per cent to 90 per cent,
- *cinnamyl acetate*: 1.0 per cent to 6.0 per cent,
- *eugenol*: less than 0.5 per cent,
- *coumarin*: 1.5 per cent to 4.0 per cent,
- *trans-2-methoxycinnamaldehyde*: 3.0 per cent to 15 per cent.

STORAGE

Store in a well-filled, airtight container, protected from light and heat.

corrected

CASTOR OIL, HYDROGENATED

Ricini oleum hydrogenatum

DEFINITION

Hydrogenated castor oil is the oil obtained by hydrogenation of *Virgin Castor oil* (0051). It consists mainly of the triglyceride of 12-hydroxystearic acid.

CHARACTERS

A fine, almost white or pale yellow powder or almost white or pale yellow masses or flakes, practically insoluble in water, freely soluble in methylene chloride, slightly soluble in light petroleum, very slightly soluble in ethanol.

IDENTIFICATION

- Melting point (2.2.14): 83 °C to 88 °C.
- It complies with the test for hydroxyl value (see Tests).
- It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (2.5.1). Not more than 4.0, determined on 10.0 g dissolved in 75 ml of hot *alcohol R*.

Hydroxyl value (2.5.3, *Method A*): 145 to 165, determined on a warm solution.

Iodine value (2.5.4). Not more than 5.0.

Alkaline impurities. Dissolve 1.0 g by gentle heating in a mixture of 1.5 ml of *alcohol R* and 3 ml of *toluene R*. Add 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *alcohol R*. Not more than 0.2 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to yellow.

Composition of fatty acids. Gas chromatography (2.4.22) with the following modifications.

Use the mixture of calibrating substances in Table 2.4.22.-3.

Test solution. Introduce 75 mg of the substance to be examined in a 10 ml centrifuge tube with a screw cap. Dissolve in 2 ml of 1,1-dimethylethyl methyl ether R1 by shaking and heat gently (50-60 °C). Add, when still warm, 1 ml of a 12 g/l solution of *sodium R* in *anhydrous methanol R*, prepared with the necessary precautions, and mix vigorously for at least 5 min. Add 5 ml of *distilled water R* and mix vigorously for about 30 s. Centrifuge for 15 min at 1500 g. Use the upper layer.

Reference solution. Dissolve 50 mg of *methyl 12-hydroxystearate CRS* and 50 mg of *methyl stearate CRS* in 10.0 ml of 1,1-dimethylethyl methyl ether R1.

The chromatographic procedure may be carried out using:

- a fused-silica column 30 m long and 0.25 mm in internal diameter coated with *macrogol 20 000 R* (film thickness 0.25 µm),
- helium for chromatography R* as the carrier gas at a flow rate of 0.9 ml/min,
- a flame-ionisation detector,
- a split injector (1:100),

maintaining the temperature of the column at 215 °C for 55 min and maintaining the temperature of the injection port and that of the detector at 250 °C.

Inject 1 µl of each solution.

Calculate the fraction of each fatty acid using the following expression:

$$A_{x,s,c} / \sum A_{x,s,c} \times 100 \text{ per cent } m/m$$

$A_{x,s,c}$ = corrected peak area of the fatty acid in the test solution:

$$A_{x,s,c} = A_{x,s} \times R_c$$

R_c = relative correction factor for the peak corresponding to methyl 12-hydroxystearate:

$$R_c = \frac{m_{1,r} \times A_{2,r}}{A_{1,r} \times m_{2,r}}$$

R_c = 1 for peaks corresponding to each of the other specified fatty acids or any unspecified fatty acid,

$m_{1,r}$ = mass of methyl 12-hydroxystearate in the reference solution,

$m_{2,r}$ = mass of methyl stearate in the reference solution,

$A_{1,r}$ = area of any peak corresponding to methyl 12-hydroxystearate in the chromatogram obtained with the reference solution,

$A_{2,r}$ = area of any peak corresponding to methyl stearate in the chromatogram obtained with the reference solution,

$A_{x,s}$ = area of the peaks corresponding to any specified or unspecified fatty acid methyl esters.

The fatty acid fraction of the oil has the following composition:

- palmitic acid*: not more than 2.0 per cent,
- stearic acid*: 7.0 per cent to 14.0 per cent,
- arachidic acid*: not more than 1.0 per cent,
- 12-oxostearic acid* (equivalent chain length on macrogol 20 000: 22.7): not more than 5.0 per cent,
- 12-hydroxystearic acid* (equivalent chain length on macrogol 20 000: 23.9): 78.0 per cent to 91.0 per cent,
- any other fatty acid*: not more than 3.0 per cent.

Nickel (2.4.27). Not more than 1 ppm of Ni.

STORAGE

Store in a well-filled container.

IMPURITIES

A. 12-oxostearic acid.

01/2005:0051
corrected

CASTOR OIL, VIRGIN

Ricini oleum virginale

DEFINITION

Fatty oil obtained by cold expression from the seeds of *Ricinus communis* L. A suitable antioxidant may be added.

CHARACTERS

Appearance: clear, almost colourless or slightly yellow, viscous, hygroscopic liquid.

Solubility: slightly soluble in light petroleum, miscible with alcohol and with glacial acetic acid.

Relative density: about 0.958.

Refractive index: about 1.479.

IDENTIFICATION

First identification: D.

Second identification: A, B, C.

A. It complies with the test for optical rotation (see Tests).

B. It complies with the test for hydroxyl value (see Tests).

C. Iodine value (2.5.4): 82 to 90.

D. It complies with the test for composition of fatty acids (see Tests).

TESTS

Optical rotation (2.2.7): + 3.5° to + 6.0°.

Specific absorbance (2.2.25): maximum 1.0, determined at the absorption maximum at 269 nm ± 1 nm.

To 1.0 g add *alcohol R* and dilute to 100.0 ml with the same solvent.

Acid value (2.5.1): maximum 2.0.

Dissolve 5.0 g in 25 ml of the prescribed mixture of solvents.

Hydroxyl value (2.5.3, *Method A*): minimum 150.

Peroxide value (2.5.5): maximum 10.0.

Unsaponifiable matter (2.5.7): maximum 0.8 per cent, determined on 5.0 g.

Composition of fatty acids. Gas chromatography (2.4.22) with the following modifications.

Use the mixture of calibrating substances in Table 2.4.22.-3.

Test solution. Introduce 75 mg of the substance to be examined into a 10 ml centrifuge tube with a screw cap. Dissolve in 2 ml of *1,1-dimethylethyl methyl ether R1* with shaking and heat gently (50-60 °C). Add, when still warm, 1 ml of a 12 g/l solution of *sodium R* in *anhydrous methanol R*, prepared with the necessary precautions, and mix vigorously for at least 5 min. Add 5 ml of *distilled water R* and mix vigorously for about 30 s. Centrifuge for 15 min at 1500 g. Use the upper layer.

Reference solution. Dissolve 50 mg of *methyl ricinoleate CRS* and 50 mg of *methyl stearate CRS* in 10.0 ml of *1,1-dimethylethyl methyl ether R1*.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.25$ mm,
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 0.9 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 55	215
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Calculate the percentage content of each fatty acid by normalisation.

Correct the area of the peak due to methyl ricinoleate, multiplying by a factor R calculated using the following expression:

$$R = \frac{m_1 \times A_2}{A_1 \times m_2}$$

m_1 = mass of methyl ricinoleate in the reference solution,

m_2 = mass of methyl stearate in the reference solution,

A_1 = area of the peak due to methyl ricinoleate in the chromatogram obtained with the reference solution,

A_2 = area of the peak due to methyl stearate in the chromatogram obtained with the reference solution.

Composition of the fatty-acid fraction of the oil:

- *palmitic acid*: maximum 2.0 per cent,
- *stearic acid*: maximum 2.5 per cent,
- *oleic acid and isomers* (C18:1 equivalent chain length on *macrogol 20 000*: 18.3): 2.5 per cent to 6.0 per cent,
- *linoleic acid* (C18:2 equivalent chain length on *macrogol 20 000*: 18.8): 2.5 per cent to 7.0 per cent,
- *linolenic acid* (C18:3 equivalent chain length on *macrogol 20 000*: 19.2): maximum 1.0 per cent,
- *eicosenoic acid* (C20:1 equivalent chain length on *macrogol 20 000*: 20.2): maximum 1.0 per cent,
- *ricinoleic acid* (equivalent chain length on *macrogol 20 000*: 23.9): 85.0 per cent to 92.0 per cent,
- *any other fatty acid*: maximum 1.0 per cent.

Water (2.5.12): maximum 0.3 per cent, determined on 5.0 g.

STORAGE

In an airtight, well-filled container, protected from light.

LABELLING

The label states the name and concentration of any added antioxidant.

CEFACLOR

Cefaclorum

$C_{15}H_{14}ClN_3O_4S \cdot H_2O$

M_r 385.8

DEFINITION

Cefaclor is the monohydrate of (6*R*,7*R*)-7-[[*(2R*)-2-amino-2-phenylacetyl]amino]-3-chloro-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid. It contains not

less than 96.0 per cent and not more than the equivalent of 102.0 per cent of $C_{15}H_{14}ClN_3O_4S$, calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellow powder, slightly soluble in water, practically insoluble in methanol and in methylene chloride.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cefaclor CRS*.

TESTS

pH (2.2.3). Suspend 0.250 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the suspension is 3.0 to 4.5.

Specific optical rotation (2.2.7). Dissolve 0.250 g in a 10 g/l solution of *hydrochloric acid R* and dilute to 25.0 ml with the same solution. The specific optical rotation is + 101 to + 111, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in 10.0 ml of a 2.7 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 2.5 with *phosphoric acid R*.

Reference solution (a). Dissolve 2.5 mg of *cefaclor CRS* and 5.0 mg of *delta-3-cefaclor CRS* in 100.0 ml of a 2.7 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 2.5 with *phosphoric acid R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a 2.7 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 2.5 with *phosphoric acid R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Adjust a 7.8 g/l solution of *sodium dihydrogen phosphate R* to pH 4.0 with *phosphoric acid R*,

Mobile phase B. Mix 450 ml of *acetonitrile R* with 550 ml of mobile phase A,

- as detector a spectrophotometer set at 220 nm,
- a 20 µl loop injector.

Equilibrate the column with a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A for at least 15 min between each analysis. Inject the solutions. Operate by gradient elution increasing the concentration of mobile phase B continuously and linearly by 0.67 per cent V/V per minute for 30 min (25 per cent V/V). Then increase the concentration of mobile phase B continuously and linearly by 5 per cent V/V per minute for 15 min (100 per cent V/V). Finally elute with mobile phase B for 10 min. Change the composition to a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A to re-equilibrate the column.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to cefaclor and delta-3-cefaclor is at least 2 and the symmetry factor of the cefaclor peak is at most 1.2. If necessary, adjust the acetonitrile content of the mobile phase.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak and any peaks due to the mobile phase, is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); and the sum of all such peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 1.0 g complies with limit test C (30 ppm). Prepare the standard using 3 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12). 3.0 per cent to 6.5 per cent, determined on 0.200 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 15.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 15.0 mg of *cefaclor CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 15.0 mg of *cefaclor CRS* and 15.0 mg of *delta-3-cefaclor CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture prepared by adding 220 ml of *methanol R* to a mixture of 780 ml of *water R*, 10 ml of *triethylamine R* and 1 g of *sodium pentanesulphonate R*, adjusted to pH 2.5 with *phosphoric acid R*,
- as detector a spectrophotometer set at 265 nm,
- a 20 µl loop injector.

Inject reference solution (b). The assay is not valid unless the resolution between the peaks due to cefaclor and delta-3-cefaclor is at least 2.5. Adjust the concentration of methanol in the mobile phase, if necessary. The assay is not valid unless the symmetry factor of the cefaclor peak is at most 1.5. Inject reference solution (a) six times. The assay is not valid unless the relative standard deviation of the peak area of cefaclor is at most 1.0 per cent. Inject alternately the test solution and reference solution (a).

IMPURITIES

 $C_{16}H_{17}N_3O_5S \cdot H_2O$
 M_r 381.4

DEFINITION

(6*R*,7*R*)-7-[[*(2R)*-2-Amino-2-(4-hydroxyphenyl)acetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate.

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: slightly soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

TESTS

pH (2.2.3): 4.0 to 6.0.

Suspend 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Specific optical rotation (2.2.7): + 165 to + 178 (anhydrous substance).

Dissolve 0.500 g in *water R* and dilute to 50.0 ml with the same solvent.

Absorbance (2.2.25). Dissolve 20.0 mg in *phosphate buffer solution pH 6.0 R* and dilute to 100.0 ml with the same solvent. The absorbance of the solution determined at 330 nm is not greater than 0.05. Dilute 10.0 ml of the solution to 100.0 ml with *phosphate buffer solution pH 6.0 R*. Examined between 235 nm and 340 nm, the diluted solution shows an absorption maximum at 264 nm. The specific absorbance at this maximum is 225 to 250 (anhydrous substance).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). Dissolve 10.0 mg of *D-α-(4-hydroxyphenyl)glycine CRS* (impurity A) in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 10.0 mg of *7-aminodesacetoxycephalosporanic acid CRS* (impurity B) in *phosphate buffer solution pH 7.0 R5* and dilute to 10.0 ml with the same buffer solution.

Reference solution (c). Dilute 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 100.0 ml with mobile phase A.

Reference solution (d). Dissolve 10 mg of *dimethylformamide R* and 10 mg of *dimethylacetamide R* in mobile phase A and dilute to 10.0 ml with mobile phase A. Dilute 1.0 ml to 100.0 ml with mobile phase A.

Reference solution (e). Dilute 1.0 ml of reference solution (c) to 25.0 ml with mobile phase A.

Column:

- **size:** $l = 0.10$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** spherical *octadecylsilyl silica gel for chromatography R* (5 μ m).

Mobile phase:

- **mobile phase A:** *phosphate buffer solution pH 5.0 R*,
- **mobile phase B:** *methanol R2*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 1	98	2
1 - 20	98 $\rightarrow$ 70	2 $\rightarrow$ 30
20 - 23	70 $\rightarrow$ 98	30 $\rightarrow$ 2
23 - 30	98	2

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 μ l; inject the test solution and reference solutions (c), (d) and (e).

Relative retention with reference to cefadroxil (retention time = about 6 min): *dimethylformamide* = about 0.4; *dimethylacetamide* = about 0.75.

System suitability:

- **resolution:** minimum 5.0 between the peaks due to impurity A and to impurity B in the chromatogram obtained with reference solution (c),
- **signal-to-noise ratio:** minimum 10 for the second peak in the chromatogram obtained with reference solution (e).

Limits:

- **impurity A:** not more than the area of the first peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- **any other impurity:** not more than the area of the second peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- **total:** not more than 3 times the area of the second peak in the chromatogram obtained with reference solution (c) (3.0 per cent),
- **disregard limit:** 0.05 times the area of the second peak in the chromatogram obtained with reference solution (c) (0.05 per cent); disregard the peaks due to *dimethylformamide* and *dimethylacetamide*.

***N,N*-Dimethylaniline (2.4.26, Method B):** maximum 20 ppm.

Water (2.5.12): 4.0 per cent to 6.0 per cent, determined on 0.200 g.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *cefadroxil CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *cefadroxil CRS* and 50 mg of *amoxicillin trihydrate CRS* in the mobile phase and dilute to 100 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *octadecylsilyl silica gel for chromatography R* (5 μ m).

Mobile phase: *acetonitrile R*, a 2.72 g/l solution of *potassium dihydrogen phosphate R* (4:96 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l.

System suitability: reference solution (b):

- **resolution:** minimum 5.0 between the peaks due to cefadroxil and to amoxicillin.

Calculate the percentage content of cefadroxil.

STORAGE

Protected from light.

IMPURITIES

A. (2*R*)-2-amino-2-(4-hydroxyphenyl)acetic acid,

CEFALEXIN MONOHYDRATE

Cefalexinum monohydricum

$C_{16}H_{17}N_3O_4S \cdot H_2O$

M_r 365.4

DEFINITION

(6*R*,7*R*)-7-[[[(2*R*)-2-Amino-2-phenylacetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate.

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: sparingly soluble in water, practically insoluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: cefalexin monohydrate CRS.

TESTS

pH (2.2.3): 4.0 to 5.5.

Dissolve 50 mg in carbon dioxide-free water *R* and dilute to 10 ml with the same solvent.

Specific optical rotation (2.2.7): + 149 to + 158 (anhydrous substance).

Dissolve 0.125 g in phthalate buffer solution pH 4.4 *R* and dilute to 25.0 ml with the same solvent.

Absorbance (2.2.25). Dissolve 50 mg in water *R* and dilute to 100.0 ml with the same solvent. The absorbance of the solution determined at 330 nm is not greater than 0.05. Dilute 2.0 ml of the solution to 50.0 ml with water *R*. Examined between 220 nm and 300 nm, the diluted solution shows an absorption maximum at 262 nm. The specific absorbance at this maximum is 220 to 245, calculated with reference to the anhydrous substance.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). Dissolve 10.0 mg of *D*-phenylglycine *R* in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 10.0 mg of 7-aminodesacetoxycephalosporanic acid CRS in phosphate buffer solution pH 7.0 *R5* and dilute to 10.0 ml with mobile phase A.

Reference solution (c). Dilute 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 100.0 ml with mobile phase A.

Reference solution (d). Dissolve 10 mg of dimethylformamide *R* and 10 mg of dimethylacetamide *R* in mobile phase A and dilute to 10.0 ml with mobile phase A. Dilute 1.0 ml to 100.0 ml with mobile phase A.

Reference solution (e). Dilute 1.0 ml of reference solution (c) to 20.0 ml with mobile phase A.

Reference solution (f). Dissolve 10 mg of cefotaxime sodium CRS in mobile phase A and dilute to 10.0 ml with mobile phase A. To 1.0 ml of the solution add 1.0 ml of the test solution and dilute to 100 ml with mobile phase A.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- stationary phase: spherical octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase:

- mobile phase A: phosphate buffer solution pH 5.0 *R*,
- mobile phase B: methanol *R2*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 1	98	2
1 - 20	98 $\rightarrow$ 70	2 $\rightarrow$ 30
20 - 23	70 $\rightarrow$ 98	30 $\rightarrow$ 2
23 - 30	98	2

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 μ l; inject the test solution and reference solutions (c), (d), (e) and (f).

System suitability:

- **resolution:** minimum of 2.0 between the peaks due to impurity A and to impurity B in the chromatogram obtained with reference solution (c) and minimum of 1.5 between the peaks due to cefalexin and to cefotaxime in the chromatogram obtained with reference solution (f).

Limits:

- **impurity B:** not more than the area of the second peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- **any other impurity** (disregard the peaks due to dimethylformamide and dimethylacetamide): not more than the area of the first peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- **total:** not more than 3 times the area of the first peak in the chromatogram obtained with reference solution (c) (3.0 per cent),
- **disregard limit:** the area of the second peak in the chromatogram obtained with reference solution (e) (0.05 per cent).

N,N-Dimethylaniline (2.4.26, *Method B*): maximum 20 ppm.

Water (2.5.12): 4.0 per cent to 8.0 per cent, determined on 0.300 g.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *cefalexin monohydrate CRS* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *cefradine CRS* in 20 ml of reference solution (a) and dilute to 100 ml with *water R*.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: *methanol R*, *acetonitrile R*, a 13.6 g/l solution of *potassium dihydrogen phosphate R*, *water R* (2:5:10:83 *V/V/V/V*).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l.

System suitability: reference solution (b):

- **resolution:** minimum 4.0 between the peaks due to cefalexin and to cefradine.

Calculate the percentage content of cefalexin monohydrate.

STORAGE

Protected from light.

IMPURITIES

A. (2*R*)-2-amino-2-phenylacetic acid (D-phenylglycine),

B. (6*R*,7*R*)-7-amino-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (7-aminodesacetoxycephalosporanic acid, 7-ADCA),

C. (6*R*,7*R*)-7-[(2*R*)-2-[(2*R*)-2-amino-2-phenylacetyl]amino]-2-phenylacetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,

D. 3-hydroxy-4-methylthiophen-2(5*H*)-one,

E. (6*R*,7*R*)-7-[(2,2-dimethylpropanoyl)amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (7-ADCA pivalamide),

F. (2*RS*,6*R*,7*R*)-7-[(2*R*)-2-amino-2-phenylacetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-3-ene-2-carboxylic acid (delta-2-cefalexin).

01/2005:0987

CEFALOTIN SODIUM**Cefalotinum natricum**

$C_{16}H_{15}N_2NaO_6S_2$

M_r 418.4

DEFINITION

Cefalotin sodium contains not less than 96.0 per cent and not more than the equivalent of 101.0 per cent of sodium (6*R*, 7*R*)-3-[(acetyloxy)methyl]-8-oxo-7-[[2-(thiophen-2-yl)acetyl]-amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, freely soluble in water, slightly soluble in ethanol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cefalotin sodium CRS*.
- B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). The absorbance (2.2.25) of solution S measured at 450 nm is not greater than 0.20.

pH (2.2.3). The pH of solution S is 4.5 to 7.0.

Specific optical rotation (2.2.7). Dissolve 1.25 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 124 to + 134, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject the test solution and reference solution (b). Continue the chromatography for at least four times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent) and the sum of the areas of any such peaks is not greater than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

***N,N*-Dimethylaniline (2.4.26, Method B).** Not more than 20 ppm.

2-Ethylhexanoic acid (2.4.28). Not more than 0.5 per cent *m/m*.

Water (2.5.12). Not more than 1.5 per cent, determined on 0.500 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.13 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *cefalotin sodium CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Heat 5 ml of reference solution (a) in a water-bath at 90 °C for 10 min. Cool and inject immediately.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
 - as mobile phase at a flow rate of 1.0 ml/min a solution prepared as follows: dissolve 17 g of *sodium acetate R* in 790 ml of *water R*, add 0.6 ml of *glacial acetic acid R* and adjust if necessary to pH 5.8 to 6.0 with *dilute sodium hydroxide solution R* or *glacial acetic acid R*, add 150 ml of *acetonitrile R* and 70 ml of *ethanol R* and mix,
 - as detector a spectrophotometer set at 254 nm,
 - a 10 µl loop injector,
- maintaining the temperature of the column at 40 °C.

Inject reference solution (c). Adjust the sensitivity of the system to obtain peaks with a height corresponding to at least half the full scale of the recorder. The chromatogram obtained shows two principal peaks corresponding to cefalotin and desacetylcefalotin. The assay is not valid unless the resolution between these two peaks is at least 9.0. Adjust the concentration of acetonitrile in the mobile phase if necessary. The assay is not valid unless the symmetry factor of the cefalotin peak is at most 1.8. Inject reference solution (a) six times. The assay is not valid unless the relative standard deviation of the peak area for cefalotin is at most 1.0 per cent. Inject alternately the test solution and reference solution (a).

Calculate the percentage content of cefalotin sodium.

STORAGE

Store in an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. (6*R*,7*R*)-3-methyl-8-oxo-7-[[2-(thiophen-2-yl)acetyl]amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (desacetoxycefalotin).

CEFAMANDOLE NAFATE

Cefamandoli nafas

C₁₉H₁₇N₆NaO₆S₂

*M*_r 512.5

DEFINITION

Sodium (6*R*,7*R*)-7-[[*(2R)*-2-(formyloxy)-2-phenylacetyl]amino]-3-[[*(1-methyl-1*H*-tetrazol-5-yl)sulphonyl* methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate with sodium carbonate.

Content:

- cefamandole (C₁₈H₁₈N₆O₅S₂): 84.0 per cent to 93.0 per cent (anhydrous and sodium carbonate-free substance),
- sodium carbonate (Na₂CO₃): 4.8 per cent to 6.4 per cent.

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, sparingly soluble in methanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: cefamandole nafate CRS.

B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in carbon dioxide-free water *R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and its absorbance (2.2.25) at 475 nm has a maximum of 0.03.

pH: 6.0 to 8.0 for solution S, measured after 30 min.

Specific optical rotation (2.2.7): –25.0 to –33.0 (anhydrous and sodium carbonate-free substance).

Dissolve 1.00 g in acetate buffer solution pH 4.7 *R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Solvent mixture. Mix 18 volumes of acetonitrile *R* and 75 volumes of a 10 per cent V/V solution of triethylamine *R* previously adjusted to pH 2.5 with phosphoric acid *R*.

Test solution. Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with the solvent mixture, then heat the solution at 60 °C for 30 min.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Column:

- size: *l* = 0.25 m, Ø = 4.6 mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase:

- triethylamine phosphate solution: dissolve 2.0 g of sodium pentanesulphonate *R* in 350 ml of water *R*, add 40 ml of triethylamine *R*, adjust to pH 2.5 with phosphoric acid *R* and dilute to 700 ml with water *R*,
- mobile phase A: mix 1 volume of triethylamine phosphate solution and 2 volumes of water *R*,
- mobile phase B: mix equal volumes of triethylamine phosphate solution, methanol *R* and acetonitrile *R*.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 1	100	0
1 - 35	100 → 0	0 → 100
35 - 45	0	100
45 - 50	0 → 100	100 → 0

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl loop injector.

System suitability: reference solution (a):

- resolution: minimum 5.0 between the peaks due to cefamandole and to cefamandole nafate.

Limits:

- any impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),
- total: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent),
- disregard limit: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Cefamandole free acid: maximum 9.5 per cent (anhydrous and sodium carbonate-free substance), determined by liquid chromatography as described under Assay.

2-Ethylhexanoic acid (2.4.28): maximum 0.3 per cent *m/m*.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) *R*.

Water (2.5.12): maximum 2.0 per cent, determined on 0.500 g.

Bacterial endotoxins (2.6.14): less than 0.15 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Cefamandole. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of cefamandole nafate CRS in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of the test solution to 10 ml with the mobile phase, then heat the solution at 60 °C for 30 min.

Column:

- size: *l* = 0.25 m, Ø = 4.6 mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: mix 25 volumes of acetonitrile *R* and 75 volumes of a 10 per cent V/V solution of triethylamine *R* previously adjusted to pH 2.5 with phosphoric acid *R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl loop injector.

System suitability:

- resolution: minimum of 7.0 between the 2 principal peaks in the chromatogram obtained with reference solution (b),

- *repeatability*: maximum relative standard deviation of 0.8 per cent after a series of single injections of a minimum 3 freshly prepared reference solutions (a).

Calculate the percentage content of cefamandole ($C_{18}H_{18}N_6O_5S_2$) from the sum of the contents of cefamandole nafate and cefamandole free acid using the declared contents of *cefamandole nafate CRS*. 1 mg of cefamandole nafate is equivalent to 0.9025 mg of cefamandole.

Sodium carbonate. Dissolve 0.500 g in 50 ml of *water R*. Titrate with 0.1 M *hydrochloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *hydrochloric acid* is equivalent to 10.6 mg of Na_2CO_3 .

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- that the substance contains sodium carbonate,
- where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. (6*R*,7*R*)-7-[[[(2*R*)-2-(formyloxy)-2-phenylacetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (formylmandeloyl-7-amino-desacetoxy-cephalosporanic acid),

- B. R = H: (6*R*,7*R*)-7-[[[(2*R*)-2-hydroxy-2-phenylacetyl]amino]-3-[[[(1-methyl-1*H*-tetrazol-5-yl)sulphonyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (cefamandole),
- C. R = CO-H₃C: (6*R*,7*R*)-7-[[[(2*R*)-2-(acetyloxy)-2-phenylacetyl]amino]-3-[[[(1-methyl-1*H*-tetrazol-5-yl)sulphonyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (*O*-acetylcefamandole),

- D. 1-methyl-1*H*-tetrazole-5-thiol,

- E. (6*R*,7*R*)-7-[[[(2*R*)-2-(formyloxy)-2-phenylacetyl]amino]-3-[(acetyloxy)methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (formylmandeloyl-7-ACA).

01/2005:1650

CEFAPIRIN SODIUM

Cefapirinum natriicum

$C_{17}H_{16}N_3NaO_6S_2$

M_r 445.5

DEFINITION

Sodium (6*R*,7*R*)-3-[(acetyloxy)methyl]-8-oxo-7-[[[(pyridin-4-yl)sulphonyl]acetyl]amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate.

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or pale yellow powder.

Solubility: soluble in water, practically insoluble in methylene chloride.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *cefapirin sodium CRS*.

- B. It gives reaction (a) of sodium (2.3.1).

TESTS

Appearance of solution. Dissolve 2.0 g in *water R* and dilute to 10.0 ml with the same solvent. The solution is clear (2.2.1). Dilute 5.0 ml to 10.0 ml with *water R*. The absorbance (2.2.25) of this solution at 450 nm is maximum 0.25.

pH (2.2.3): 6.5 to 8.5.

Dissolve 0.100 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Specific optical rotation (2.2.7): + 150 to + 165 (anhydrous substance).

Dissolve 0.500 g in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use.

Test solution. Dissolve 42 mg of the substance to be examined in the mobile phase and dilute to 200.0 ml with the mobile phase.

Reference solution (a). Dissolve 42 mg of *cefapirin sodium CRS* in the mobile phase and dilute to 200.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 20.0 ml with the mobile phase.

Reference solution (d). Mix 1 ml of the test solution, 8 ml of the mobile phase and 1 ml of *hydrochloric acid R1*. Heat at 60 °C for 10 min.

Column:

- **size:** $l = 0.30$ m, $\varnothing = 4$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (10 μ m).

Mobile phase: mix 80 ml of *dimethylformamide R*, 4.0 ml of *glacial acetic acid R* and 20 ml of a 4.5 per cent (*m/m*) solution of *potassium hydroxide R*. Dilute to 2 litres with *water R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l of the test solution and reference solutions (b), (c) and (d).

Run time: twice the retention time of cefapirin.

Relative retention with reference to cefapirin (retention time = about 13 min): impurity B = about 0.3; impurity C = about 0.5; impurity A = about 0.75.

System suitability: reference solution (d):

- **resolution:** minimum 2.0 between the peaks due to cefapirin and impurity A.

Limits:

- **any impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), and not more than 1 such peak has an area greater than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

***N,N*-Dimethylaniline** (2.4.26, *Method B*): maximum 20 ppm.

2-Ethylhexanoic acid (2.4.28): maximum 0.5 per cent.

Water (2.5.12): maximum 2.0 per cent, determined on 0.300 g.

Bacterial endotoxins (2.6.14): less than 0.17 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{17}H_{16}N_3NaO_6S_2$.

STORAGE

Protected from light. If the substance is sterile, store in a sterile, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

Specified impurities: A, B, C.

A. (5a*R*,6*R*)-6-[[[(pyridin-4-yl)sulphonyl]acetyl]amino]-5a,6-dihydro-3*H*,7*H*-azeto[2,1-*b*]furo[3,4-*d*][1,3]thiazine-1,7(4*H*)-dione (deacetylcefapirin lactone),

B. R = OH: (6*R*,7*R*)-3-(hydroxymethyl)-8-oxo-7-[[[(pyridin-4-yl)sulphonyl]acetyl]amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (deacetylcefapirin),

C. R = H: (6*R*,7*R*)-3-methyl-8-oxo-7-[[[(pyridin-4-yl)sulphonyl]acetyl]amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (deacetoxycefapirin).

01/2005:1403

CEFATRIZINE PROPYLENE GLYCOL

Cefatrizinum propylen glycolum

$C_{18}H_{18}N_6O_5S_2 \cdot (C_3H_8O_2)_n$

M_r 462.5 (base)

DEFINITION

Cefatrizine propylene glycol contains not less than 95.0 per cent and not more than the equivalent of 102.0 per cent of (6*R*,7*R*)-7-[[[(2*R*)-2-amino-2-(4-hydroxyphenyl)acetyl]amino]-8-oxo-3-[[[(1*H*-1,2,3-triazol-4-yl)sulphonyl]methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, calculated with reference to the anhydrous and propylene glycol free substance. It consists of cefatrizine and propane-1,2-diol (molecular proportions about 1:1). It contains not less than 13.0 per cent and not more than 18.0 per cent of propylene glycol.

CHARACTERS

A white or almost white powder, slightly soluble in water, practically insoluble in alcohol and in methylene chloride.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cefatrizine propylene glycol CRS*.
- Examine the chromatograms obtained in the test for propylene glycol. The retention time and size of the principal peak in the chromatogram obtained with the

test solution are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (b).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.400 g of the substance to be examined in 1 M hydrochloric acid and dilute to 20.0 ml with the same solvent. The specific optical rotation is + 63 to + 69, calculated with reference to the anhydrous, propylene glycol free substance.

Propylene glycol. 13.0 per cent to 18.0 per cent, determined by gas chromatography (2.2.28), using dimethylacetamide R as the internal standard.

Internal standard solution. Dissolve 1.0 g of dimethylacetamide R in a mixture of 20 volumes of acetone R and 80 volumes of water R, and dilute to 50.0 ml with the same mixture of solvents.

Test solution. Introduce 0.40 g of the substance to be examined into a ground-glass-stoppered test tube. Add 3.0 ml of the internal standard solution, 1.0 ml of a mixture of 20 volumes of acetone R and 80 volumes of water R and 2.0 ml of hydrochloric acid R. Seal the test tube and stir the solution.

Reference solution (a). Dissolve 2.0 g of propylene glycol R in a mixture of 20 volumes of acetone R and 80 volumes of water R and dilute to 100.0 ml with the same solvent.

Reference solution (b). Introduce into a ground-glass-stoppered test tube 1.0 ml of reference solution (a) and 1.0 ml of the internal standard solution.

The chromatographic procedure may be carried out using:

- a stainless steel column 2 m long and 2 mm in internal diameter packed with ethylvinylbenzene-divinylbenzene copolymer R (150-180 µm),
- nitrogen for chromatography R as the carrier gas at a flow rate of about 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 200 °C and that of the injection port and of the detector at 250 °C.

Inject separately 1 µl of the test solution and 1 µl of reference solution (b).

7-ACA triazole and other related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Adjust the sensitivity of the system so that the height of the principal peak obtained with 20 µl of reference solution (c) is at least 50 per cent of the full scale of the recorder. Inject 20 µl of the test solution and continue the chromatography for at least twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak corresponding to cefatrizine impurity A is not greater than that of the peak due to cefatrizine impurity A in the chromatogram obtained with reference solution (d) (0.5 per cent); the area of any peak apart from the principal peak and any peak corresponding to cefatrizine impurity A is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.6 per cent); the sum of the areas of any such peaks is not greater than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (2.1 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (c).

Water (2.5.12). Not more than 1.5 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 60.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 60.0 mg of cefatrizine propylene glycol CRS in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 30.0 mg of cefatrizine impurity A CRS in buffer solution pH 7.0 R and dilute to 100.0 ml with the same buffer solution.

Reference solution (c). Dilute 0.6 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 100.0 ml with buffer solution pH 7.0 R.

Reference solution (e). To 1.0 ml of reference solution (a) add 1.0 ml of reference solution (b) and dilute to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with octadecylsilyl silica gel for chromatography R (5 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 5 volumes of acetonitrile R and 95 volumes of a 2.72 g/l solution of potassium dihydrogen phosphate R in water R,
- as detector a spectrophotometer set at 272 nm.

Adjust the sensitivity of the system so that the height of the principal peak obtained with 20 µl of reference solution (a) is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (a) six times. The test is not valid unless the relative standard deviation is at most 1.0 per cent. Inject reference solution (e). The test is not valid unless the resolution between the peaks corresponding to cefatrizine and cefatrizine impurity A is at least 5.0.

Inject alternately 20 µl of the test solution and 20 µl of reference solution (a) and calculate the percentage content of cefatrizine using the chromatogram obtained with reference solution (a).

IMPURITIES

- A. (6R,7R)-7-amino-8-oxo-3-[(1H-1,2,3-triazol-4-yl)sulphanyl]methyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (7-ACA triazole).

01/2005:0988

CEFAZOLIN SODIUM

Cefazolinum natricum

 $C_{14}H_{13}N_8NaO_4S_3$ M_r 476.5

DEFINITION

Sodium (6*R*,7*R*)-3-[[[(5-methyl-1,3,4-thiadiazol-2-yl)sulphanyl]methyl]-8-oxo-7-[(1*H*-tetrazol-1-ylacetyl)amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate.

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder, very hygroscopic.

Solubility: freely soluble in water, very slightly soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: dissolve 0.150 g in 5 ml of *water R*, add 0.5 ml of *dilute acetic acid R*, swirl and allow to stand for 10 min in iced water. Filter the precipitate and rinse with 1-2 ml of *water R*. Dissolve in a mixture of 1 volume of *water R* and 9 volumes of *acetone R*. Evaporate the solvent almost to dryness, then dry in an oven at 60 °C for 30 min.

Comparison: *cefazolin CRS*.

B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and its absorbance (2.2.25) at 430 nm has a maximum of 0.15.

pH (2.2.3): 4.0 to 6.0 for solution S.

Specific optical rotation (2.2.7): -15 to -24 (anhydrous substance).

Dissolve 1.25 g in *water R* and dilute to 25.0 ml with the same solvent.

Absorbance (2.2.25). Dissolve 0.100 g in *water R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *sodium hydrogen carbonate solution R*. Examined between 220 nm and 350 nm, the solution shows an absorption maximum at 272 nm. The specific absorbance at the maximum is 260 to 300 (anhydrous substance).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in mobile phase A and dilute to 20.0 ml with the same mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 20 mg of the substance to be examined in 10 ml of a 2 g/l solution of *sodium hydroxide R*. Allow to stand for 15-30 min. Dilute 1.0 ml of the solution to 20 ml with mobile phase A.

Column:

- *size*: $l = 0.125$ m, $\varnothing = 4.0$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography *R* (3 μ m),
- *temperature*: 45 °C.

Mobile phase:

- *mobile phase A*: solution containing 14.54 g/l of *disodium hydrogen phosphate R* and 3.53 g/l of *potassium dihydrogen phosphate R*,
- *mobile phase B*: *acetonitrile for chromatography R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	λ (nm)
0 - 1	98	2	210
1 - 2	98	2	254
2 - 4	98 → 85	2 → 15	254
4 - 10	85 → 60	15 → 40	254
10 - 11.5	60 → 35	40 → 65	254
11.5 - 12	35	65	254
12 - 15	35 → 98	65 → 2	254
15 - 16	98	2	254
16 - 21	98	2	210

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 210 nm and at 254 nm (see table above).

Injection: 5 μ l.

System suitability: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to cefazolin and to impurity I (see Figure 0988-1).

Limits:

- *any impurity* (seen at 210 nm or 254 nm): not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *total*: not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.5 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

***N,N*-Dimethylaniline** (2.4.26, *Method B*): maximum 20 ppm.

Water (2.5.12): maximum 6.0 per cent, determined on 0.300 g.

Bacterial endotoxins (2.6.14): less than 0.15 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *cefazolin CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *cefuroxime sodium CRS* in 10.0 ml of reference solution (a) and dilute to 100.0 ml with the mobile phase.

Figure 0988.-1. – Chromatogram of reference solution (b) (in situ degradation) for the test for related substances of cefazolin sodium

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: mix 10 volumes of acetonitrile R and 90 volumes of a solution containing 2.77 g/l of disodium hydrogen phosphate R and 1.86 g/l of citric acid R .

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 20 μ l.

System suitability: reference solution (b):

- resolution: minimum 2.0 between the peaks due to cefazolin and cefuroxime.

Calculate the percentage content of cefazolin sodium by multiplying the percentage content of cefazolin by 1.048.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. R = H: (6*R*,7*R*)-7-amino-3-[[[(5-methyl-1,3,4-thiadiazol-2-yl)sulphonyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,

(6*R*,7*R*)-3-[(5-methyl-1,3,4-thiadiazol-2-yl)sulphonyl]methyl]-8-oxo-7-[(1*H*-tetrazol-1-ylacetyl)amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxamide (cefazolinamide).

CEFIXIME

Cefiximum

 $C_{16}H_{15}N_5O_7S_2 \cdot 3H_2O$ M_r 507.5

DEFINITION

Cefixime is (6*R*,7*R*)-7-[(*Z*)-2-(2-aminothiazol-4-yl)-2-[(carboxymethoxy)imino]acetyl]amino]-3-ethenyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid trihydrate. It contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of $C_{16}H_{15}N_5O_7S_2$, calculated with reference to the anhydrous and ethanol-free substance.

CHARACTERS

A white or almost white powder, slightly hygroscopic, slightly soluble in water, soluble in methanol, sparingly soluble in ethanol, practically insoluble in ethyl acetate.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cefixime CRS*. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

TESTS

pH (2.2.3). Suspend 0.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the suspension is 2.6 to 4.1.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject the test solution and continue the chromatography for 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b).

Ethanol (2.4.24). Not more than 1.0 per cent *m/m*, determined by head-space gas chromatography (2.2.28), using the standard additions method.

Sample solution. Dissolve 0.250 g of the substance to be examined in a mixture of 1 volume of *dimethylacetamide R* and 4 volumes of *water R* and dilute to 25.0 ml with the same mixture of solvents.

Water (2.5.12): 9.0 per cent to 12.0 per cent, determined on 0.200 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *cefixime CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of *cefixime CRS* in 10 ml of *water R*. Heat on a water-bath for 45 min. Cool and inject immediately.

The chromatographic procedure may be carried out using:

- a column 0.125 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 250 volumes of *acetonitrile R* and 750 volumes of a tetrabutylammonium hydroxide solution prepared as follows: dissolve 8.2 g of *tetrabutylammonium hydroxide R* in *water R* and dilute to 800 ml with the same solvent; adjust to pH 6.5 with *dilute phosphoric acid R* and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 254 nm,
- a 10 µl loop injector,

maintaining the temperature of the column at 40 °C.

Inject reference solution (c). Adjust the sensitivity of the system so that the heights of the principal peaks are at least 20 per cent of the full scale of the recorder. The test is not valid unless the resolution between the 2 principal peaks (*cefixime* and *E*-isomer) is at least 2.0. If necessary, adjust the concentration of acetonitrile in the mobile phase. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the peak area for *cefixime* is at most 1.0 per cent. Inject alternately the test solution and reference solution (a).

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. R = CO₂H: 2-[[[(Z)-2-(2-aminothiazol-4-yl)-2-[(carboxymethoxy)imino]acetyl]amino]-2-[(2R)-5-methyl-7-oxo-1,2,5,7-tetrahydro-4H-furo[3,4-d][1,3]thiazin-2-yl]acetic acid,

- E. R = H, R' = CH₃: (6*R*,7*R*)-7-[[[(*Z*)-2-(2-aminothiazol-4-yl)-2-[(carboxymethoxy)imino]acetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,

- F. R = C₂H₅, R' = CH=CH₂: (6*R*,7*R*)-7-[[[(*Z*)-2-(2-aminothiazol-4-yl)-2-[(2-ethoxy-2-oxoethoxy)imino]acetyl]amino]-3-ethenyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid.

01/2005:1404

CEFOPERAZONE SODIUM

Cefoperazonum natricum

C₂₅H₂₆N₉NaO₈S₂

*M*_r 668

DEFINITION

Cefoperazone sodium contains not less than 95.0 per cent and not more than the equivalent of 102.0 per cent of sodium (6*R*,7*R*)-7-[[[(2*R*)-2-[[[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-(4-hydroxyphenyl)acetyl]amino]-3-[[[(1-methyl-1*H*-tetrazol-5-yl)sulphonyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate, calculated with reference to the anhydrous and acetone-free substance.

CHARACTERS

A white or slightly yellow powder, hygroscopic, freely soluble in water, soluble in methanol, slightly soluble in alcohol.

If crystalline, it shows polymorphism.

IDENTIFICATION

- A. Dissolve the substance to be examined in *methanol R* and evaporate to dryness. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of cefoperazone sodium*.
- B. Examine the chromatograms obtained in the assay. The retention time and size of the principal peak in the chromatogram obtained with test solution (a) are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (a).
- C. It gives reaction (a) of sodium (2.3.1).

TESTS

Appearance of solution. Dissolve 2.5 g in *water R* and dilute to 25.0 ml with the same solvent. The solution is clear (2.2.1). The absorbance of the solution measured at 430 nm (2.2.25) is not greater than 0.15.

pH (2.2.3). Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 4.5 to 6.5.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay. Inject 20 µl of reference solution (b) and adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of test solution (b). Continue the chromatography for at least 2.5 times the retention time of the principal peak. In the chromatogram obtained with test solution (b): the area of any peak, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent); the sum of the areas of any such peaks is not greater than 4.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (4.5 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Acetone. Not more than 2.0 per cent, determined by head-space gas chromatography (2.2.28), using the method of standard additions.

Sample solution. Dissolve 0.500 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Solvent solution. Dissolve 0.350 g of *acetone R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *water R*.

Prepare each of 4 injection vials as shown in the table below:

Vial No.	Sample solution (ml)	Solvent solution (ml)	Water R (ml)
1	1.0	0	4.0
2	1.0	1.0	3.0
3	1.0	2.0	2.0
4	1.0	3.0	1.0

The chromatographic procedure may be carried out using system B of the test for residual solvents (2.4.24) and the following static head-space injection conditions:

- equilibration time: 15 min,

- transfer-line temperature: 110 °C,

maintaining the temperature of the column at 40 °C for 10 min.

Heavy metals (2.4.8). 2.0 g complies with limit test C (5 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 5.0 per cent, determined on 0.200 g.

Bacterial endotoxins (2.6.14): less than 0.20 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution (a). Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 250.0 ml with the mobile phase.

Test solution (b). Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *cefoperazone dihydrate CRS* in the mobile phase and dilute to 250.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 884 volumes of *water R*; 110 volumes of *acetonitrile R*; 3.5 volumes of a 60 g/l solution of *acetic acid R*; 2.5 volumes of a triethylammonium acetate solution prepared by diluting 14 ml of *triethylamine R* and 5.7 ml of *glacial acetic acid R* to 100 ml with *water R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention time is about 15 min for cefoperazone. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained with reference solution (a), the number of theoretical plates calculated for the principal peak is at least 5000 and its symmetry factor is at most 1.6. If necessary adjust the content of *acetonitrile R* in the mobile phase. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the peak area is at most 1.0 per cent. Inject alternately test solution (a) and reference solution (a).

Calculate the percentage content of cefoperazone sodium by multiplying the percentage content of cefoperazone by 1.034.

STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. (5a*R*,6*R*)-6-[[[(2*R*)-2-[[[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-(4-hydroxyphenyl)acetyl]amino]-5a,6-dihydro-3*H*,7*H*-azeto[2,1-*b*]furo[3,4-*d*][1,3]thiazine-1,7(4*H*)-dione,

- B. (6*R*,7*R*)-7-[[[(2*R*)-2-[[[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-(4-hydroxyphenyl)acetyl]amino]-3-[(4-methyl-5-thioxo-4,5-dihydro-1*H*-tetrazol-1-yl)methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,

M_r 477.4

DEFINITION

Cefotaxime sodium contains not less than 96.0 per cent and not more than the equivalent of 101.0 per cent of sodium (6*R*,7*R*)-3-[(acetyloxy)methyl]-7-[[[(*Z*)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellow powder, hygroscopic, freely soluble in water, sparingly soluble in methanol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cefotaxime sodium CRS*.

- B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). Add 1 ml of *glacial acetic acid R* to 10 ml of solution S. The solution, examined immediately, is clear. The absorbance (2.2.25) of solution S measured at 430 nm is not greater than 0.20.

pH (2.2.3). The pH of solution S is 4.5 to 6.5.

Specific optical rotation (2.2.7). Dissolve 0.100 g in *water R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is + 58 to + 64, calculated with reference to the dried substance.

Absorbance (2.2.25). Dissolve 20.0 mg in *water R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *water R*. The specific absorbance determined at the maximum at 235 nm is 360 to 390, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject the test solution and reference solution (b). Continue the chromatography for at least eight times the retention time of the main peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the sum of the areas of such peaks is at most three times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent).

***N,N*-Dimethylaniline** (2.4.26, *Method B*). Not more than 20 ppm.

2-Ethylhexanoic acid (2.4.28). Not more than 0.5 per cent *m/m*.

Loss on drying (2.2.32). Not more than 3.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Bacterial endotoxins (2.6.14): less than 0.05 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 25.0 mg of *cefotaxime sodium CRS* in the mobile phase and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Add 1.0 ml of *dilute hydrochloric acid R* to 4.0 ml of the test solution. Heat the solution at 40 °C for 2 h. Add 5.0 ml of *buffer solution pH 6.6 R* and 1.0 ml of *dilute sodium hydroxide solution R*.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: dissolve 3.5 g of *potassium dihydrogen phosphate R* and 11.6 g of *disodium hydrogen phosphate R* in 1000 ml of *water R* at pH 7.0 and add 180 ml of *methanol R*,
- as detector a spectrophotometer set at 235 nm,
- an injector with a fixed loop of 10 µl.

Inject reference solution (a) and reference solution (c). Adjust the attenuation to obtain principal peaks from reference solution (c) with a height of at least 50 per cent of the full-scale deflection of the recorder. The test is not valid unless cefotaxime is eluted as the second of the principal peaks and the resolution between the two principal peaks is at least 3.5. If necessary, use another stationary phase or

adjust the methanol content of the mobile phase. The test is not valid if the symmetry factor of the cefotaxime peak is greater than 2.0. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the area of the cefotaxime peak is at most 1.0 per cent. Inject alternately the test solution and reference solution (a).

STORAGE

Store in an airtight container, protected from light at a temperature not exceeding 30 °C. If the substance is sterile, store in an sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. R = R' = H: (6*R*,7*R*)-7-[[*(Z)*-2-(2-aminothiazol-4-yl)-2-methoxyiminoacetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (desacetocefotaxime),

B. R = OH, R' = H: (6*R*,7*R*)-7-[[*(Z)*-2-(2-aminothiazol-4-yl)-2-methoxyiminoacetyl]amino]-3-(hydroxymethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (desacetylcefotaxime),

C. R = O-CO-CH₃, R' = CHO: (6*R*,7*R*)-3-[(acetyloxy)methyl]-7-[[*(Z)*-2-[2-(formylamino)thiazol-4-yl]-2-(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (*N*-formylcefotaxime),

D. (6*R*,7*R*)-3-[(acetyloxy)methyl]-7-[[*(E)*-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (*E*-cefotaxime),

E. (5*aR*,6*R*)-6-[[*(Z)*-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetyl]amino]-5*a*,6-dihydro-3*H*,7*H*-azeto[2,1-*b*]furo[3,4-*d*][1,3]thiazine-1,7(4*H*)-dione (deacetylcefotaxime lactone).

CEFOXITIN SODIUM

Cefoxitinum natricum

 $C_{16}H_{16}N_3NaO_7S_2$ M_r 449.4**DEFINITION**

Sodium (6*R*,7*S*)-3-[(carbamoyloxy)methyl]-7-methoxy-8-oxo-7-[[thiophen-2-yl)acetyl]amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate.

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder, very hygroscopic.

Solubility: very soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: cefoxitin sodium CRS.

B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in carbon dioxide-free water *R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

pH (2.2.3): 4.2 to 7.0.

Dilute 2 ml of solution S to 20 ml with carbon dioxide-free water *R*.

Specific optical rotation (2.2.7): + 206 to + 214 (anhydrous substance).

Dissolve 0.250 g in methanol *R* and dilute to 25.0 ml with the same solvent.

Absorbance (2.2.25). Dissolve 0.100 g in water *R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with sodium hydrogen carbonate solution *R*. Examined between 220 nm and 350 nm, the solution shows an absorption maximum at 236 nm and a broad absorption maximum at about 262 nm. The specific absorbance at this broad maximum is 190 to 210 (anhydrous substance).

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use.

Solution A. Dilute 20 ml of a 34.8 g/l solution of dipotassium hydrogen phosphate *R* adjusted to pH 6.8 with phosphoric acid *R* to 1000 ml with water *R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in solution A and dilute to 10.0 ml with the same solution.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with solution A.

Reference solution (b). To 1.0 ml of the test solution add 7.0 ml of water *R* and 2.0 ml of methanol *R*. Add 25 mg of sodium carbonate *R*, stir for 10 min at room temperature, then heat in a water-bath at 70 °C for 30 min. Allow to cool. Add 3 drops of glacial acetic acid *R* and 1 ml of the test solution and mix.

Column:

– size: $l = 0.25$ m, $\varnothing = 4.6$ mm,

– stationary phase: phenylsilyl silica gel for chromatography *R* (5 μ m) with a specific surface area of 300 m²/g and a pore size of 7 nm.

Mobile phase:

– mobile phase A: water *R* adjusted to pH 2.7 with anhydrous formic acid *R*,

– mobile phase B: acetonitrile *R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 12	90	10
12 - 37	90 → 80	10 → 20
37 - 50	80 → 60	20 → 40
50 - 55	60 → 20	40 → 80
55 - 60	20	80
60 - 62	20 → 90	80 → 10
62 - 70	90	10

Flow rate: 1 ml/min.

Detection: spectrophotometer at 235 nm.

Injection: 50 μ l.

Relative retentions with reference to cefoxitin (retention time = about 34 min): impurity A = about 0.82; impurity B = about 1.16; impurity C = about 1.27; impurity D = about 1.31.

System suitability: reference solution (b):

– resolution: minimum 5.0 between the 2 principal peaks.

Limits:

– any impurity: not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

– total: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent),

– disregard limit: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.5.12): maximum 1.0 per cent, determined on 0.500 g.

Bacterial endotoxins (2.6.14): less than 0.13 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in water *R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 25.0 mg of cefoxitin sodium CRS in water *R* and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dissolve 20.0 mg of 2-(2-thienyl)acetic acid *R* in water *R* and dilute to 25.0 ml with the same solvent.

Reference solution (c). Mix 1.0 ml of reference solution (a) and 5.0 ml of reference solution (b).

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: acetic acid *R*, acetonitrile *R*, water *R* (1:19:81 *V/V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l; inject the test solution and reference solutions (a) and (c).

System suitability: reference solution (c):

- **resolution:** minimum 3.5 between the 2 principal peaks. Calculate the percentage content of cefoxitin sodium.

STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. (6*R*,7*S*)-3-(hydroxymethyl)-7-methoxy-8-oxo-7-[(thiophen-2-yl)acetyl]amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (decarbamoylcefexitin),

- B. (2*RS*,6*R*,7*S*)-3-[(carbamoyloxy)methyl]-7-methoxy-8-oxo-7-[(thiophen-2-yl)acetyl]amino]-5-thia-1-azabicyclo[4.2.0]oct-3-ene-2-carboxylic acid (delta-3-cefoxitin),

- C. $R = H$: (5*aR*,6*R*)-6-[(thiophen-2-yl)acetyl]amino]-5*a*,6-dihydro-3*H*,7*H*-azeto[2,1-*b*]furo[3,4-*d*][1,3]thiazine-1,7(4*H*)-dione (cefalotin lactone),

- D. $R = OCH_3$: (5*aR*,6*S*)-6-methoxy-6-[(thiophen-2-yl)acetyl]amino]-5*a*,6-dihydro-3*H*,7*H*-azeto[2,1-*b*]furo[3,4-*d*][1,3]thiazine-1,7(4*H*)-dione (cefoxitin lactone).

CEFRADINE

Cefradinum

$C_{16}H_{19}N_3O_4S$

M_r 349.4

DEFINITION

Cefradine contains not less than 90.0 per cent of (6*R*,7*R*)-7-[[[(2*R*)-2-amino-2-(cyclohexa-1,4-dienyl)acetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, calculated with reference to the anhydrous substance. The sum of the percentage contents of $C_{16}H_{19}N_3O_4S$ and of cefalexin ($C_{16}H_{17}N_3O_4S$; M_r 347.4) is not less than 95.0 per cent and not more than the equivalent of 102.0 per cent, calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellow, hygroscopic powder, sparingly soluble in water, practically insoluble in alcohol.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cefradine CRS*. If the spectra obtained in the solid state show differences, dissolve 30 mg of the substance to be examined and of the reference substance separately in 10 ml of *methanol R*, evaporate to dryness at 40 °C at a pressure less than 2 kPa and record new spectra using the residues.

TESTS

Solution S. Dissolve 2.50 g in *sodium carbonate solution R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1). Allow solution S to stand for 5 min. The absorbance of solution S measured at 450 nm (2.2.25) is not greater than 0.60.

pH (2.2.3). Dissolve 0.100 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 3.5 to 6.0.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *acetate buffer solution pH 4.6 R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 80 to + 90, calculated with reference to the anhydrous substance.

Absorbance (2.2.25). Dissolve 50.0 mg in *water R* and dilute to 100.0 ml with the same solvent. The absorbance measured at 330 nm is not greater than 0.05. Dilute 2.0 ml of the solution to 50.0 ml with *water R*. Examined between 220 nm and 300 nm, the diluted solution shows an absorption maximum at 262 nm. The specific absorbance at this maximum is 215 to 240, calculated with reference to the anhydrous substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance. Impregnate the plate by development with a 5 per cent *V/V*

solution of *tetradecane R* in *hexane R*. Allow the solvent to evaporate and carry out the chromatography in the same direction as the impregnation.

Test solution. Dissolve 0.25 g of the substance to be examined in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *dilute hydrochloric acid R*.

Reference solution (b). Dissolve 25 mg of *7-aminodesacetoxycephalosporanic acid CRS* in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid (*reference solution (b')*). Dilute 1 ml of this solution to 10 ml with *dilute hydrochloric acid R*.

Reference solution (c). Dissolve 25 mg of *cyclohexa-1,4-dienylglycine CRS* in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid (*reference solution (c')*). Dilute 1 ml of this solution to 10 ml with *dilute hydrochloric acid R*.

Reference solution (d). Dissolve 0.25 g of the substance to be examined in a mixture of 1 ml of reference solution (b') and 1 ml of reference solution (c') and dilute to 10 ml with *dilute hydrochloric acid R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *acetone R*, 80 volumes of a 72 g/l solution of *disodium hydrogen phosphate R* and 120 volumes of a 21 g/l solution of *citric acid R*. Dry the plate by heating at 90 °C for 3 min. Spray the hot plate with a 1 g/l solution of *ninhydrin R* in the mobile phase. Heat the plate at 90 °C for 15 min and allow to cool. In the chromatogram obtained with the test solution: any spot corresponding to 7-aminodesacetoxycephalosporanic acid is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent); any spot corresponding to cyclohexa-1,4-dienylglycine (the position of which is defined by comparison with the chromatogram obtained with reference solution (d)), is not more intense than the spot in the chromatogram obtained with reference solution (c) (1.0 per cent); any spot, apart from the principal spot and the spots corresponding to 7-aminodesacetoxycephalosporanic acid and to cyclohexa-1,4-dienylglycine, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows 3 clearly separated spots.

Cefalexin. Not more than 5.0 per cent, calculated with reference to the anhydrous substance and determined by liquid chromatography (2.2.29), as prescribed under Assay. Inject separately the test solution and reference solution (b).

***N,N*-Dimethylaniline** (2.4.26, *Method B*). Not more than 20 ppm.

Water (2.5.12). Not more than 6.0 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *cefradine CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *cefradine CRS* and 10.0 mg of *cefalexin CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm or 10 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 1 volume of *dilute acetic acid R*, 17 volumes of a 36.2 g/l solution of *sodium acetate R*, 200 volumes of *methanol R* and 782 volumes of *water R*,
- as detector a spectrophotometer set at 254 nm,
- a 20 µl loop injector.

Inject reference solution (b). Adjust the sensitivity of the detector so that the height of the peaks is at least half the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to cefalexin and cefradine is at least 4. If necessary, adjust the methanol content of the mobile phase. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the peak area for cefradine is at most 1.0 per cent. Inject separately the test solution and reference solution (a).

Calculate the percentage content of cefradine and cefalexin.

STORAGE

Store in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

01/2005:1405

CEFTAZIDIME

Ceftazidimum

$C_{22}H_{22}N_6O_7S_2 \cdot 5H_2O$

M_r 637

DEFINITION

Ceftazidime is (6*R*,7*R*)-7-[[*Z*]-2-[(2-aminothiazol-4-yl)-2-[(1-carboxy-1-methylethoxy)imino]acetyl]amino]-8-oxo-3-[(1-pyridinio)methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate pentahydrate. It contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{22}H_{22}N_6O_7S_2$, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water and in methanol, practically insoluble in acetone and in alcohol. It dissolves in acid and alkali solutions.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ceftazidime CRS*.

TESTS

Solution S. Dissolve 0.25 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 3.0 to 4.0.

Related substances

A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 0.100 g of the substance to be examined in a 36 g/l solution of *disodium hydrogen phosphate R* and dilute to 2.0 ml with the same solution.

Reference solution. Dilute 1 ml of the test solution to 200 ml with a 36 g/l solution of *disodium hydrogen phosphate R*.

Apply to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 6 volumes of *butanol R*, 26 volumes of *sodium acetate buffer solution pH 4.5 R*, 32 volumes of *butyl acetate R* and 32 volumes of *glacial acetic acid R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. Any spot with an *R_f* value greater than that of the principal spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

B. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *ceftazidime impurity A CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *ceftazidime impurity A CRS* and 5 mg of *ceftazidime CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.3 ml/min a mixture of 7 volumes of *acetonitrile R* and 93 volumes of a 22.6 g/l solution of *ammonium dihydrogen phosphate R*, adjusted to pH 3.9 with a 10 per cent *V/V* solution of *phosphoric acid R*,
- as detector a spectrophotometer set at 255 nm, maintaining the temperature of the column at 35 °C.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the heights of the 2 peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained, the resolution between the peaks corresponding to ceftazidime and impurity A is at least 5.9. Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography of the test solution for 3 times the retention time of ceftazidime. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram

obtained with reference solution (a) (2 per cent).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Impurity F. Not more than 500 ppm, determined by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.500 g of the substance to be examined in a 10 per cent *V/V* solution of *phosphate buffer solution pH 7.0 R4* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 1.00 g of *pyridine R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 200.0 ml with *water R*. To 1.0 ml of the solution, add 10 ml of *phosphate buffer solution pH 7.0 R4* and dilute to 100.0 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with a 10 per cent *V/V* solution of *phosphate buffer solution pH 7.0 R4*. To 1.0 ml of the solution add 20 ml of reference solution (a) and dilute to 200 ml with a 10 per cent *V/V* solution of *phosphate buffer solution pH 7.0 R4*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 8 volumes of a 28.8 g/l solution of *ammonium dihydrogen phosphate R* previously adjusted to pH 7.0 with *ammonia R*, 24 volumes of *acetonitrile R* and 68 volumes of *water R*,
- as detector a spectrophotometer set at 255 nm,

Inject 20 µl of reference solution (b). The test is not valid unless in the chromatogram obtained, the resolution between the peaks due to ceftazidime and to impurity F is at least 7.0.

Inject 20 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the area of the principal peak is at most 1.0 per cent. Inject alternately 20 µl of the test solution and 20 µl of reference solution (a).

Water (2.5.12): 13.0 per cent to 15.0 per cent, determined on 0.200 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *ceftazidime CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *ceftazidime impurity A CRS* in 5.0 ml of reference solution (a).

The chromatographic procedure may be carried out using:

- a column 0.15 m long and 4.6 mm in internal diameter packed with *hexylsilyl silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 2 ml/min a mixture prepared as follows: dissolve 4.26 g of *disodium hydrogen phosphate R* and 2.73 g of *potassium dihydrogen phosphate R* in 980 ml of *water R*, then add 20 ml of *acetonitrile R*,
- as detector a spectrophotometer set at 245 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the heights of the 2 principal peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless, in the chromatogram obtained, the resolution between the peaks corresponding to ceftriaxone and impurity A is at least 1.0. Inject alternately the test solution and reference solution (a). Calculate the percentage content of ceftriaxone.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

By liquid chromatography (related substances test): A, B, C.

By thin-layer chromatography (related substances test): D, E.

By liquid chromatography (impurity F test): F.

- A. (2*RS*,6*R*,7*R*)-7-[[[(*Z*)-2-(2-aminothiazol-4-yl)-2-[(1-carboxy-1-methylethoxy)imino]acetyl]amino]-8-oxo-3-[(1-pyridinio)methyl]-5-thia-1-azabicyclo[4.2.0]oct-3-ene-2-carboxylate (Δ-2-ceftazidime),

- B. (6*R*,7*R*)-7-[[[(*E*)-2-(2-aminothiazol-4-yl)-2-[(1-carboxy-1-methylethoxy)imino]acetyl]amino]-8-oxo-3-[(1-pyridinio)methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate,

- C. (6*R*,7*R*)-2-carboxy-8-oxo-3-(pyridinimethyl)-5-thia-1-azabicyclo[4.2.0]oct-2-en-7-aminium dichloride,

- D. (6*R*,7*R*)-7-[[[(*Z*)-2-[[2-(1,1-dimethylethoxy)-1,1-dimethyl-2-oxoethoxy]imino]-2-[[2-[(triphenylmethyl)amino]thiazol-4-yl]acetyl]amino]-8-oxo-3-(pyridinimethyl)-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate,

- E. (6*R*,7*R*)-7-[[[(*Z*)-2-(2-ammoniothiazol-4-yl)-2-[[2-(1,1-dimethylethoxy)-1,1-dimethyl-2-oxoethoxy]imino]acetyl]amino]-8-oxo-3-(pyridinimethyl)-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate chloride,

- F. pyridine.

01/2005:0991

CEFTRIAZONE SODIUM

Ceftriaxonum natricum

C₁₈H₁₆N₈Na₂O₇S₃, 3½ H₂O

M_r 662

DEFINITION

Disodium (6*R*,7*R*)-7-[[[(*Z*)-2-(2-aminothiazol-4-yl)(methoxyimino)acetyl]amino]-3-[[[(2-methyl-6-oxido-5-oxo-2,5-dihydro-1,2,4-triazin-3-yl)sulphonyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate.

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: almost white or yellowish, crystalline powder, slightly hygroscopic.

Solubility: freely soluble in water, sparingly soluble in methanol, very slightly soluble in ethanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: ceftriaxone sodium CRS.

B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.40 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅ or BY₅ (2.2.2).

Dilute 2 ml of solution S to 20 ml with *water R*.

pH (2.2.3): 6.0 to 8.0 for solution S.

Specific optical rotation (2.2.7): –155 to –170 (anhydrous substance).

Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 30.0 mg of *ceftriaxone sodium CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *ceftriaxone sodium CRS* and 5.0 mg of *ceftriaxone impurity A CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

- *size:* $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase:* octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: dissolve 2.0 g of *tetradecylammonium bromide R* and 2.0 g of *tetraheptylammonium bromide R* in a mixture of 440 ml of *water R*, 55 ml of 0.067 M phosphate buffer solution pH 7.0 R, 5.0 ml of citrate buffer solution pH 5.0 prepared by dissolving 20.17 g of *citric acid R* in 800 ml of *water R*, adjusting topH 5.0 with *strong sodium hydroxide solution R* and diluting to 1000.0 ml with *water R*, and 500 ml of *acetonitrile R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l; inject the test solution and reference solutions (b) and (c).

Run time: twice the retention time of ceftriaxone.

System suitability: reference solution (b):

- *resolution:* minimum of 3.0 between the peaks due to ceftriaxone and impurity A.

Limits:

- *any impurity:* not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1 per cent),
- *total:* not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (4 per cent),
- *disregard limit:* 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

N,N-Dimethylaniline (2.4.26, *Method B*): maximum 20 ppm.

2-Ethylhexanoic acid (2.4.28): maximum 0.8 per cent *m/m*.

Water (2.5.12): 8.0 per cent to 11.0 per cent, determined on 0.100 g.

Bacterial endotoxins (2.6.14): less than 0.20 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: test solution and reference solution (a).

Calculate the percentage content of ceftriaxone sodium.

STORAGE

In an airtight container protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. (6*R*,7*R*)-7-[[[(*E*)-(2-aminothiazol-4-yl)(methoxyimino)acetyl]amino]-3-[(2-methyl-5,6-dioxo-1,2,5,6-tetrahydro-1,2,4-triazin-3-yl)sulphonyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (*E*-isomer),

B. (5*aR*,6*R*)-6-[[[(*Z*)-(2-aminothiazol-4-yl)(methoxyimino)acetyl]amino]-5*a*,6-dihydro-3*H*,7*H*-azeto[2,1-*b*]furo[3,4-*d*][1,3]thiazine-1,7(4*H*)-dione,

C. 2-methyl-3-sulphonyl-1,2-dihydro-1,2,4-triazin-5,6-dione,

D. *S*-benzothiazol-2-yl (*Z*)-(2-aminothiazol-4-yl)(methoxyimino)thioacetate,

E. (6*R*,7*R*)-7-amino-3-[[2-methyl-5,6-dioxo-1,2,5,6-tetrahydro-1,2,4-triazin-3-yl]sulphonyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid.

01/2005:1300

CEFUROXIME AXETIL

Cefuroximum axetili

$C_{20}H_{22}N_4O_{10}S$

M_r 510.5

DEFINITION

Cefuroxime axetil contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of a mixture of the 2 diastereoisomers of (1*R*,5*S*)-1-(acetyloxy)ethyl (6*R*,7*R*)-3-[(carbamoyloxy)methyl]-7-[[2-(furan-2-yl)-2-(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate, calculated with reference to the anhydrous and acetone-free substance.

CHARACTERS

A white or almost white powder, slightly soluble in water, soluble in acetone, in ethyl acetate and in methanol, slightly soluble in alcohol.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *cefuroxime axetil CRS*.
- Examine the chromatograms obtained in the Assay. The retention time and size of the principal peaks in the chromatogram obtained with the test solution are the same as those of the peaks due to diastereoisomers A and B of cefuroxime axetil in the chromatogram obtained with reference solution (d).

TESTS

Diastereoisomer ratio. Examine by liquid chromatography (2.2.29) as described under Assay. In the chromatogram obtained with the test solution, the ratio of the peak due to cefuroxime axetil diastereoisomer A to the sum of the peaks due to cefuroxime axetil diastereoisomers A and B is between 0.48 and 0.55 by the normalisation procedure.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Calculate the percentage content of related substances from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, disregarding any peak with an area less than 0.05 times that of the 2 principal peaks in the chromatogram obtained with reference solution (a). The percentage sum of the pair of peaks corresponding to the *E*-isomers located by comparison with the chromatogram obtained with reference solution (c) is not greater than 1.0 per cent, the percentage sum of the pair of peaks corresponding to the Δ^3 -isomers located by comparison with the chromatogram obtained with reference solution (b) is not greater than 1.5 per cent and the area of any other secondary peak is not greater than 0.5 per cent. The sum of related substances is not greater than 3.0 per cent.

Acetone (2.4.24). Not more than 1.1 per cent.

Water (2.5.12). Not more than 1.5 per cent, determined on 0.400 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Prepare the solution immediately before use. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Heat 5 ml of the test solution at 60 °C for 1 h to generate the Δ^3 -isomers.

Reference solution (c). Expose 5 ml of the test solution to ultraviolet light at 254 nm for 24 h to generate *E*-isomers.

Reference solution (d). Prepare the solution immediately before use. Dissolve 10.0 mg of *cefuroxime axetil CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *trimethylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 38 volumes of *methanol R* and 62 volumes of a 23 g/l solution of *ammonium dihydrogen phosphate R*,
- as detector a spectrophotometer set at 278 nm.

Inject 20 μ l each of reference solutions (a), (b), (c) and (d). When the chromatograms are recorded in the prescribed conditions the retention times relative to cefuroxime axetil diastereoisomer A (second peak) are approximately 0.9 for cefuroxime axetil diastereoisomer B, 1.2 for the cefuroxime axetil Δ^3 -isomers and 1.7 and 2.1 for the *E*-isomers. The test is not valid unless in the chromatogram obtained with reference solution (d), the resolution between the peaks corresponding to cefuroxime axetil diastereoisomers A and B is at least 1.5. In the chromatogram obtained with reference solution (b), the resolution between the peaks corresponding to cefuroxime axetil diastereoisomer A and cefuroxime axetil Δ^3 -isomer is at least 1.5.

Inject reference solution (d) solution 6 times. The assay is not valid unless the relative standard deviation of the sum of the peaks corresponding to cefuroxime axetil diastereoisomers A and B is at most 2.0 per cent.

Calculate the percentage content of $C_{20}H_{22}N_4O_{10}S$ from the sum of areas of the two diastereoisomer peaks and the declared content of $C_{20}H_{22}N_4O_{10}S$ in *cefuroxime axetil CRS*.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. 1-(acetyloxy)ethyl (6R,7R)-3-[(carbamoyloxy)methyl]-7-[(Z)-2-(furan-2-yl)-2-(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-3-ene-2-carboxylate (Δ^3 -isomers),

- B. (1RS)-1-(acetyloxy)ethyl (6R,7R)-3-[(carbamoyloxy)methyl]-7-[(E)-2-(furan-2-yl)-2-(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate (E-isomers),

- C. R = CO-CCl₃: (6R,7R)-7-[(Z)-2-(furan-2-yl)-2-(methoxyimino)acetyl]amino]-8-oxo-3-[[[(trichloroacetyl)carbamoyl]oxy]methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,

- D. R = H: cefuroxime.

01/2005:0992

CEFUROXIME SODIUM

Cefuroximum natrium

C₁₆H₁₅N₄NaO₈SM_r 446.4

DEFINITION

Sodium (6R,7R)-3-[(carbamoyloxy)methyl]-7-[(Z)-2-(furan-2-yl)-2-(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate.

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder, slightly hygroscopic.

Solubility: freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: cefuroxime sodium CRS.

B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in carbon dioxide-free water R and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1). The absorbance (2.2.25) of solution S measured at 450 nm is not greater than 0.25.

pH (2.2.3): 5.5 to 8.5.

Dilute 2 ml of solution S to 20 ml with carbon dioxide-free water R.

Specific optical rotation (2.2.7): + 59 to + 66 (anhydrous substance).

Dissolve 0.500 g in acetate buffer solution pH 4.6 R and dilute to 25.0 ml with the same buffer solution.

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 25.0 mg of the substance to be examined in water R and dilute to 25.0 ml with the same solvent.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with water R.

Reference solution (a). Dissolve 25.0 mg of cefuroxime sodium CRS in water R and dilute to 25.0 ml with the same solvent. Dilute 5.0 ml to 50.0 ml with water R.

Reference solution (b). Place 20 ml of reference solution (a) in a water-bath at 80 °C for 15 min. Cool and inject immediately.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100.0 ml with water R.

Column:

- size: $l = 0.125$ m, $\varnothing = 4.6$ mm,
- stationary phase: hexylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: mix 1 volume of acetonitrile R and 99 volumes of an acetate buffer solution pH 3.4, prepared by dissolving 6.01 g of glacial acetic acid R and 0.68 g of sodium acetate R in water R and diluting to 1000 ml with the same solvent.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 273 nm.

Injection: 20 μ l loop injector; inject test solution (a) and reference solutions (b) and (c).

Run time: 4 times the retention time of cefuroxime.

System suitability: reference solution (b):

- resolution: minimum of 2.0 between the peaks due to cefuroxime and to impurity A.

Limits:

- impurity A: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- any other impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- total: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (3.0 per cent),

- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

***N,N*-Dimethylaniline** (2.4.26, *Method B*): maximum 20 ppm.

2-Ethylhexanoic acid (2.4.28): maximum 0.5 per cent *m/m*.

Water (2.5.12): maximum 3.5 per cent, determined on 0.400 g.

Bacterial endotoxins (2.6.14): less than 0.10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (a).

Calculate the percentage content of cefuroxime sodium.

STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. R = OH: (6*R*,7*R*)-7-[[*(Z)*-(furan-2-yl)(methoxyimino)acetyl]amino]-3-(hydroxymethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (descarbamoylcefuroxime),
- B. R = O-CO-CH₃: (6*R*,7*R*)-3-[(acetyloxy)methyl]-7-[[*(Z)*-(furan-2-yl)(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,
- C. R = H: (6*R*,7*R*)-7-[[*(Z)*-(furan-2-yl)(methoxyimino)acetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,
- D. R = O-CO-NH-CO-CCl₃: (6*R*,7*R*)-7-[[*(Z)*-(furan-2-yl)(methoxyimino)acetyl]amino]-8-oxo-3-[[[trichloroacetyl]carbamoyl]oxy]methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,

- E. R = O-CO-NH₂: (6*R*,7*R*)-3-[(carbamoyloxy)methyl]-7-[[*(E)*-(furan-2-yl)(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid (*trans*-cefuroxime),
- F. R = OH: (6*R*,7*R*)-7-[[*(E)*-(furan-2-yl)(methoxyimino)acetyl]amino]-3-(hydroxymethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,
- G. R = O-CO-CH₃: (6*R*,7*R*)-3-[(acetyloxy)methyl]-7-[[*(E)*-(furan-2-yl)(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,

- H. (5*aR*,6*R*)-6-[[*(Z)*-(furan-2-yl)(methoxyimino)acetyl]amino]-5*a*,6-dihydro-3*H*,7*H*-azeto[2,1-*b*]furo[3,4-*d*][1,3]thiazine-1,7(4*H*)-dione,

- I. (*Z*)-(furan-2-yl)(methoxyimino)acetic acid.

01/2005:1632

CELIPROLOL HYDROCHLORIDE

Celiprololi hydrochloridum

and enantiomer

C₂₀H₃₄ClN₃O₄

M_r 416.0

DEFINITION

3-[3-Acetyl-4-[(2*RS*)-3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]phenyl]-1,1-diethylurea hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or very slightly yellow, crystalline powder.

Solubility: freely soluble in water and in methanol, soluble in alcohol, very slightly soluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: celiprolol hydrochloride CRS.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

- B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Optical rotation (2.2.7): −0.10° to +0.10°.

Dissolve 1.0 g in *water R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 0.100 g of the substance to be examined in mobile phase A and dilute to 20.0 ml with mobile phase A.

Reference solution (a). Dissolve 2 mg of the substance to be examined and 2 mg of *acebutolol hydrochloride R* in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (b). Dissolve 10 mg of the substance to be examined in 2 ml of mobile phase A and allow to stand for 24 h (for identification of impurity A).

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 10.0 ml with mobile phase A.

Reference solution (d). Dissolve 10 mg of *celiprolol for peak identification CRS* in mobile phase A and dilute to 2 ml with mobile phase A.

Reference solution (e). This solution is only prepared if required (see below) and is used to determine the identity of impurity I which co-elutes with impurity H (the 2 impurities originate from different synthesis routes). Dissolve 2 mg of *celiprolol impurity I CRS* in mobile phase A and dilute to 20 ml with mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: octylsilyl silica gel for chromatography R (5 μ m),
- temperature: 30 °C.

Mobile phase:

- mobile phase A: mix 91 ml of *tetrahydrofuran R*, 63 ml of *acetonitrile R1*, 0.6 ml of *pentafluoropropanoic acid R* and 0.2 ml of *trifluoroacetic acid R*; dilute to 1000 ml with *water R*;
- mobile phase B: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 50	100 → 80	0 → 20
50 - 51	80 → 100	20 → 0
51 - 65	100	0

Flow rate: 1.4 ml/min.

Detection: spectrophotometer at 232 nm.

Injection: 10 μ l.

Relative retention with reference to celiprolol (retention time = about 10 min): impurity A = about 0.3; impurity D = about 0.7; impurity G = about 1.2; impurity B = about 1.4; impurity F = about 1.6; impurity C = about 2.2; impurity H or I = about 2.5; impurity E = about 3.9.

System suitability: reference solution (a):

- resolution: minimum 4.0 between the peaks due to celiprolol and acebutolol.

Limits: use the chromatogram supplied with *celiprolol for peak identification CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities B, E and F:

- correction factors: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 4.0; impurity B = 1.5; impurity E = 2.3; impurity F = 0.5; impurity I = 1.7;
- any impurity: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent), and not more than

1 such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent);

- total: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);
- if any of the above limits are exceeded and if a peak occurs with a relative retention of about 2.5 (impurity H or I), the identity of this peak has to be clarified by use of a UV spectrum recorded with a diode array detector; if this spectrum is different from the one obtained with reference solution (e), no correction factor is applied;
- disregard limit: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

ASSAY

Dissolve 0.350 g under an atmosphere of nitrogen in 50 ml of *alcohol R* and add 1.0 ml of 0.1 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 41.60 mg of $C_{20}H_{34}ClN_3O_4$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I.

- A. $R_1 = H$, $R_2 = NH-C(CH_3)_3$: 1-[5-amino-2-[(2*RS*)-3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]phenyl]ethanone,
- C. $R_1 = CO-NH-C(CH_3)_3$, $R_2 = NH-C(CH_3)_3$: 1-[3-acetyl-4-[(2*RS*)-3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]phenyl]-3-(1,1-dimethylethyl)urea,
- D. $R_1 = CO-N(C_2H_5)_2$, $R_2 = N(C_2H_5)_2$: 3-[3-acetyl-4-[(2*RS*)-3-(diethylamino)-2-hydroxypropoxy]phenyl]-1,1-diethylurea,
- H. $R_1 = CO-N(C_2H_5)_2$, $R_2 = Br$: 3-[3-acetyl-4-[(2*RS*)-3-bromo-2-hydroxypropoxy]phenyl]-1,1-diethylurea (bromhydrin compound),

- B. 1,3-bis[3-acetyl-4-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]phenyl]urea,

- E. 1,1'-[[[(1,1-dimethylethyl)imino]bis[(2-hydroxypropane-1,3-diyl)oxy(3-acetyl-1,4-phenylene)]]bis(3,3-diethylurea),

- F. R1 = R3 = H, R2 = CO-CH₃: 3-(3-acetyl-4-hydroxyphenyl)-1,1-diethylurea,
I. R1 = CO-CH₃, R2 = H, R3 = C₂H₅: 1-acetyl-1-(4-ethoxyphenyl)-3,3-diethylurea,

- G. 3-[3-acetyl-4-[(*RS*)-oxiranyl]methoxy]phenyl]-1,1-diethylurea.

01/2005:0887

CELLULOSE ACETATE

Cellulosi acetas

DEFINITION

Partly or completely *O*-acetylated cellulose.

Content: 29.0 per cent to 44.8 per cent of acetyl groups (C₂H₃O) (dried substance) and 90.0 per cent to 110.0 per cent of the acetyl content stated on the label (dried substance).

CHARACTERS

Appearance: white, yellowish-white or greyish-white powder or granules, hygroscopic.

Solubility: practically insoluble in water, soluble in acetone, in formic acid and in a mixture of equal volumes of methanol and methylene chloride, practically insoluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of cellulose acetate.*

TESTS

Free acid: maximum 0.1 per cent, calculated as acetic acid (dried substance).

To 5.00 g in a 250 ml conical flask, add 150 ml of *carbon dioxide-free water R*, insert the stopper, swirl the suspension

gently and allow to stand for 3 h. Filter, wash the flask and the filter with *carbon dioxide-free water R*. Combine the filtrate and washings. Add 0.1 ml of *phenolphthalein solution R1*. Titrate with 0.01 *M sodium hydroxide* until a faint pink colour is obtained.

1 ml of 0.01 *M sodium hydroxide* is equivalent to 0.6005 mg of free acid, calculated as acetic acid.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram of which not more than 10² fungi per gram determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

Cellulose acetate containing not more than 42.0 per cent of acetyl groups

To 2.000 g in a 500 ml conical flask add 100 ml of *acetone R* and 10 ml of *water R*. Close the flask and stir with a magnetic stirrer until dissolution is complete. Add 30.0 ml of 1 *M sodium hydroxide* with constant stirring. Close the flask and stir with a magnetic stirrer for 30 min. Add 100 ml of *water R* at 80 °C, washing down the sides of the flask, stir for 2 min and cool to room temperature. Titrate with 0.5 *M sulphuric acid*, using 0.1 ml of *phenolphthalein solution R* as indicator. Carry out a blank titration.

Calculate the percentage content of acetyl groups from the expression:

$$\frac{4.305 (n_2 - n_1)}{(100 - d) \times m} \times 100$$

d = loss on drying as a percentage,

m = mass of the substance to be examined, in grams,

*n*₁ = number of millilitres of 0.5 *M sulphuric acid* used in the test,

*n*₂ = number of millilitres of 0.5 *M sulphuric acid* used in the blank titration.

Cellulose acetate containing more than 42.0 per cent of acetyl groups

To 2.000 g in a 500 ml conical flask add 30 ml of *dimethyl sulphoxide R* and 100 ml of *acetone R*. Close the flask and stir with a magnetic stirrer for 16 h. Add 30.0 ml of 1 *M sodium hydroxide* with constant stirring. Close the flask and stir with a magnetic stirrer for 6 min. Allow to stand without stirring for 60 min. Add 100 ml of *water R* at 80 °C, washing down the sides of the flask, stir for 2 min and cool to room temperature. Titrate with 0.5 *M hydrochloric acid*, using 0.1 ml of *phenolphthalein solution R*. Add 0.5 ml of 0.5 *M hydrochloric acid* in excess, stir for 5 min and allow to stand for 30 min. Titrate with 0.5 *M sodium hydroxide*, until a persistent pink colour is obtained, stirring with a magnetic stirrer. Calculate the net number of millimoles of 0.5 *M sodium hydroxide* consumed, taking the mean of 2 blank titrations into consideration.

Calculate the percentage content of acetyl groups from the expression:

$$\frac{4.305 \times n}{(100 - d) \times m} \times 100$$

- d = loss on drying as a percentage,
 m = mass of the substance to be examined, in grams,
 n = net number of millimoles of 0.5 M sodium hydroxide.

STORAGE

In an airtight container.

LABELLING

The label states the nominal percentage content of acetyl groups.

01/2005:1406

CELLULOSE ACETATE BUTYRATE

Cellulosi acetas butyras

DEFINITION

Cellulose acetate butyrate is partly or completely *O*-acetylated and *O*-butyrylated cellulose. It contains not less than 2.0 per cent and not more than 30.0 per cent of acetyl groups (C_2H_3O) and not less than 16.0 per cent and not more than 53.0 per cent of butyryl groups (C_4H_7O) calculated with reference to the dried substance. Both the acetyl content and the butyryl content are not less than 90.0 per cent and not more than 110.0 per cent of those stated on the label, calculated with reference to the dried substance.

CHARACTERS

A white, yellowish-white or greyish-white powder or granules, slightly hygroscopic, practically insoluble in water and in alcohol, soluble in acetone, in formic acid and in a mixture of equal volumes of methanol and methylene chloride.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of cellulose acetate butyrate*. The intensities of the bands may vary according to the degree of substitution.
 B. It complies with the limits of the assay.

TESTS

Acidity. To 5.00 g in a 250 ml conical flask, add 150 ml of *carbon dioxide-free water R*, insert the stopper, swirl the suspension gently and allow to stand for 3 h. Filter, wash the flask and the filter with *carbon dioxide-free water R*. Combine the filtrate and washings. Add 0.1 ml of *phenolphthalein solution R1*. Not more than 3.0 ml of 0.01 M sodium hydroxide is required to change the colour of the indicator.

Heavy metals (2.4.8). 1.0 g complies with limit test F for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 3 h.

Total ash (2.4.16). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. To 1.000 g in a 500 ml conical flask, add 100 ml of *acetone R* and 10 ml of *water R*. Close the flask and stir with a magnetic stirrer until dissolution is complete. Add 30.0 ml of 1 M sodium hydroxide with constant stirring. Close the flask and stir with a magnetic stirrer for 30 min. Add 100 ml of hot *water R* at 80 °C, washing down the sides of the flask and stir for 2 min. Cool, centrifuge or filter the suspension and wash the residue with *water R*. Combine the filtrate and washings, adjust the pH to 3 (2.2.3) using *dilute phosphoric acid R* and dilute to 500.0 ml with *water R*.

Reference solution. Dissolve 0.200 g of *glacial acetic acid R* and 0.400 g of *butyric acid R* in *water R*, adjust the pH to 3 (2.2.3) using *dilute phosphoric acid R* and dilute to 500.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.2 ml/min a mixture of 5 volumes of *methanol R* and 95 volumes of *phosphate buffer solution pH 3.0 R1*, changing after 30 min, by linear gradient elution over 5 min, to a mixture of 20 volumes of *methanol R* and 80 volumes of *phosphate buffer solution pH 3.0 R1* and eluting for a further 25 min. Restore the initial solvent mixture for 1 min,
- as detector a spectrophotometer set at 210 nm.

Inject successively 20 µl of the reference solution and 20 µl of the test solution.

Calculate the percentage contents of acetic acid and butyric acid in the substance to be examined from the peak areas in the chromatograms obtained with the two solutions.

To calculate the percentage contents of acetyl (C_2H_3O) and of butyryl (C_4H_7O) groups, multiply the percentage contents of acetic acid and of butyric acid by 0.717 and 0.807, respectively.

STORAGE

Store in an airtight container.

LABELLING

The label states the nominal percentage content of acetyl and butyryl groups.

01/2005:0314

CELLULOSE ACETATE PHTHALATE

Cellulosi acetas phthalas

DEFINITION

Partly *O*-acetylated and *O*-phthalylated cellulose.

Content:

- phthaloyl groups ($C_8H_5O_3$, relative mass of the group 149.1): 30.0 per cent to 36.0 per cent (anhydrous and acid-free substance).
- acetyl groups (C_2H_3O , relative mass of the group 43.05): 21.5 per cent to 26.0 per cent (anhydrous and acid-free substance).

CHARACTERS

Appearance: white, free-flowing powder or colourless flakes, hygroscopic.

Solubility: practically insoluble in water, freely soluble in acetone, soluble in diethylene glycol, practically insoluble in ethanol and in methylene chloride. It dissolves in dilute solutions of alkalis.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of cellulose acetate phthalate.

TESTS

Viscosity (2.2.9): 45 mPa·s to 90 mPa·s for the apparent viscosity determined at 25 °C.

Dissolve 15 g, calculated with reference to the anhydrous substance, in 85 g of a mixture of 1 part of *water R* and 249 parts of *acetone R*.

Free acid: maximum 3.0 per cent, calculated as phthalic acid (anhydrous substance).

Shake 3.0 g for 2 h with 100 ml of a 50 per cent V/V solution of *methanol R* and filter. Wash the flask and the filter with 2 quantities, each of 10 ml, of a mixture of a 50 per cent V/V solution of *methanol R*. Combine the filtrate and washings, add *phenolphthalein solution R* and titrate with 0.1 M *sodium hydroxide* until a faint pink colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 8.3 mg of free acid, calculated as phthalic acid.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 5.0 per cent, determined on 0.500 g.

Carry out the test using a mixture of 2 volumes of *methylene chloride R* and 3 volumes of *ethanol R*.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Phthaloyl groups. Dissolve 1.000 g in 50 ml of a mixture of 2 volumes of *acetone R* and 3 volumes of *alcohol R*. Add 0.1 ml of *phenolphthalein solution R* and titrate with 0.1 M *sodium hydroxide* until a faint pink colour is obtained. Carry out a blank titration.

Calculate the percentage content of phthaloyl groups (*P*) from the expression:

$$\frac{14\,900n}{(100 - a)(100 - S)m} - \frac{179.5S}{(100 - S)}$$

- a* = percentage content of water,
m = mass of the substance to be examined, in grams,
n = number of millilitres of 0.1 M *sodium hydroxide* used,
S = percentage content of free acid (see Tests).

Acetyl groups. To 0.100 g add 25.0 ml of 0.1 M *sodium hydroxide* and heat on a water-bath under a reflux condenser for 30 min. Cool, add 0.1 ml of *phenolphthalein solution R* and titrate with 0.1 M *hydrochloric acid* until the colour is discharged. Carry out a blank titration.

Calculate the percentage content of acetyl groups from the expression:

$$\left[\frac{4300(n_2 - n_1)}{(100 - a)(100 - S)m} - \frac{51.8S}{(100 - S)} \right] - 0.578P$$

- a* = percentage content of water,
m = mass of the substance to be examined, in grams,
*n*₁ = number of millilitres of 0.1 M *hydrochloric acid* used in the test,
*n*₂ = number of millilitres of 0.1 M *hydrochloric acid* used in the blank titration,
P = percentage content of phthaloyl groups,
S = percentage content of free acid (see Tests).

STORAGE

In an airtight container.

01/2005:0316

CELLULOSE, MICROCRYSTALLINE

Cellulosum microcristallinum

DEFINITION

Purified, partly depolymerised cellulose prepared by treating alpha-cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

CHARACTERS

Appearance: white or almost white, fine or granular powder.

Solubility: practically insoluble in water, in acetone, in ethanol, in toluene, in dilute acids and in a 50 g/l solution of sodium hydroxide.

IDENTIFICATION

- A. Place about 10 mg on a watch-glass and disperse in 2 ml of *iodinated zinc chloride solution R*. The substance becomes violet-blue.
- B. The degree of polymerisation is not more than 350. Transfer 1.300 g to a 125 ml conical flask. Add 25.0 ml of *water R* and 25.0 ml of *cupriethylenediamine hydroxide solution R*. Immediately purge the solution with *nitrogen R*, insert the stopper and shake until completely dissolved. Transfer 7.0 ml of the solution to a suitable capillary viscometer (2.2.9). Equilibrate the solution at 25 ± 0.1 °C for at least 5 min. Record the

flow time t_1 in seconds, between the 2 marks on the viscometer. Calculate the kinematic viscosity ν_1 of the solution using the formula:

$$t_1 (k_1)$$

where k_1 is the viscometer constant.

Dilute a suitable volume of *cupriethylenediamine hydroxide solution R* with an equal volume of *water R* and measure the flow time t_2 using a suitable capillary viscometer. Calculate the kinematic viscosity ν_2 of the solvent using the formula:

$$t_2 (k_2)$$

where k_2 is the viscometer constant.

Determine the relative viscosity η_{rel} of the substance to be examined using the formula:

$$\nu_1 / \nu_2$$

Determine the intrinsic viscosity $[\eta]_c$ by interpolation, using the intrinsic viscosity table (Table 0316-1).

Calculate the degree of polymerisation P using the formula:

$$\frac{95 [\eta]_c}{m [(100 - b) / 100]}$$

where m is the mass in grams of the substance to be examined and b is the loss on drying as a percentage.

TESTS

Solubility. Dissolve 50 mg in 10 ml of *ammoniacal solution of copper tetrammine R*. It dissolves completely, leaving no residue.

pH (2.2.3): 5.0 to 7.5 for the supernatant liquid.

Shake 5 g with 40 ml of *carbon dioxide-free water R* for 20 min and centrifuge.

Table 0316-1. – *Intrinsic viscosity table*
